

## **Psycholinguistics, Developmental Linguistics**

Convenor: Guillaume Thierry

This immersive section of ICL 2024 will explore the intricate ways in which cognitive processes underpin language acquisition and use. Language should no longer be considered a separate, encapsulated, self-contained, and idiosyncratic module in the human mind, but rather a fully distributed and integrated system that interacts with other cognitive mechanisms, such as perception, attention, learning, emotion, and decision-making, all of which are now being explored from a psycholinguistic perspective. We invite contributions that dissect the mental mechanisms of language learning across the lifespan, from infancy to adulthood. Join us to engage with cutting-edge research in speech perception and production and share insights on cognitive and social dimensions of language development, language diversity, and multilingualism.
