Corpus Linguistics

Convenor: Maciej Ogrodniczuk

We invite papers that examine the methods and applications of corpus linguistics, a subfield of linguistics that uses large collections of natural language data to study linguistic phenomena and patterns. Topics may include the design and construction of corpora, the analysis and interpretation of corpus data, the use of corpus tools and software, and the implications of corpus findings for various linguistic domains and disciplines. The focus stream also explores the challenges and opportunities of corpus linguistics in the era of big data, artificial intelligence, and natural language processing.
