

The Linguistic Society of Korea

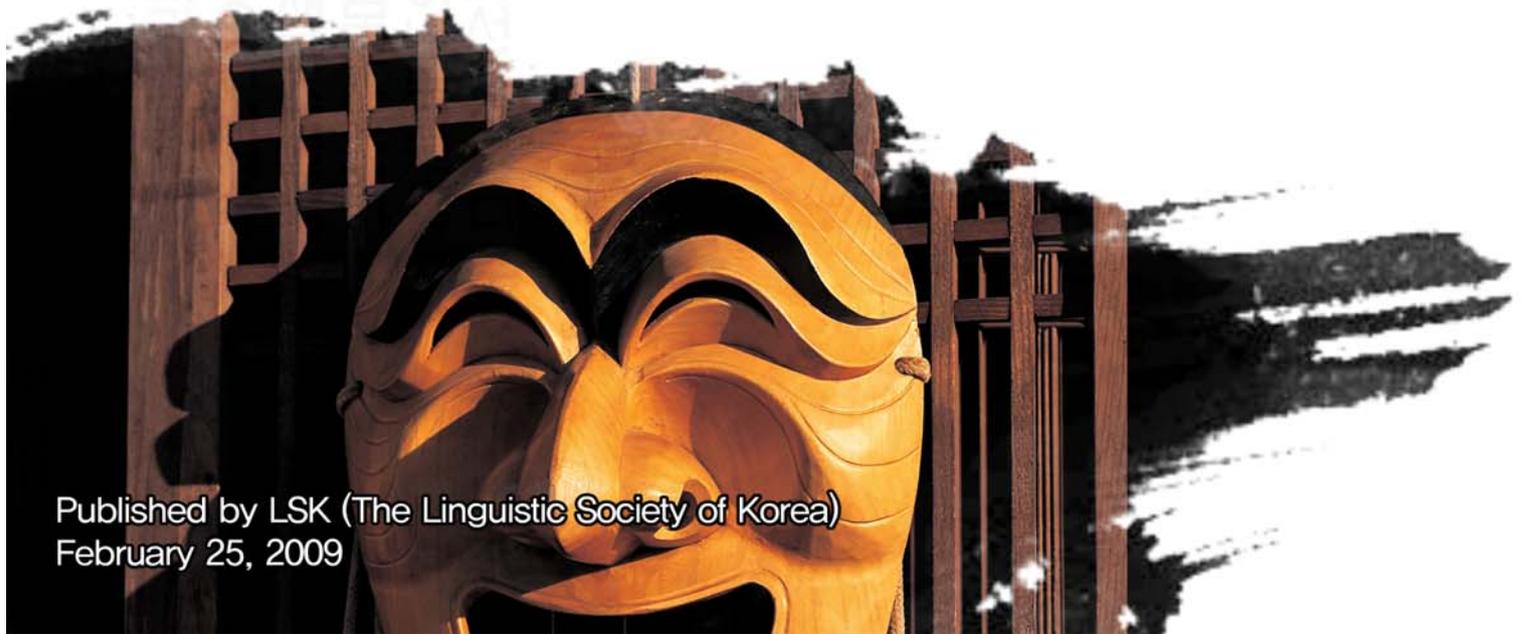

# Current Issues in Unity and Diversity of Languages

Collection of the papers selected from the CIL 18,  
Held at Korea University in Seoul,

on July 21~26, 2008

Vertical Korean text on the left side of the cover, including the title and event details.

Published by LSK (The Linguistic Society of Korea)  
February 25, 2009

## **Current Issues in Unity and Diversity of Languages**

*Collection of the papers selected from the CIL18,  
Held at Korea University in Seoul*

The Linguistic Society of Korea

# - Table of Contents -

## I. Designated Topics

### 1. Language, mind and brain

Brain Activity during Production of Synonym vs. Antonym: a Functional MRI Study	Hyeon-Ae Jeon Kyoung-Min Lee	Seoul National University Seoul National University	1
Boundedness of Nouns and the Usage of English Articles	Il-Kon Kim Kwanghee Lee	Hanyang University Hanyang University	14
Cognitive perspectives of language switching: Factors of bilingualism and development	John W. Schwieter	Wilfrid Laurier University	27
On the Temporality of Human Language	Ning Chunyan	Institute of Linguistics Tianjin Normal University, Tianjin, China	43
Logical systems and natural logical intuitions	Pieter A.M. Seuren	Max Planck Institute for Psycholinguistics	53
Is there a linear ordering of the semantic representation at the syntax-semantics interface?	Rainer Dietrich Chung Shan Kao Werner Sommer	Dept. of German Language and Linguistics, Dept. of Psychology Humboldt-Universität zu Berlin	61
Dual Aspectual Meanings of the Verb <i>chac-ta</i> ‘look for/find’ in Korean: A Window to Event and Mind	Sejin Yoo Yoonhee Choi Chungmin Lee	Seoul National University	72
Cognitive basis of semantic changes	Vera Zabolotkina	Moscow State Linguistic University	88
What the Avoidance of a Highly Grammaticalized Morpheme In SLA Tells Us: The Case of L2 Chinese	Yu LIU	Sun Yat-sen University	99
A Game-Theoretic Interpretation of the Ontological Homology between Language and Consciousness	Yukio Takahashi	Morioka College	108

### 2. Information structure

Japanese particle <i>shika</i> ‘only’	Akio Hasegawa	University at Buffalo, The State University of New York	119
Partial Accommodation and Activation in Definites	Arndt Riester	University of Stuttgart	134
Stress and Strength by Clitics in Slovenian	Boštjan Dvořák	ZAS Berlin	153
On the variability of focus meanings	Dejan Matić	Max Planck Institute for Evolutionary Anthropology	176
The Korean Focus Particle <i>-lato</i> and Weak Additivity	Dongsik Lim	University of Southern California	192
The myth of Hungarian focus	Edgar Onea Gaspar	University of Stuttgart	211
Focus, contrast, and the syntax-phonology interface: The case of French cleft-sentences	Fatima Hamlaoui	Université Paris Sorbonne Nouvelle	230
Topic-focus and focus-topic: the first and foremost motivation of Ancient Greek word order	Giuseppe G. A. Celano	Università Cattolica di Milano	251
A Compositional Approach to the Topic-Comment Articulation in Japanese	Hiroaki Nakamura	Japan Coast Guard Academy	261

On Information Packaging of Topicalized and Scrambled Sentences in Japanese	Hiroshi Aoyagi Sachiko Kato	Nanzan University MIT and Tohoku University	276
Contrastive topic marking in Gbe	Ines Fiedler	Humboldt University of Berlin	295
Deriving the properties of structural focus	Katalin É. Kiss	the Hungarian Academy of Sciences	309
Focus and the Typology of Questions: a non-derivational approach to inter- and intra-language variation	Louise Mycock	University of Manchester	324
The Given-New Distinction: Insights from Inferreds	Petra B. Schumacher	Max Planck Institute for Psycholinguistics	359
Second Occurrence Focus in German	Stefan Baumann Doris Mücke Johannes Becker	IfL Phonetik, University of Cologne	374
The Effect of Lexical Tone and Focus on the Formation of F0 in Vietnamese	Stefanie Jannedy	Center for General Linguistics (ZAS)	394
The marking of given and new information on Mandarin DE construction in mother-child conversation	Tuyuan Cheng Hintat Cheung	National Taiwan University National Tainan Institute of Nursing	413
The topic that gradually ran away from home	Yi-An Lin	Department of Linguistics, University of Cambridge	432
Information Structure and Sentence Formation in Matengo	Yoneda Nobuko	Osaka University	443
Exhaustive Focus in Japanese	Yoshihisa Kitagawa	Department of Linguistics, Indiana University	454
A Puzzle of Contrastive Wa in Japanese	Yukio Furukawa	McGill University	475

### 3. Language policy

The Charter of Regional and Minority Languages as a political factor	Camiel Hamans	Dutch delegation PSE-group	490
Immigrant Languages and the Dilemma of the Welfare State. A Case Study of Arabic in the Danish Educational Sector.	Helle Lykke Nielsen	University of Southern Denmark	503
The transcription of personal names: the Japanese passport	Joseph DeChicchis	Kwansei Gakuin University	518
Empowering African languages: Focus on Tanzania and Namibia	Karsten Legère	University of Gothenburg	530
Theory Development Process Towards Language Management and Policy: Examining Students' Beliefs (Language Orientations) in the JFL Classroom	Nariyo Kono	Department of Applied Linguistics Portland State University	543
Language Policy-Planning and the Interactive 'Turn': the Case of the European Union	Patrick Studer Mi-Cha Flubacher Felicia Kreislermaier	Department of Linguistics, University of Bern	566

Unplanned Policy: Planned Results Situating English in the Language Education Policy of Nepal	Ram Ashish Giri	Monash University, Melbourne	579
Language Policy in Germany and Beyond	Wolfgang Viereck	University of Bamberg	594

#### 4. Intercultural pragmatics, language and society

Crafting multilingual and intercultural identities in talk: I know a little about your language	Erica Zimmerman	United States Naval Academy	603
What the emergence of AUTOLINGUALS says about the status of EAGLF in the ubiquitous age	Fusa Katada	Waseda University	617
The creation of polite mitigation in cyber-dialect in light of the theory of Communities of Practice	Kazuko Tanabe	Japan Women's University	627
Reinterpreting intercultural moments: A case of peer discussions among foreign graduate students in Japan	Keiko Ikeda	Nagoya University	641
Internationalismen in globalen Diskursen am Beispiel des Deutschen und Japanischen	Werner, Angelika	Dokkyo University, Tokyo, Faculty of Foreign Languages, Prof.	655
Is There a "Drift" Towards Universal English-Based Rhetorical Patterns?	William G. Eggington	Brigham Young University, Department of Linguistics and English Language	670
Foreigner Talk at English Corner: An Intercultural Pragmatic Perspective	Xinren Chen	Nanjing University, China	682

#### 5. Historical and comparative linguistics

How bad is "bad data"? In search for the features of orality in Early Modern English legal texts	Barbara Kryk-Kastovsky	Universität Wien	699
The 3rd Person Singular Exception in Slavic	Boštjan Dvořák	ZAS Berlin	710
Language history meets typology: Relevance-driven Change in German Verbs	Damaris Nübling Antje Dammel	University of Mainz Johannes Gutenberg Universität	713
English word-formation, combining forms and neo-classical compounds: a reassessment	Dieter Kastovsky	Universität Wien	724
The Role of Prosody and Morphology in the Evolution of C'est-clefts in Medieval French	Jacynthe Bouchard Monique Dufresne Fernande Dupuis	Université du Québec à Montréal Queen's University in Kingston Université du Québec à Montréal	735
A formal model of grammaticalization in Slavic past tense constructions	Jesse Tseng	CNRS & Université de Toulouse Le Mirail	749
Cross-linguistically unusual features of Welsh are declining	John D. Phillips	Yamaguchi University	763
THE PROBLEM OF THE INTERPRETATION OF THE BORROWED CHARACTERS IN OLD KOREAN LITERATURE, THE HYANGGA	Jung-Hee An	University of Hamburg	775

Classical Studies and the Emergence of Comparative Linguistics: What was lost and what was gained?	Kurt R. Jankowsky	Georgetown University	786
Rendaku Immunity and Prosodic Size	Mark Irwin	Yamagata University, Faculty of Literature and Social Sciences	806
Passive morphology relating Korean to the Transeurasian languages	Martine Irma Robbeets	Johannes Gutenberg University Mainz	824
Probabilistic OT approach to sa-Insertion in Japanese: Based on the corpus data	Shin-ichiro SANO	Sophia University	839
Is Anger HEAT or QI in Chinese? A Historical Perspective	Tung-chu Chen	Department of English, National Taiwan Norman University	857
Kaingang and Austronesian – Similarities between Geographically Distant Languages	Vladimir Pericliev	Mathematical Linguistics Dpt., Institute of Mathematics & Informatics	875

## 6. Phonetics and phonology

Predicting innovative alternations in Korean verb paradigms	Adam Albright Yoonjung Kang	Massachusetts Institute of Technology University of Toronto Scarborough	893
La liaison en français Quelques conditionnements morphosyntaxiques et lexicaux	Bernard Laks Denis Le Pesant	Université Paris Ouest & CNRS: MoDyCo Université Paris Ouest & CNRS: MoDyCo	914
Convergence and Divergence in Language Obsolescence	Charles B. Chang	University of California, Berkeley	933
Consonant Gemination in Japanese Loanword Phonology	Haruo Kubozono Junko Itô Armin Mester	Kobe University University of California at Santa Cruz University of California at Santa Cruz	953
A Phonetic Analysis of the Prosody of Hebrew-Speaking Children with High-Functioning Autism	Hila Green Yishai Tobin	Ben-Gurion University of the Negev Ben-Gurion University of the Negev	974
Perception of voicing in fricatives	Hyesun Cho Maria Giavazzi	MIT MIT	986
Lyman's Law Effect in Japanese Sequential Voicing: Questionnaire-Based Nonword Experiments	Mutsuko Ihara Katsuo Tamaoka Tadao Murata	St. Marianna University School of Medicine Reitaku University Kyushu Institute of Technology <sup>3</sup>	1007
Is marked less frequent? Polish word-final consonantal sequences in a dictionary	Paula Orzechowska	Adam Mickiewicz University, Poznań	1019
How Levels of Consonantal Similarity Interact with Vocalic Information in L1-L2 Consonant-/i/ Syllabic Identification	Sally Chen Janice Fon	Graduate Institute of Linguistics, National Taiwan University	1034
Perception and production patterns of Korean phonemic contrasts by Japanese L2 learners	Seokyung Park Yasushi Tsubota Naoshi Hiraoka Masatake Dantsuji	Kyoto University	1045

Loanword adaptation between Korean-Japanese plosives and the role of perception	Shigeko SHINOHARA Seong-Rim Ji Kanae AMINO Tomohiko OOIGAWA	Sophia University	1060
Compensatory Lengthening is not Specific to Syllabic Positions	Te-hsin Liu	Department of Linguistics, Paris 8 University	1074
Individual differences in production of voicing of French /Ø/ sounds and the perception by Japanese adult listeners*	Tomohiko OOIGAWA	Sophia University	1094
Hetero-syllabic Split L-Geminates: English in Singapore and Hong Kong	Wee, Lian Hee	Hong Kong Baptist University	1112
Understanding VOT Variation in Spontaneous Speech	Yao Yao	Linguistics Department, University of California, Berkeley	1122
Resolving Conflicts of Prominence in Music and Speech	Young-mee Yu Cho Mariko Saiki	Rutgers University Kanazawa University	1138
Adaptation of English interdental fricatives by speakers of Taiwan Mandarin	Yu-an Lu	Stony Brook University	1151

## 7. Lexical semantics

Problems Encountered in the Research of the Voice System in an endangered language	Atsuko UTSUMI	Meisei University	1165
Causative and Politeness	Chikako Shigemori-Bučar	University of Ljubljana	1179
Argument Structure Binding and Event Nominal Polysemy	Elisabetta Jezek	Pavia University	1189
Latvian Motion Verbs: Telicity Aspect	Gunta Nešpore	Univ of Latvia	1210
The Morphology and Semantics of Hybrid Lettered Words in Chinese Short title: Hybrid Lettered Words in Chinese	Helena Riha Kirk Baker	The Ohio State University The Ohio State University	1222
A New Evaluation Method for the Graph Clustering of Semantic Networks Built from Lexical Co-occurrence Information	Hiroyuki Akama Maki Miyake Jaeyoung Jung	Tokyo Institute of Technology University of Osaka Tokyo Institute of Technology	1234
How Discourse/Cognitive Factors Can Influence Argument Realisation: A Case of Object Omission	Kensei Sugayama	Kyoto Prefectural University	1250
Building and aligning Chinese and French paradigmatic Graphs	Laurent Prévot Bruno Gaume Chu-Ren Huang Chao-Jan Chen Shu-Kai Hsieh	CLLE-ERSS, CNRS, Université de Toulouse CLLE-ERSS, CNRS, Université de Toulouse Institute of Linguistics, Academia Sinica Institute of Linguistics, Academia Sinica Institute of Linguistics, Academia Sinica	1271
Adduction/Abduction et Catégorisation Lexicale	Mbame Nazaire	L.R.L, UBP Clermont-Ferrand, France.	1274

V-V Compounds in Japanese and Deixis	Noriko Matsumoto	Kobe University	1290
Eyes and Hands Expressions: Embodiment of Lexical Meanings	Shelley Ching-yu Hsieh Elena Kolodkina	National Cheng Kung University Cheng Shiu University	1307
Overtalented and Talented beyond measure: Bound and free morphemes as scalarity operators in English and French	Silvia Adler Maria Asnes	University of Haifa, French Department Bar Ilan University French Department	1339
The semantics of the verb of giving in Thai and Vietnamese : A contrastive study	Suthatip Mueanjai	Department of Linguistics, Chulalongkorn University	1353
When Two Kinds of Mandarin Collective Modifiers Meet Two Kinds of Control	Wei-Chih Chuang Mao-Hsun Chen Chih-Hao Weng	National Kaohsiung Normal University National Tsing-Hua University National Kaohsiung Normal University	1365
TOWARDS AN INVENTORY OF SEMANTIC CLASSES, FOR ABSTRACT NOUNS	Xavier Blanco	Universitat Autònoma de Barcelona	1378

## 8. Tense, aspect and modality

Modelling 'the perfect', a category between tense and aspect	Anna Kibort	University of Surrey	1390
Tense in Taiwan Sign Language	Chien-hung LinJung-hsing Chang	National Chung Cheng University National Chung Cheng University	1405
Reported Speech in Russian and Italian: Verbs of Speech and Particles	Elizaveta Khachatryan	University of Oslo	1425
On the Difference in Existential Meaning of Two Aspectual Markers in Modern Korean: the Relation between -ko iss-, -e iss- and the Existence verb iss-	Kim, Kyung-Ae	Kyoto University	1436
Perfect Versus Past in Korean*	Kyung-Sook Chung	Pusan National University	1449
On Tense-Aspect-Mood in Polar Interrogatives	Matti Miestamo	Helsinki Collegium for Advanced Studies	1465
Multiple analytical perspectives of the Eleme Anterior-Perfective	Oliver Bond	School of Oriental and African Studies	1480
Irrealis and conditional structures: a temporal and/or aspectual issue?	Patrick Caudal	CNRS & Université Paris 7	1497
Modality, tense and aspect in Japanese conditionals	Seiko Fujii	University of Tokyo, Dept. of Language and Information Sciences, Graduate School of Arts and Sciences,	1515
Global Applicability of NURIGEUL for Literacy Program and Multilingual Word-processing	Sek Yen Kim-Cho	State University of New York at Buffalo	1530
Modal, Temporal, and Evidential Aspects of Reduced Quotative Constructions in Korean	Suk-Jin Chang	Seoul National University	1554
Modality vs. illocution on the example of Japanese expressions of obligation and advice	Sylwia Staniak	Kyoto University	1571
Subjectification and Grammaticalization: A Case Study of Modal Auxiliaries in Japanese and Korean	Tetsuharu Moriya Yong-Taek Kim	Kanazawa University University of Oregon	1582

## 9. Computational linguistics

Similarity and Dissimilarity in Treebank Grammars	Markus Dickinson	Indiana University	1597
Linearization of Syntactic Dependency Graphs in terms of Traversal Algorithms	Miyoko Yasui	Dokkyo University	1612
Geographic Information Systems (GIS) in Linguistic Research. Studies, Data and Future Perspectives	Oliver Streiter	National University of Kaohsiung	1628
TimeML Challenges for Morphological Languages: A Korean Case Study	Seohyun Im Roser Saurí	Lab for Linguistics and Computation Computer Science Department	1638
An Exemplar-based Approach to Automatic Burst Detection in Spontaneous Speech	Yao Yao	University of California, Berkeley	1653
Implementation of Syntax and Semantics of Questions in Computational Minimalism	Yong-hun Lee	Dept. of English Language & Literature, Chungnam National University	1669

## 10. Syntax

Subjunctive-Negation Interaction in Persian	Ali Darzi	University of Tehran	1684
Number Agreement in a Sign Language	Anne-Marie Parisot Denis Bouchard	Université du Québec à Montréal Université du Québec à Montréal	1696
An Experimental Investigation into Scope Rigidity in Japanese	Chung-hye Han Dennis Ryan Storoshenko Yasuko Sakurai	Simon Fraser University Simon Fraser University Simon Fraser University	1710
Verbs projecting as Nouns	Han-Byul Chung	Seoul National University	1722
Possible Patterns of A'-Chains in Relative Clauses in Ulster Irish	Hideki Maki Dónall P. Ó Baoill	Gifu University Queen's University Belfast	1738
A usage-based account of verbal reduplication in Taiwan Southern Min	Hui-Ju Chuang James H-Y. Tai	National Chung Cheng University National Chung Cheng University	1755
Types of Double Nominative Constructions in Korean	Jisung Sun	Stony Brook University	1765
A Movement Approach to Case Alternations in Korean	Jong Un Park	Georgetown University	1781
A Unified Approach to the Peculiarities of Comparative Inversion	Kwang-sup Kim	Hankuk University	1795
Resumptives in Mandarin: Syntactic versus Processing Accounts	Li-Hsin Ning Chien-Jer Lin	National Chengchi University National Taiwan Normal University	1815
A Uniform Hypothesis of Count/Mass Expressions New Syntactic Evidence	Mario Saltarelli	University of Southern California	1835
Clause patterns and the semantics-syntax interface. Towards a sender's grammar of Estonian	Peep Nemvalts	Tallinn University	1845
Talmy's Typological Generalization Revisited: A Morphosyntactic Account	Seiki Ayano	Faculty of Humanities, Law and Economics, Mie University	1859

On the Subject of the Japanese Middle and Tough Constructions*	Shigeki Taguchi Fumikazu Niinuma	University of Connecticut, Department of Linguistics Kochi Gakuen College, Department of Early Childhood Education and Care	1875
Another Middle Construction in Taiwanese Southern Min: buebai+V	Shih-Yin Chiang	National Tsing Hua University	1887
A Lexical Analysis of Korean Relative and Topic Constructions: Gaps, Island Constraints, and Resumptive Pronouns	Sun-Hee Lee	Wellesley College	1919
The Light Verb Construction in Japanese and PF-LF Mismatch in Argument Linking	Toru Ishii	Meiji University	1937
Statistical Anatomy of Unacceptability	Yoshihisa Kitagawa Kenji Yoshida	Department of Linguistics, Indiana University, Bloomington	1954

## II. Workshop

### 1. English with Asian accents

ELT in East and Southeast Asia – Parodic Insights into Prevailing Ideologies and Practises	Glenn Toh	Tama University	1974
The Use of Singlish Particles in the Singapore Classroom	GWEE Susan	Nanyang Technological Univeristy	1987

### 2. Speech sciences in linguistics

Production and perception of English voiceless sibilants by Korean ESL learners	Sang Yee Cheon	University of Hawai'i at Mānoa	1998
The (perceived) authenticity of Irish accent in film	Shane Walshe	University of Bamberg, Germany	2011
An OT Analysis of the Nasal Pronunciation Variability in Coda Position---Transfer Effect or Unmarkedness Constraint	Ya-Ting Yang	NationalKaohsiung Normal University (R.O.C.)	2030

### 3. Formal approaches to the relations of tense, aspect and modality

Building temporal structure: Adverbs and times	Aniko Csirmaz	University of Utah	2040
Aspect shifts in Indo-Aryan	Cleo Condoravdi Ashwini Deo	Palo Alto Research Center Yale University	2057
Scoping over epistemics in English and in Dutch	Janneke Huitink	University of Nijmegen	2077
A Time-Relational Approach to Aspect in Mandarin Chinese and English	Mingya Liu	University of Tübingen	2090
Aspect markers in two dialects of Japanese and Korean: Variation and division of labor	Saeko Urushibara	University of Kitakyushu	2110

### 4. Contrastiveness in information structure and/or scalar implicatures

The interpretation of a "contrast-marking" particle	Beáta Gyuris	Research Institute for Linguistics, HAS, Budapest	2130
Focus Particle Mo and Many/Few Implicatures on Numerals in Japanese	Chidori Nakamura	Iwate University	2149

Interpretations of numerals and structured contexts	Jae-Il Yeom	Hongik University	2167
Partition Semantics and Pragmatics of Contrastive Topic	Katsuhiko Yabushita	Naruto University of Education	2183
Almost et al.: Scalar adverbs revisited	Laurence R. Horn	Yale University	2203
Scales and non-scales in (Hebrew) child language	Leah R. Paltiel-Gedalyovich Jeannette Schaeffer	Department of Foreign Literatures and Linguistics, Ben-Gurion University of the Negev	2223
Negative Implicatum, Positive Implicatum	Mingya Liu	University of Tübingen	2236
Topic, Focus, and Exhaustive Interpretation	Robert van Rooij	Universiteit van Amsterdam	2256
A Scope Theory of Contrastive Topics	Satoshi Tomioka	Department of Linguistics and Cognitive Science, University of Delaware	2282
Scalar Implicatures, Presuppositions, and Discourse Particles: Colloquial Russian –to, že, and ved’ in Combination	Svetlana McCoy-Rusanova	Rutgers University, USA	2297
Adversative Predicates: With Reference to Nonveridicality and Expletive Negation	Yoonhee Choi Chungmin Lee	Seoul National University	2312

## 5. Language diversity

Wh-Constructions in Saisiyat	Cheng-Yu Edwin Tsai	National Tsing Hua University	2334
The tension between language documentation and descriptive linguistics - the case of deictic motion verbs in Hocak	Johannes Helmbrecht Iren Hartmann	University of Regensburg University of Wisconsin-Madison	2349
Interrogatives in Sri Lankan Sign Language	Kano Mitsuru	Nagaoka University of Technology	2364
Clitic and its Tonal Behavior in Akan	Kyoko Koga	Kochi University	2379
Possessor Raising and Noun Incorporation: A Case of Alutor in Russian Far East	Yukari Nagayama	Research Institute for Languages and Cultures of Asia and Africa, Tokyo University of Foreign Studies	2389

## 6. Writing systems and the linguistic structure

Language Policy for China’s Minorities: Orthography Development for the Yi	David Bradley	La Trobe University	2399
Discrepancies between Sounds and Graphs in Chinese Characters	Ik-sang Eom	Hanyang University	2411
The Nurigeul Writing System for Preliterate Chepang	In Bean Lim	Korea University	2421
Ambiguity in Homographic Kanji and Disambiguation through Okurigana	Keisuke Honda	University of Tsukuba	2436
Choice of Voices in Maya Hieroglyphic Writing	Kosuke Matsukawa	State University of New York at Albany	2451
The Emblematic Script of the Aztec Codices as a Particular Semiotic Type of Writing System	Ludmila L. Fedorova	Institute of Linguistics, Russian State University for Humanities, Moscow	2471

The Emblematic Principle in the Evolution of Writing Systems	Ludmila L. Fedorova Elena N. Kondratyeva	Institute of Linguistics, Russian State University for Humanities, Moscow Institute of Linguistics, Russian State University for Humanities, Moscow	2479
A Formal Model of Writing: Writing Systems, Scripts, Writing Standards, Orthographies and their Interactions	Oliver Streiter	National University of Kaohsiung	2493
The Korean Alphabet: An Optimized Featural System with Graphical Ingenuity	Sang-Oak Lee	Seoul National University	2511

## 7. Current issues in linguistic interfaces

A Syntax-Semantics Interface Study of Predicative Shi in Mandarin Chinese Copular Construction	Li, Larry Hong-lin	Department of English, National Taiwan Normal University	2519
Syntax and Semantics of Negation	Suwon Yoon	University of Chicago	2541
Productivity and Constraint in Morphology and Lexicon	Weon-Don Jeong	Semyung University	2559

## 8. Language and gender

Japanese women's language: Ideological constructs and changing gender roles	Barry Kavanagh	Aomori University of Health and Welfare	2575
The Influence of Gender on the Prosody of Buenos Aires Spanish	Claudia Enbe Yishai Tobin	Ben-Gurion University of the Negev Ben-Gurion University of the Negev	2595
Social Status and Intimacy in the Characters of Shakespeare	V.K. JAIN	Govt. Girls' P.G. College, Khandwa, India	2610

## 9. Second language acquisition and applied linguistics

Implications of a study on L2 interlanguage phonology for the learning of L2 pronunciation: The phonological variants of the syllable initial /n-/ in L2 English produced by Cantonese speakers in Hong Kong	Cecilia Yuet Hung Chan	City University of Hong Kong	2624
E-tailing English Language Teaching	Jamie Shinhee Lee	University of Michigan-Dearborn	2640
The Minimal English Test: A New Method to Measure English as a Second Language Proficiency	Kenichi Goto Hideki Maki Chise Kasai	Gifu University Gifu University Gifu University	2654
Perception versus Production in Korean L2 Acquisition of English Sibilant Fricatives	Robert Allen Fox Ewa Jacewicz Fred R. Eckman Gregory K. Iverson Soyoung Lee	The Ohio State University The Ohio State University University of Wisconsin-Milwaukee University of Maryland Center for Advanced Study of Language University of Wisconsin-Milwaukee	2662
The discourse of the teacher of Portuguese as a foreign language and the building of textual competence	Roberval Teixeira e Silva	University of Macau, FSH –Department of Portuguese	2681

## 10. Linguistic studies of ontology

Cornetto Tools and Methodology for Interlinking Lexical Units, Synsets and Ontology	Aleš Horák Piek Vossen Adam Rambousek Isa Maks Roxane Segers	Masaryk University Vrije Universiteit van Amsterdam Masaryk University Vrije Universiteit van Amsterdam Vrije Universiteit van Amsterdam	2695
Linguistically Conventionalized Ontology of Four Artifact Domains: A Study Base on Chinese Radicals	Chu-Ren Huang Sheng-Yi Chen Tzu-Yi Kuo Shu-Kai Hsieh  Ya-Min Chou	Institute of Linguistics, Academia Sinica Institute of Linguistics, Academia Sinica Institute of Linguistics, Academia Sinica Department of English, National Taiwan Normal University Department of International Business, Ming Chuan University	2714
Ontological representation of event structure across languages: the case of psych verbs	Evguenia Malaia	Purdue University	2727
An Ontology-based Account of Argument Selection in Nominals	Naoyuki Ono	Tohoku University	2741

## 11. Endangered languages

Endangered Mongolian Dialects in the North-western China	B. Sechenbaatar	Inner Mongolia University	2755
To save language is to save ethnos (on experience of the Kalmyk language revitalisation)	BITKEEVA Aisa	Institute of Linguistics of Russian Academy of Sciences	2762
The vocabulary of games and competitions non-involved in Altaic studies (from Tungusic-Manchurian and Turkic languages)	Gavril Robbek	Institute of the Humanities and the Indigenous Peoples of the North of SB RAS	2776
About creating the grammatical terminology in the Evenki language	Kirill Struchkov	Institute of the Humanities and the Indigenous Peoples of the North of SB RAS	2781
Some variations of vowels in spoken Manchu	KO Dongho KIM Juwon	Chonbuk National University Seoul National University	2785
Revival movement of the Warrongo language (Australia): Progress report (2008)	Tasaku Tsunoda Mie Tsunoda	University of Tokyo Rissho University	2974
Preliminary Report on Fieldwork Studies on Mongolian Languages and Dialects	Wonsoo Yu	Seoul National University	2812
A Web-Accessible Dictionary of Southeastern Pomo	Yao Yao Charles B. Chang Shira Katseff Russell Lee-Goldman Marta Piqueras-Brunet	University of California, Berkeley	2824
Endangered Turkic Languages — Preliminary Report on Fieldwork Studies —	Yongsong Li	Seoul National University	2836

## 12. Argument realization in Asian languages

Does Quantity Figure in Aps?	Chinfa Lien	National Tsing Hua University	2858
Argument Unification in the Quasi-Existential Construction	Chizuru Ito	Osaka University	2868
The grammar of hitting and breaking (and cutting) in Kimaragang Dusun	Paul R. Kroeger	Graduate Institute of Applied Linguistics & SIL Intl.	2885
Identifying non-realized arguments in Vietnamese: a lexical orientation approach to argument structure	Theresa Hanske	Department of Linguistics, University of Cologne	2900

## 13. Lexis-grammar interface

Comment représenter le sens grammatical des verbes supports dans un dictionnaire actif : le cas des verbes supports en coréen	Seong Heon Lee	Seoul National University	2917
Représentation d'informations lexico-syntaxiques du lexique-grammaire : à propos de certains verbes "à montée"	Takuya Nakamura	Université Paris-Est, Institut Gaspard-Monge	2934
When Lexical Meanings Meet Constructions: "V-ge-N" Versus "V-CL-N" Constructions in Mandarin Chinese	Yu-Fen Yao	National Taiwan University	2948

## 14. Interfaces in phonology

Korean Vowel Harmony and Grammatical Change	Hijo Kang	Stony Brook University	2962
Korean Palatalization as Coarticulation: Stroboscopic cine-MRI and acoustic data on gradual tongue movements	Hyunsoon Kim	Hongik University	2983
Paradox of Negative and Honorific Morphology in Korean	Inkie Chung	University of Seoul	2999
Opacity, Phonetics, and Frequency in Taiwanese Tone Sandhi	Jie Zhang Yuwen Lai Craig Sailor	The University of Kansas	3019

## 15. Languages and cultures in contact

Loans and Language Contact Models in Algonquian and French Cree	Boštjan Dvořák Patrick Steinkrüger	ZAS Berlin	3039
---	---------------------------------------	------------	------

## III. General Topic

Solving Post-positional Ambiguity: A Lexical Filtering Device for Hindi Simple Sentences	Amitabh Vikram Dwivedi	Shri Mata Vaishno Devi University	3052
Linguistic Markers of Information Structure in Latvian	Baiba Saulīte	University of Latvia	3067

A Bound-Variable Analysis of the Korean Anaphor caki: Evidence from Corpus	Chung-hye Han Dennis Ryan Storoshenko	Simon Fraser University Simon Fraser University	3077
A dynamic approach to the semantics of almost and barely	Debra Ziegeler	National University of Singapore	3092
Two Types of Case Alternation in Mongolian	Dolgor Guntsetseg Udo Klein	University of Stuttgart University of Stuttgart	3114
The Tonal Structures and the Locations of the Main Accent of Kyungsang Korean Words	Dongmyung Lee	Indiana University	3129
Systemics and geolinguistics: evidence and testimony in Middle Alsace	Erich Weider	University of Applied Sciences Western Switzerland (HES-SO)	3149
Coordination of Iterative Terms in Romanian – A Contrastive Study	Gabriela Bilbiie	University Paris 7	3157
Interactional Aspects of Sharedness of Information in Korean Conversation	Haeyeon Kim	Chung-Ang University	3173
A Comparative Study of English Loanword Abbreviations in Japanese and Korean	Haeyeon Kim Young-Cheol Yim	Chung-Ang University Chung-Ang University	3194
Processing Efficiency and Multiple Factors Affecting Case Marking in Korean: A Unified Account	Hanjung Lee	Sungkyunkwan University	3214
On the issue of argument alternation -with special reference to locative verbs-	Heesook Kim	Korea National University of Education	3232
On the Argument Structure of Ditransitive Verbs in Japanese	Hideki Kishimoto	Kobe University	3252
La tautologie et la notion subjective de "désirabilité"	Hiroshi Abé	Tohoku University	3266
No Movement Analysis of Scrambling	Hong-Pin Im	Seoul National University	3279
The effects of vowel quality on stress placement of English nonsense words	Hyo-young Kim	Kookmin University	3304
On the Nature of the Dative Case in Korean Dative Experiencer Constructions	Ilkyu Kim	Hankuk University	3310
Dialectal variations on the syllable-final nasal merger in Taiwan Mandarin	Janice Fon Jui-mei Hung	National Taiwan University National Taiwan University	3330
A Discourse Analysis of Language Scaffolding: In a Cross-age Tutoring Program	Ji Young Kim	University of Florida	3350
Discovering in Which Mode of Language Production Korean Speakers Show More Native-Like English Proficiency: Speech or Writing?	Jongmin Song	Kyung-Hee University	3367
Discourse Dependency and Intervention Effects	Ju Hyeon Hwang	University of Illinois, Urbana-Champaign	3383

Analysis of Linguistic Expressions for motion events in English, German and Korean	Kangho Lee	Hanyang University	3397

## Abstract

Word retrieval is selecting a word from the mental lexicon, given a lexical concept to be expressed. The uses of functional magnetic resonance imaging (fMRI) to measure activity-related changes in the brain have provided various possibilities to resolve the question about word retrieval. In this study, we examined the neural correlates involved in processing synonym and antonym. The commonly activated areas across all conditions were middle frontal gyrus (BA9) and inferior occipital gyrus (BA18). Additional examination of cortical activation in middle frontal gyrus between synonym and antonym showed that processing synonym, even though the activated brain areas of synonym were found in the neighborhood of that of antonym, yielded slightly but exclusively different activations distinguished from processing antonym. The results may present an interesting and refreshingly new viewpoint in the question of word retrieval from mental lexicon.

**Keywords:** word retrieval, synonym, antonym, fMRI.

## 1. Introduction

It is commonly presumed that semantic relations between words – antonymy, synonymy, hyponymy and so on – are reflected in the organization of word storage in the brain (Katz, 1972; Kempson, 1977; Pustejovsky, 1995), but neural mechanisms of such organization, or of word storage in general, still remain to be elucidated. The question we address here is what is the neural substrates involved in processing the two different semantic relations, synonymy and antonymy. The reason we concentrated on these two specific relations is that synonymy is the most important semantic relation based on the fact that judging similarities is a prerequisite for representing meanings in

the mental lexicon and antonymy is the semantic relation which is parallel to synonymy (Miller & Fellbaum, 1991).

The definition of synonymy and antonymy used in our study should be explained first. Miller and Fellbaum (1991) provided a good definition of synonyms: “two expressions are synonymous if the substitution of one for the other never changes the truth value of a sentence in which the substitution is made.” A weakened version of this definition was also widely accepted: if two expressions are synonymous in a context, even though one substitutes the other, it does not change the truth value of the context. As for antonymy, a lexical circumstance bound with oppositeness is generally accepted (Murphy and Andrew, 1993). In fact, there are several kinds of antonym with different internal sense structures such as polar antonyms, equipollent antonyms, overlapping antonyms (Cruse, 1986). However, we will not go into details about the subtypes of antonyms because those distinctions will not be relevant to the issues discussed in our experiment. Some may argue that the all kinds of antonyms were mingled in our study. The aim of this experiment, however, is not about examining the neural substrates of various subdivisions of antonym but of the general process of retrieving antonymy regardless of its subtypes.

It has been suggested that both synonyms and antonyms can be generated based on different features as well as similar features. What matters is that the different features play a major role in antonyms whereas they function as a minor role in synonyms. Previous studies have examined the nature of synonymy and antonymy supporting the feature composition of semantic relations. For instance, Kadesh and his colleagues (1976) discovered that when subjects listened dichotically to pairs of words such as synonyms, antonyms, coordinates, and super-subordinates, all four conditions of semantic relations facilitated more accurate identification, as compared with unrelated control pairs and this effect was weakest in antonyms among four relations. In an attempt to explain the lowest level of facilitation in antonyms, the authors suggested that opposite features which were inherent in antonymy canceled out some of the benefits deriving from commonalities in semantic relations: subjects drew more attention to the opposing features rather than commonalities for the words and this oppositeness inhibited the recognition of dichotically presented words.

Hampton and Taylor (1985) also supported the feature composition of antonyms. In same-different categorization task, relatedness between words facilitated both same and different judgments equally in antonyms whereas facilitation effect was shown only in the same responses with nonantonyms. In discussing results, they supposed a word with two dimensions, substantiveness and evaluativeness. According to this, if one word

is antonym of the other word, they must have opposite features in both dimensions. For example, the antonym of brave is cowardly because semantic features of cowardly reverse both the substantive dimension of cautiousness and the positive evaluation of brave. Prudent cannot be an antonym of brave because only the features in substantive dimension are reversed while those in evaluation dimension stay same in positive evaluation. This finding suggested that the oppositeness of features in substantive and evaluative dimension matters most in identifying antonyms.

Previous neuroimaging studies have not been proliferated in the direct comparison of retrieving synonyms and antonyms. Synonymy and antonymy have been used, in most neuroimaging studies, as stimuli in various tasks: a generation or recognition in semantic memory (Nyberg et al., 2003, Martin et al., 2003, Roskies et al., 2001), bilingual functional-imaging study for word generation (Klein, et al., 1995), the effect of overt verbal fluency on the prefrontal cortex (Phelps, et al., 1997), and abstract and concrete word retrieval (Noppeney and Price, 2004). To the best of our knowledge, it is very hard to find a study in which generating or retrieving synonymy and antonymy is a main issue of study aims. Therefore, the aim of our study was to explore the neural correlates of processing synonymy and antonymy. We expected the different involvement of cognitive process for generating synonyms and antonyms would result in the distinguished neural substrates in human brain.

## **2. General Methods**

### *2.1. Subjects*

Twelve subjects (7 females, mean age 23, age range 21-30) participated in the experiment. All were right-handed, with Korean as their native language and no history of neurological disorders. Each gave informed consent to participate in the study was paid for his or her participation.

### *2.2. Materials and Procedure*

Synonym and antonym conditions consisted of various word sets: Synonym (SYN) [(i) English loanwords (ENG), i.e. a word directly taken into Korean from English with no translation (ii) sino-Korean (CHI), (iii) honorific words (HON)] and Antonym (ANT). Control task was reading nonwords (NW). Each set contained fifty

words and they were matched item by item across each of five lists on a range of psycholinguistic variables such as frequency (not in NW), length, and syllable number. For a control task, nonword condition (NW) was used to remove the effect of visual processing and reading with 50 nonwords.

Subjects underwent five runs of generation task. Each run consisted of an initial 30s baseline epoch of fixation on a central cross, followed by five 30s periods of activation epoch of SYN (ENG, CHI, HON), ANT, NW, alternating with five periods of fixation. Within the activation epoch, word stimulus was displayed at a rate of 3s, total 10 words in one epoch. As our task was intended to be a block-design study, the order of five activation epochs within a run was randomized. There were no repetitions of the same stimuli. Subjects were instructed to retrieve a word according to the displayed condition-indicator of ENG, CHI, HON, ANT, and NW. The indicator was presented beneath the first stimulus word of every activation epoch. In NW condition, subjects simply read displayed words. Immediately after completing the functional imaging portion of this study, subjects performed the same task as what they had done inside of the MRI scanner. They were told to write down exactly the same responses as they gave in scanner.

Visual stimuli were rear projected to a screen visible to subjects in the scanner using an LCD projector. A mirror was mounted to the head coil to allow subjects to view the screen.

### *2.3. fMRI imaging parameters*

A 1.5 T whole-body scanner (Avanto, Siemens, Erlangen, Germany) with echo planar imaging capability was used for image acquisition. The standard RF coil provided with the scanner was used. Based on a scout image of the midline sagittal plane, 28 slices were positioned parallel to the AC-PC line. T2\*-weighted functional images were acquired at the same slice locations using an interleaved EPI gradient echo sequence (TR: 3 sec; TE: 40 msec; flip angle: 90; field of view: 220mm; matrix size: 64 x 64; slice thickness: 5 mm separation). We acquired 192 sagittal T1-weighted slices for each subject (TR: 600; TE: 7.8ms; flip angle: 90degree; field of view: 220mm; matrix size: 256X256; slice thickness: 0.9mm separation).

### *2.4. Data analysis*

The data were analyzed with statistical parametric mapping (using SPM5

software from the Wellcome Department of Imaging Neuroscience, London; <http://www.fil.ion.ucl.ac.uk/spm>) implemented in Matlab (Mathworks Inc. Sherborn, MA). Scans from each subject were realigned using the fourth as a reference (the first three scans were removed to allow for the magnetization to reach dynamic equilibrium), spatially normalized. (Friston et al., 1995) into standard space (Talairach and Tournoux, 1988), resampled to 4 X 4 X 4 mm<sup>3</sup> voxels and spatially smoothed with a Gaussian kernel of 8mm FWHM.

Overall patterns of activations were obtained by a fixed-effect analysis on data pooled over all subjects. Statistical inferences on task and condition differences were then performed with a random effect model to render the results of the inference generalizable to the population. Condition-specific effects for each subject were estimated according to the general linear model (Friston et al., 1995) and passed to a second-level analysis as contrasts. This involved creating contrast images of [each condition (SYN, ANT, NW) > baseline] for each subject and a second level ANOVA, which modeled these effects of interest. Inferences were made at the second level to emulate a random effects analysis and enable inferences at the population level (Friston et al., 1999). At the second level, we tested for (i) SYN > NW and (ii) ANT>NW to examine if there were any activation areas specific to each condition. To reveal common effects at the voxel level across independent conditions and data sets, we performed conjunction analysis which was assessed as significant at a conjoint  $\alpha$  level of  $p < 0.05$ . This means that both contrasts were individually significant at thresholds with a joint probability of a Type I being less than 0.05.

### 3. Results

#### 3.1. Behavioral results

Behavioral results showed that subjects performed the task successfully above the 90% accuracy. The mean scores (% correct) and standard deviation are shown in Table 1.

Table 1. Mean accuracy of each task and its standard deviation(SD)

Condition	Accuracy	
	% Correct	SD
ENG	97.9	0.6
CHI	90.2	0.9
HON	90.5	1.4
ANT	96.4	0.8

## 3.2. *Imaging results*

### 3.2.1 *The Comparison of Synonym and Antonym*

Three steps of data analysis were performed in this study. In the first step, SYN and ANT conditions were compared with baseline condition (watching fixation). Table 2 showed the Talairach coordinates of the regions where showed significant activations for SYN and ANT. They were also displayed with functional activation images rendered on a canonical brain in Fig 1. These activations were yielded by the overall baseline contrast ( $P < 0.001$ , corrected). SYN and ANT commonly activated the middle occipital gyrus and the middle frontal gyrus in the left hemisphere. Some other spatial extent of activations in each condition was obtained in the right fusiform gyrus (BA20), and superior parietal lobe (BA7) in SYN whereas precuneus and inferior parietal lobe (BA7) was observed in ANT when they were compared with baseline condition.

In the second step, to identify areas participated in the process of retrieving synonym and antonym, direct comparison of SYN>NW and ANT>NW was executed. Each condition revealed several significant increases in regional activity and signal changes compared with NW task ( $p < 0.001$ , uncorrected). Coordinates of significant activation were shown in Table 2. Rendered brain image of the activations and plots of the % signal change of the local maxima were depicted in Fig.2. Every condition displayed greater signal increase than NW ( $t(18)= 6.84$ ,  $p=.02$  for SYN and  $t(18)=15.04$ ,  $p=.005$  for ANT).

In the third step, we defined an ROI (region of interest) in the areas where the two conditions exhibited significant signal increase in comparison to NW and scrutinized the distinct distribution of activated areas between each condition in Fig.3. Here, the compared conditions were color-coded in red and green indicating areas that were activated in SYN>NW and ANT>NW each. Within the left middle frontal gyrus, more anterior and lateral part was recruited in processing ANT (green area) compared to SYN condition (red area).

Table 2. Regions of significant activation for SYN and ANT.

	Side	Cortical area	BA	Talairach coordinate			Z-score	Cluster size
				x	y	z		
<i>Comparison with watching fixation</i>								
SYN	L	Middle occipital gyrus	19	-40	-74	0	5.15	269
	L	Middle frontal gyrus	9	-51	17	32	4.91	318
	L	Middle temporal gyrus	21	-53	-31	-14	4.89	285
	R	Fusiform gyrus	20	40	-40	-15	4.87	244
	L	Superior parietal lobule	7	-28	-63	55	4.4	129
ANT	L	Middle occipital gyrus	19	-40	-74	0	4.44	96
	L	Middle frontal gyrus	9	-40	13	29	3.7	70
	L	Middle temporal gyrus		-60	-46	-10	3.58	67
	L	Precuneus	7	-28	-60	40	3.53	15
	L	Inferior parietal lobule	40	-44	-37	42	3.37	13
<i>Comparison with NW</i>								
SYN	L	Middle frontal gyrus	46	-40	17	25	4.29	45
	L	Superior parietal lobule	7	-28	-64	44	3.77	14
ANT	L	Middle Frontal Gyrus	46	-51	25	25	4	10

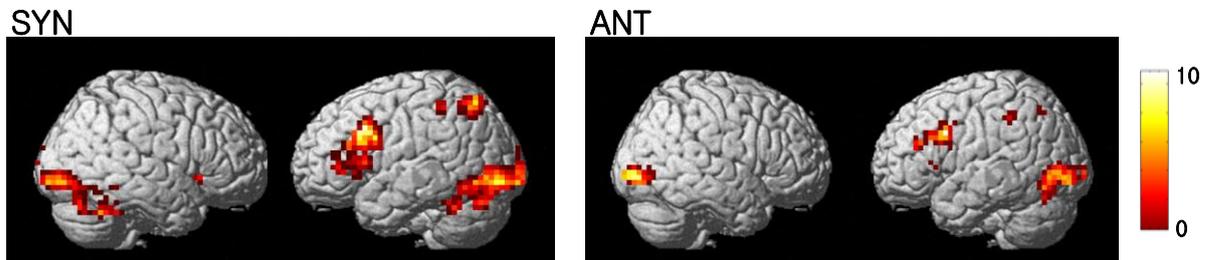

Figure 1. Cortical areas where the MR signal was significantly higher ( $p < .001$ , uncorrected) when SYN and ANT were compared with baseline task were displayed on a three-dimensional brain model template provided in SPM5.

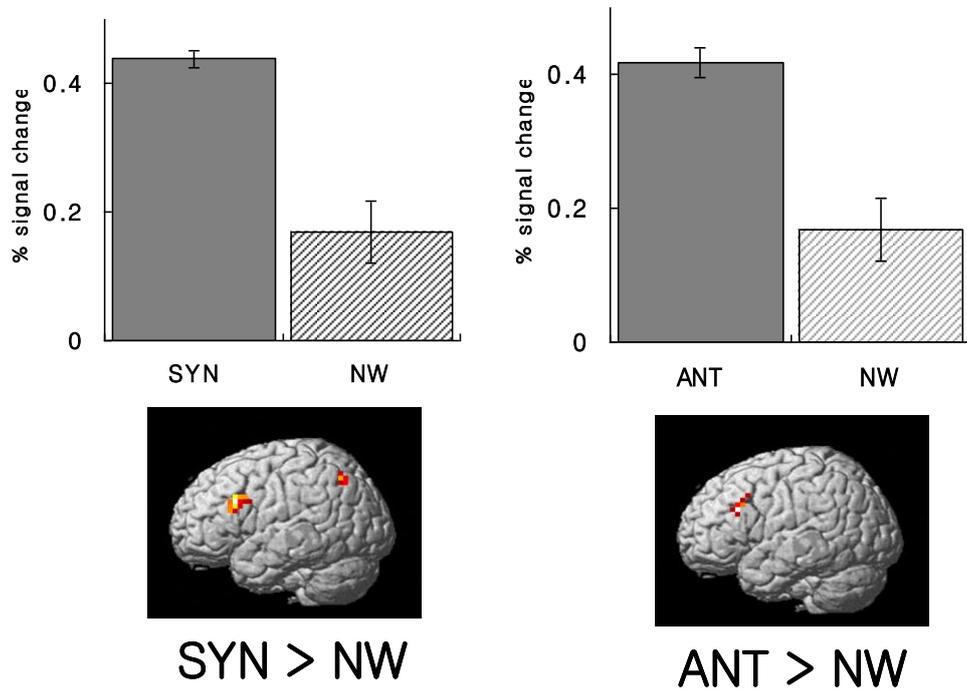

Figure 2. Top: Plot of the signal change at the local maxima of the activated areas – left middle frontal gyrus for SYN>NW (x,y,z: -40, 16, 28) and for ANT>NW (x,y,z: -52,24,28). Bottom: activations elicited by each condition when they were compared with NW conditions.

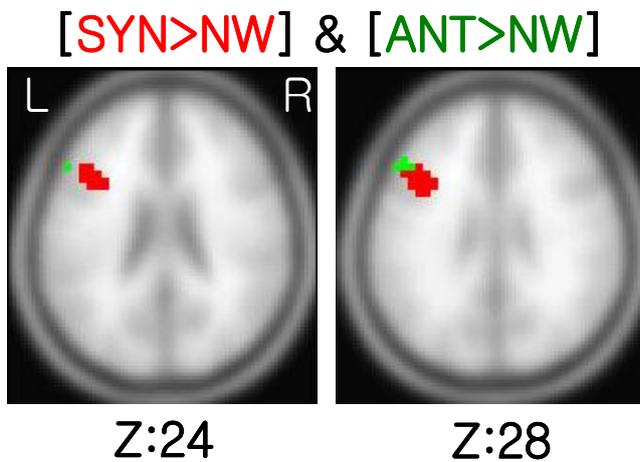

Figure 3. Within the commonly activated areas of left middle frontal gyrus from [SYN, ANT >NW], more activated regions to one specific contrast was color coded with red (synonyms) and green (antonyms). (p<.05, uncorrected)

#### **4. Discussion**

The current study intended to examine the neural systems involved in processing synonym and antonym. In brief, we demonstrated that generating synonyms and antonyms commonly activated left middle frontal gyrus, yet the exact locations of brain activity differed slightly for the two kinds of semantic word retrieval. We suggest that the common activations in the left middle frontal gyrus are involved in the mental processes of word search and selection that are shared in the SYN and ANT conditions, whereas the small and distinct activation unique to ANT condition underlies the additional component of antonym generation, namely, reversing the semantic meaning in one dimension.

The pattern of activation observed in the comparison between experimental conditions and baseline condition suggests that lexical searches are not likely to be subsumed in a single enclosed location and that several types of coding must be coordinated to perform the task. Nevertheless, nearly similar location in all of the conditions, making it likely that these areas have some computational process in common, was found in the left middle frontal gyrus. The left frontal lobe constructs strategies in accessing and searching in the storage of information, which is likely subserved by more posterior parts of the brain (Badre and Wagner, 2002). The prefrontal cortex is crucial in a number of cognitive tasks, most notably those involving executive functions and cognitive control (Lezak et al., 2004, Miller, 2000). In the previous language tasks, especially verbal fluency task selectively activated extensive regions of the prefrontal cortex, including the middle frontal gyrus (BA 6 and 9) for the process of semantic search and selection (Fiez et al, 1996; Gold and Buckner, 2002; Abrahams et al., 2003). Indefrey and Levelt reviewed imaging data that prove prefrontal gyri is specifically involved in process of word generation (Indefrey and Levelt, 2004). In our study, we provided evidence that ‘a general process of word generation’ operates across different semantic relation of synonym and antonym and is mediated by left middle frontal gyrus.

The detailed explanation of ‘the general process of word generation’ can be found in the theory of word production by Levelt and his colleagues (Levelt, 1989, 1992; Levelt et al., 1999). According to the theory, describing the processes underlying the transformation of a thought into speech, at least three types of word information are assumed to be represented: concepts, representing a word’s meaning, lemmas, representing a word’s syntactic properties, and word forms, incorporating a word’s morpho-phonological characteristics. In the current study, word generation process,

regardless of the type of semantic relation such as SYN or ANT, is mostly engaged in the early stages of Levelt's model: when paying attention to the semantic relation of the experimental condition, subjects were required to understand the concept of stimulus word, search the relevant knowledge from mental lexicon and select the most suitable target word. We suggest that the activation in the left middle frontal gyrus in our study was involved in the process of these executive functions.

The truly remarkable result in our study was that the two distinct but adjacent activations were evidently shown in the left middle frontal gyrus in generating synonyms and antonyms. In other words, even though the left middle frontal gyrus is commonly involved with word generation process in both conditions, partially specified regions were observed for each condition. The interpretation of this result can be found in the theoretical issue about the conceptual basis of synonym and antonym in lexical semantics. On the question regarding possible differences among different types of semantic relations such as synonyms and antonyms, there has been a good explanation in terms of feature composition (Fillenbaum & Rapoport, 1971). Synonyms are lexical items whose senses are similar in respect of 'central' semantic features. This does not always mean that every sense consisting of synonyms share almost identical features. They sometimes differ, but even so those features can be described as 'minor' or 'peripheral' ones (Cruse, 1986). The fact that synonyms have largely overlapping meanings can explain why two words sharing synonymous relation are easily confused with one another in recognition memory experiments and (Anisfeld, 1970; Buschke & Ronch, 1972; Goldfarb, Wirtz, & Anisfeld, 1973). In case of antonyms, as well as synonyms, they are likewise composed of similar features to one another conceptually. However, they have a critically different feature in one dimension and this opposing feature provides the core for constructing the semantic relation of antonym between two words (Kadesh et al., 1976). For example, compare the words, *big* and *small*. They, in fact, share almost identical meanings. The only, but not negligible value that brings differentiation between the two words is size dimension. Another example can be found in the relation of *fast* and *slow*. They are both features of motion but differ only in reference to plus-speed and minus-speed. *open/close* and *social/antisocial* are also good examples; the former is action verb indicating similar behavior with difference only in the direction they describe and the latter is used for describing the same dimension of personality but with opposite value (Murphy and Andrew, 1993).

In summary, both synonyms and antonyms can be generated based on different features as well as similar features, but it differs that the different features play major role in antonyms whereas minor role in synonyms. After all, the common activations in

the left middle frontal gyrus obtained from both SYN and ANT conditions are related to the mental processes of searching for and selecting the semantically related components to the stimulus word in the mental lexicon as mentioned earlier whereas the small, distinct activation was caused by the differential and critical process that reverses or opposes the semantic meaning in one dimension.

In conclusion, the present study suggests that generating synonyms and antonyms activates the left middle frontal gyrus which is involved in the common process of search and selection of a word in mental lexicon. However, adjacent but distinguished areas were independently activated between synonyms and antonyms within this area. This is well in line with the view that the organization of antonym and synonym consists of mostly similar components except for a few ones that are assigned as a major role for antonyms and minor role for synonyms. Therefore, processing the commonness between synonym and antonyms may be the main causes of frontal lobe activation whereas some features specific to antonyms may produce the small but different activation. Our results may appear difficult to explain other semantic relation of word sense such as homonymy and polysemy. Considered it to be great ability for human parser to deal with the ambiguity of natural language, the cognitive architecture of processing homonymy or polysemy should not go unheeded. Since our current experiments worked with the specific relation of synonyms and antonym, we hope that further research will extend the findings for elucidating neural mechanisms of semantic relations in general.

## **Abstract**

Using the framework of Cognitive Grammar by Langacker (1987, 1991a, 1991b, 2000), this paper deals with the flexible property of the boundary which is supposed to surround the periphery of English nouns. In particular, such boundedness property of English nouns in the right choice of an appropriate article is the primary concern of this study. In order to facilitate it, this paper proposes a new cognitive notion: Boundedness Filter (BF). BF, we suggest, is related with determining which type of boundaries and its corresponding article a given noun can be assigned in human being's brain. In the latter part of this paper, BF model is even applied to explaining the internal structure of English embedded clauses.

**Keywords:** Cognitive Grammar, Inactivated Boundary, Activated Boundary, Boundedness Filter, Embedded Clause

## **1. Introduction**

In the field of English as a Second Language (ESL) or English as a Foreign Language (EFL), it has been a hot issue among scholars whether grammar is a matter of (natural) acquisition or that of conscious learning. The problem is that things can be totally different between the two situations. The comprehensible input which Krashen (1985: 2) argued for could be possible under ESL situation where natural contexts and authentic materials are easily available: under the ESL situation, learners of English can have a lot of opportunities in which their grammatical errors could be naturally corrected by native speakers around them. But under EFL situation as in Korea, many English teachers feel that a certain amount of grammar education is needed in that the

kind of natural environment of ESL is actually hard to be realized. They think that a proper knowledge of English grammar by conscious learning may be helpful in shortening the learning time of each stage as well as increasing the moving speed to the next stage of learners' interlanguage (Felix, 1981; Ellis, 1989). That is one of the reasons why the form-focused instruction is gaining popularity again in recent English education in Korea. This paper, with those situations in mind, will account for the usage of English articles in special relation to the boundedness of English nouns because Korean learners of English normally feel it is among the most difficult areas of English grammar. This account will, we expect, provide a good solution to English grammar education in Korea, where a simple memorization of grammatical rules and patterns is more highly emphasized with no deep concern about the principles underlying them. Let us first consider the examples in (1).

- (1) a. This is *a school* which was founded by a former politician.
- b. This is *the school* which was founded by a former politician.
- c. My daughter is now at *school* studying English.

Many of the English grammar books published in Korea explain that nouns followed by modifying phrases or clauses must be preceded by the English definite article *the*. But in (1a) we see that the explanation crashes: though it is modified by a relative clause, the expression *a school* is used. What is interesting here is that the use of the definite article as in (1b) is also possible in many cases. For example, if the speaker gives information to the hearer in advance, the use of the indefinite article will sound more natural. The confusion of the English learners about the usage of the English articles becomes even worse where a noun which is normally classified as countable is used without any article, i.e. when it is used with the zero article as in (1c). Many of the English teachers in Korea faced with these seemingly disordered phenomena seem to have no choice but to ask their students to just memorize the expressions. They sometimes suggest a simple and narrowly adaptable rule: 'the English zero article is required when the noun is used for its original purpose.' Then, how can the use of the zero article in examples in (2) be explained?

- (2) a. He read the paragraph *word* by *word*.  
b. They marched along the street *shoulder* to *shoulder*.

The explanation given above for the zero article in (1c), the original purpose of the noun itself, is hard to apply to the examples (2a-b). On such deadlock occasions, many teachers tend to avoid their lack of explanatory power by saying that “They are idiomatic or fixed expressions, a reflection of culture onto language, so just memorize them.” We do not have any intention of criticizing or denying the method of memorizing idiomatic expressions in themselves. What we want to claim is that if proper rules or principles about the usage of the English articles can be captured and applied in EFL situations, the speed of learning in each stage level will greatly increase.

The purpose of this paper is, under the framework of Cognitive Grammar (CG) (Langacker 1987, 1991a, 1991b, 2000), first to analyze the meaning mechanism of the three types of the English articles, and secondly to show how they work with the concept ‘boundedness’ of English nouns. Our choice of CG as the theoretical basis of this paper relies on the fact that it will best visualize the cognition process occurring in our brain with such concepts as conceptualization, cognitive domain, symbol, image, schematic figure, semantic extension, etc. Another thing we would like to demonstrate at the end of this paper is that the boundedness of nouns related to the usage of the English articles could be extended beyond nominal expressions to the explanation of the internal meaning structure of English non-finite embedded clauses.

## **2. Boundedness and the English Indefinite Article**

Langacker (1991b: 63-74) defines a noun as having following properties.

- (3) a. A noun designates a region in some domain.  
b. A count noun designates a region that is bounded within the scope of predication in its primary domain.  
c. A mass noun designates a region that is not specifically bounded within the scope of predication in its primary domain.

Of our special interest is (3c), especially the phrase *not specifically*. He classified nouns not by the existence or non-existence of boundaries but by the characteristics or features of the boundaries. In (3a), he defines a noun as designating a region in some domain. It seems reasonable that a region which occupies a particular area in space should entail a boundary. How could a region exist without its defining boundary?

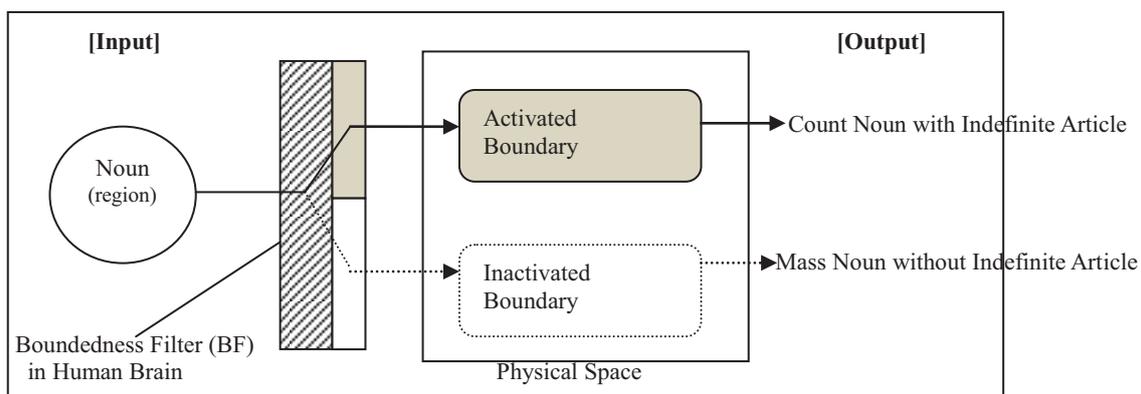

The difference between the two types of nouns in (3b-c) seems to be a question of whether the outward boundary of each noun is clearly visible or not. In (3b), the boundary is clearly visible, while it is not in (3c). This requires us to differentiate the two kinds of boundaries more precisely, and so we propose *Activated Boundary* for such a count noun as in (3b) and *Inactivated Boundary* for such a mass noun as in (3c).

Let's look at the following examples.

- (4) a. *Beer* can cause a beer belly.
- b. I will have *a beer*.
- (5) a. This house is made of *stone*.
- b. He threw *a stone* at me.

Examples in (4-5) show that the same noun is used both as a count and a mass noun. In (4a) and (5a), the boundaries for *beer* and *stone* are not visible since they have disappeared into the inner characteristics of the nouns, and thus the Inactivated Boundary is involved. In (4b) and (5b), on the other hand, the boundary is clearly visible outwardly, and so in this case the Activated Boundary is put into play. The indefinite article *a* is used here as a kind of marker for the Activated Boundary, visualizing the inner characteristic of a noun out to the physical world or space. What can be inferred from this observation is that English nouns are not granted the attribute of countness or massness intrinsically. They are given that property extrinsically depending on the given situation of speech acts. <Figure 1> illustrates the explanation thus far, where a new notion *Boundedness Filter (BF)* is introduced.

<Fig. 1> BF Model for the English Indefinite Article

Take (4b) for example. Let's assume somebody is asked what he is going to drink. The speaker *I* thinks in his mind of 'an entity of yellowish, frothy, and alcoholic liquor (the circle in <Figure 1>)' from his encyclopedic knowledge (Langacker 1987: 154-166). The emerging entity now goes through BF and is decoded about the activatedness of its boundary. The speaker wants a bottled or canned beer, not the liquid itself, that is to say, he through his BF wants the noun *beer* to be given Activated Boundary in physical space by the use of the indefinite article *a*. In (4a), on the other hand, the speaker, concerned only with the inner characteristic of the entity *beer* regardless of its outer shape, makes a possible boundary on the noun *beer* consciously inactivated to have the property of massness through his BF.

(5a-b) can be understood in the same way. The noun *stone* in (5a) has Inactivated Boundary while the noun *stone* in (5b) has Activated Boundary. Of course, all this process takes place through the BF which we claim to exist in the interlocutor's brain. To sum up, English nouns which are characterized by occupying a region can be allotted one of the two types of flexible boundaries only after going through human being's BF in the first place. It does not have its inherently fixed boundary from the beginning. Let us consider examples in (6) from Langacker (1991b: 73) to check our Activated or Inactivated Boundary applies.

- (6) a. After I ran over the cat with our car, there was *cat* all over the drive way.  
 b. I don't like *shelf* – I'd rather eat *table*.

In (6a), the cat which is scattered all over the drive way is no longer a thing cat but a material which has lost its boundedness as a common noun in physical space. In other words, the speaker through his BF renders the boundary of *cat* inactivated. In a personified dialogue situation between two termites of (6b), it's impossible for the termites to see the physical outside boundary of a shelf or a table which is much bigger than themselves. In addition, *shelf* and *table* recognized by them as food are considered to have lost their outer boundary through BF to be given the invisible Inactivated Boundary.

### 3. Psychological Boundedness and the English Definite Article

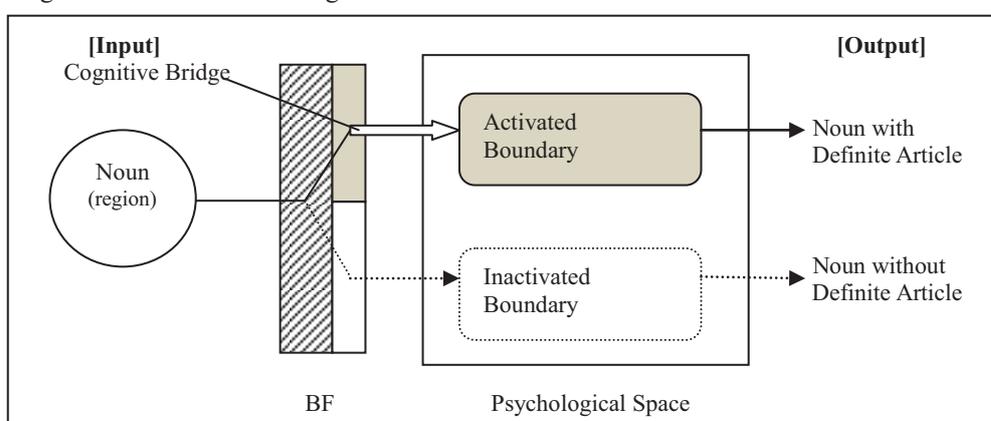

Lee (2007), with the introduction of a new notion of the 'Cognitive Bridge,' explained the predication of the English definite article *the* as follows:

- (7) The 'Cognitive Bridge' is constructed by the speaker and then is built on the hearer's cognition. Its first role is to be used as a cognitive setting in which *the* can be naturally used.

One important thing to point out about his article is that he failed to take into consideration the fact that *the* can be used not only for a count noun but also for a mass noun. But what he provided in (7) is a decisive clue that can be used to overcome the weakness of his paper. It is the concept Cognitive Bridge and especially its role as a cognitive setting. What is a cognitive setting and how can this be applied to BF Model of this paper? If we reconsider the flexible nominal boundary discussed in Section 2, we can see without great difficulty its cognitive setting is physical space. In the cognitive setting of physical space, only the boundary of a count noun can be activated while that of a mass noun cannot. Then how can the English definite article be used with a mass noun? It is because the two cases are happening in two different cognitive settings: the cognitive setting for the English definite article is not physical space but psychological space. The boundary in psychological space plays a role different from the boundary in physical space. As Lee implies in (7), it works on the cognitive setting shared between

the speaker and the hearer, i.e. the Cognitive Bridge, Therefore the role of the boundary in psychological space is to point out which entity is referred to by the two persons involved – regardless of whether it is a count noun or a mass noun. Although a mass noun cannot be activated with its boundary in physical space, it can be an entity for co-reference which is realized with the English definite article in psychological space. The basic schema of BF Model for the English indefinite article presented in <Figure 1> can also apply to the English definite article. See <Figure 2> below.

<Fig. 2> BF Model for the English Definite Article

Let us think about a certain noun (the circle in <Figure 2>). Whether it is a count noun or a mass noun, it is after all an entity which can occupy a region in psychological space. Now the noun goes through BF and has its boundary determined by being checked whether it can cross the Cognitive Bridge or not. If it can cross the Cognitive Bridge, the noun will be given the definite article, while if it cannot, the noun will not be given the definite article. Now we come to a very important finding here. BF, in determining what kind of boundary a given noun should have, can work sometimes with physical boundary and sometimes with psychological boundary. Depending on speech contexts, it can operate with various types of cognitive domains simultaneously.

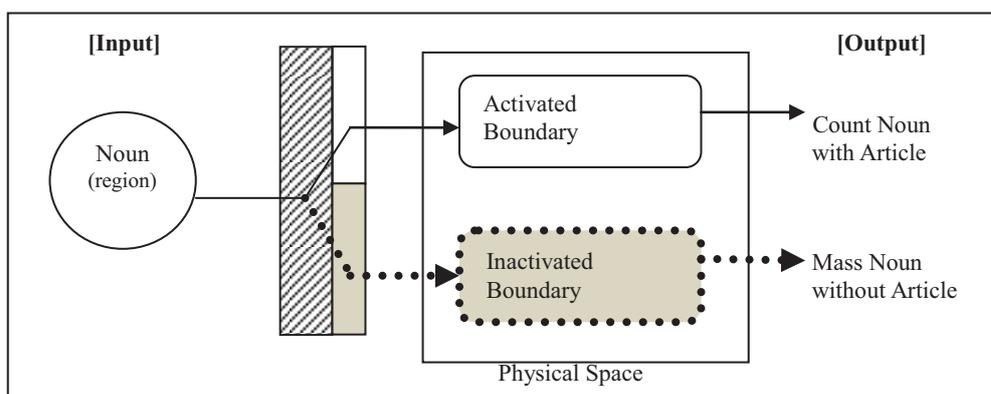

#### 4. BF and the English Zero Article

Below are the typical examples of the English zero article.

- (8) a. I usually go to *school* at 8 a.m.  
 b. We went there by *bus*.

Mere memorization of the usage of the zero article, as mentioned in Section 1, is never an active and productive process of learning. We now know, through Section 2, a noun is an entity occupying a region with a flexible boundary. Then why is it that the nouns *school* and *bus* in (8) are used without any article, even though they could be things with outward boundaries in physical space? We claim that it can be explained with <Figure 3> the BF Model for the English zero article.

<Fig. 3> BF Model for the English Zero Article

The boundary of singular nouns such as *school* and *bus* (the circle in <Figure 3>) in (8) is normally activated through BF and assigned one of two articles, indefinite or definite. But the fact that they are not given any articles indicates that they have gone through BF to be allotted Inactivated Boundary (see the heavy dotted line in <Figure 3>). What is the output on the right side? They come to take on the characteristics of a mass noun. The *school* in (8a) is not a school as a physical thing; neither is the *bus* in (8b). Their possible outer boundaries have become submerged into their inner features in order to just profile their abstract functional aspects: *school* for studying and *bus* for transportation. Therefore, we can understand the English zero article as the marker for the contextually intended Inactivated Boundary to highlight the inner characteristic or feature of a noun.

Now we can propose a solution to the question raised in the examples (1a-c). In the case of (1a), the input *school* is filtered through BF to be given Activated Boundary

but fails to cross the Cognitive Bridge, and so the output is *a school*. For (1b), the input *school* goes through BF to be given Activated Boundary and at the same time it successfully crosses the Cognitive Bridge, and so the output is *the school*. In the case of the zero article in (1c), it is the result of the speaker's deliberate inactivation of the noun's boundary for the purpose of profiling functional aspect of *school* for studying.

How can, then, the zero article in the example of (2a-b) be accounted for? Actually, we can feel the outer boundary in the two nouns *word* and *shoulder*. So it is not logical in this case to present the same reason as that used in the explanation of the nouns with the zero article in (8a-b). The thing that we should pay attention to is the use of the prepositions *by* and *to*. We believe they are playing the role of physically Activated Boundaries. So if we use the indefinite article as in *\*a word by a word* or *\*a shoulder to a shoulder*, we are faced with the problem of double boundaries. To avoid this result of unnecessary redundancy we do not use the indefinite article. But this should be differentiated from the cases in (8a-b), in which the boundary of a noun is deliberately inactivated.

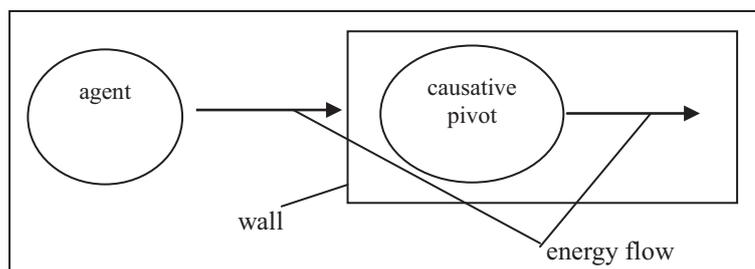

## 5. BF Model applied to English Non-finite Embedded Clauses

Kim (2006) claims that the three types of case markings (*-yi/-ka*, *-ul/-lul*, *-eykey*) of the causative pivot in Korean causative constructions reflect the difference of the causation energy from the agent or subject. He explains that the relative degree of the energy gets bigger from (9a) to (9c).

- (9) a. Sally-ka      ai-tul-iy      bakkeyse      nol-keyha-yess-ta.  
                  -NOM   child-PL-NOM   outside      play-CAUS-PAST-
- b. Sally-ka      ai-tul-eykey      bakkeyse      nol-keyha-yess-ta.  
    -DAT
- c. Sally-ka      ai-tul-lul      bakkeyse      nol-keyha-yess-ta.  
    -ACC

‘Sally made the children play outside.’

<Fig. 4> Energy Flow and Agentivity of the Causative Pivot

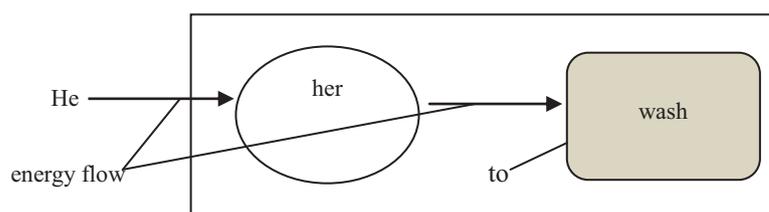

<Fig. 4> is a reorganized version of Kim (2006: 34-35)'s figures for the explanation of (9a-c). It shows the flow of energy from the agent to the causative pivot or secondary agent in the embedded clause. What especially concerns us in <Figure 4> is the existence of a wall surrounding the embedded clause. We would like to explain the difference among infinitives of the following examples in (10a-c) by applying the wall to English non-finite embedded clauses

- (10) a. He wanted → [her *to wash* the dishes].  
 b. He made → [her *wash* the dishes].  
 c. He saw → [her *wash* the dishes].

The arrow (→) in (10) indicates the influence the agent *He* has on the wall of the embedded clause. The existence of energy from the agent is evidenced by the accusative case of the embedded subject. Getting a hint from Kim (2006), we would like to explain our concern here, i.e. the meaning difference between *to*-infinitive in (10a) and bare-infinitive in (10b-c), which corresponds to the meaning difference of Korean causative constructions resulting from various case markings in (9a-c). We claim that this difference can be explained by the two types of boundaries we have proposed in this paper: Activated and Inactivated Boundary. Let us look at <Figure 5>, in which the wall in <Figure 4> is magnified.

<Fig. 5> Internal Structure of English Non-finite Embedded Clauses

The outer boundary surrounding *wash* in <Fig. 5> is indicative of *to* in (10a). This line looks very similar to the Activated Boundary of BF Model, especially the one used to show a count noun. As the indefinite article of a count noun is the evidence of the outward and individuated boundary of itself in physical space, so the *to* in <Figure 5> implies an individuated boundary of the verb *wash*. On account of this barrier-like *to* and its relative individuality, the energy from the agent *He* cannot fully reach the *wash*. In (10b), on the other hand, the non-existence/disappearance of the barrier-like *to* motivated by the causative verb *made* implies the possibility of much more energy flow from the primary agent to the embedded predicate *wash*. What does ‘the disappearance of the ‘*to*’ mean here? The disappearing *to* corresponds to the Inactivated Boundary of the zero article profiling the property of a mass noun, thereby increasing the agent’s power of looking over the two items – the secondary agent and the embedded predicate – at the same time. The perceptive verb *saw* in (10c) could be understood in the same manner. The agent *He* does not look at *her* and *wash* separately but it looks over the overlapped two images of *her* and *wash*, due to the disappearance of the barrier-like *to*. This is very much like the inactivation of a boundary in a mass noun.

## 6. Conclusion

Human beings have a tendency to group together within a boundary according as their particular needs require: culture, politics, ideology, social class, etc. The boundary which is supposed to be essential in this grouping process, however, does not seem to be permanent; it can fade away for the time being, but after a while can reinforce itself again.

With Langacker (1987, 1991a, 1991b, 2000)’s Cognitive Grammar (CG) being the theoretical basis, we have started from the supposition that such flexible property of the boundary may be reflected on human being’s language use. In particular, the boundedness of English nouns in relation to the right choice of a proper article has been the main concern of this paper. In order to facilitate this, we have proposed a new cognitive notion: Boundedness Filter (BF). BF, as a cognitive device in human being’s brain, decides whether a given noun is assigned the Activated Boundary or the

Inactivated Boundary. Depending on where the human being's cognition takes place – the physical or psychological space – the noun which has just gone through BF is appropriately given one of the three English articles. Our BF model could even be applied to explaining the internal structure of English embedded clauses of the causative and perceptive constructions in that the count/mass noun distinction could match well with the meaning difference between *to*-infinitives and bare infinitives. Finally, we expect our research to be meaningful in an ESL or EFL situation. This type of cognitive analysis will be of help to better understand the fundamental meaning mechanism of complex grammatical phenomena. And it will hopefully reduce the time needed at each stage of language learning.

## **Abstract**

This study explores the use of inhibitory control during bilingual speech production. In particular, it investigates whether or not age of acquisition and proficiency of the second language affect whether or not bilinguals will rely on inhibitory control while speaking. English language learners of Spanish participated in a picture naming task in which they switched back and forth between their languages. The results suggest that proficiency, and not L2 age of acquisition, is a decisive factor which may determine whether inhibitory control or language-specific selection mechanisms underpin bilingual speech production. This supports a notion in which L2 proficiency leads to a shift away from inhibitory control. Theoretical implications and directions for future research are discussed.

**Keywords:** bilingualism, speech production, language selection, inhibitory control.

## **1. Introduction**

How is it that upon being presented with a picture of a couch, an English monolingual knows to say ‘sofa’ or ‘couch’ when both are perfectly acceptable labels for the object? This puzzling question regarding the competition between words in the mental lexicon is of central interest to cognitive psychologists and psycholinguists. These types of studies have traditionally focused on monolinguals; however, the last decade has shown interest in speech production and lexical processing within bilingualism. For monolinguals, it is rare that one concept can refer to two or more words (e.g., couch-sofa). Indeed, most concepts only have one word to describe them. However, when considering the bilingual case, most concepts will have two words

mapped on to them (i.e., due to translation equivalents). This, then, is a difficulty with which bilinguals are constantly faced: they must resolve competition that exists between the two possible candidates *and* select the correct language for production. Because bilinguals are able to accurately speak in only one language and switch back and forth between both languages automatically, there must be cognitive mechanisms that help the bilingual mind restrict the lexicalization procedure to only one language.

In this paper, I explore issues of language control among bilinguals. Specifically, I investigate whether or not certain factors of bilingualism (second language (L2) age of acquisition, and L2 proficiency) affect the underlying cognitive mechanisms of bilingual speech production. Green's (1986, 1998) Inhibitory Control Model (ICM) holds that the activation level of the non-relevant language is reduced at the lexical level by mechanisms of suppression. Recently, it has been suggested that these underlying mechanisms may be modulated by age of acquisition and/or proficiency in the L2 (Costa 2005, Costa & Santesteban 2004).

In the sections to follow, I first discuss the ICM and studies that have supported its claims. Next, I introduce the present study and the results of the experimental procedures. Finally, I discuss the theoretical implications of these results on models of bilingual speech production.

## **2. Inhibitory Control Model**

It may not be surprising that researchers have posited that while producing speech in one language, the non-target language is suppressed or inhibited in order to allow production of the former. Green (1986, 1998) has been the biggest advocate of inhibitory processes in lexical selection. In 1986, Green proposed the ICM, a framework that explained how bilinguals control both of their languages as to prevent massive lexical intrusions from the language-not-in-use. The basic assumption of this model is that when a bilingual wants to speak in one language only, it becomes selected and any further production of the nonrelevant language is inhibited. Figure 1 is an illustration of how the ICM explains bilingual speech production of a simple picture. In this example, an English-Spanish bilingual is told to name a picture of a chair in English. Upon seeing the picture, the semantic system sends activation to many lexical nodes of English and Spanish (the target, its translation equivalent and a cohort of related words). At the lexical level, each word contains a language tag and those belonging to Spanish become inhibited. The bilingual is now able to select the word "chair" based on its activation

level and language tag.

Green (1986) hypothesizes that words in both languages must contain particular language tags or certain labels that the speaker's IC system makes use of to ensure that the relevant output is in the target language. The use of language tags is a critical part of Green's model and also has been adopted by other researchers such as Costa, Miozzo, and Caramazza (1999).

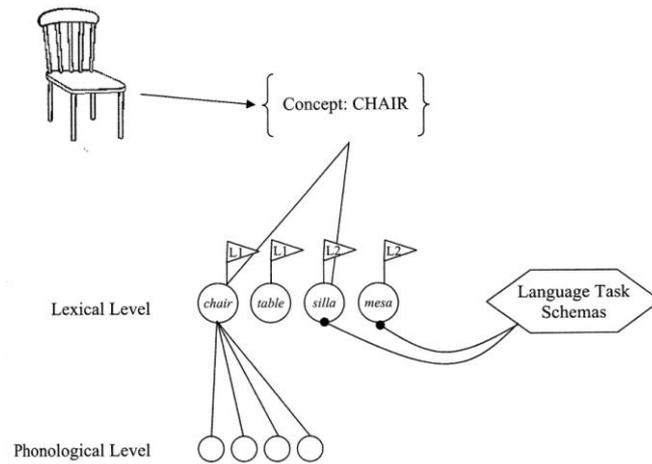

Figure 1. The Inhibitory Control Model (Green, 1986, 1998) (adapted from Finkbeiner, Gollan, & Caramazza, 2006).

The language switching paradigm has shown that bilinguals have more difficulty switching into their L1 than into their L2. This empirical finding has been said to support the ICM because more inhibition must be applied to a larger system (L1) when speaking in the L2 and therefore when a bilingual wants to switch back to the L1, it will require more time to reactivate that larger system from being suppressed than it would the L2 system. Such predictions have been supported in numeral naming tasks (Meuter 1994, Meuter & Allport 1999, Finkbeiner, Almeida, Janssen, & Caramazza 2006) and in picture naming tasks (Costa & Santesteban 2004). It must be noted, however, that although these findings have been reported in laboratory settings, mixed results in nature speech situations have been found (Grosjean 1988, 1997, Grosjean & Miller 1994, Li 1996, 1998).

In their seminal article, Meuter and Allport (1999) conducted a battery of switching experiments on "reasonably proficient" bilinguals who were presented with lists of numerals (1-9). The order of the numerals and length of the lists were randomized. Each list consisted of 5-14 numerals which were placed in either a blue or

yellow rectangle indicating that the participant was to name the numeral in his/her L1 or L2, respectively. Within each list of numerals, Meuter and Allport randomly included anywhere from 0-4 switches which could be either L1 or L2 switch trials. Their results suggest many things: 1) that switch trials are slower than nonswitch trials; 2) that nonswitch trials have faster RTs in L1; 3) that L2 switch trials have faster RTs than their L1 counterparts (which suggests that a switch to L1 is more difficult); and 4) that the RTs increase with each successive switch.

Meuter and Allport's study has provided the most influential support for the IC Model and its hypotheses have also been reported in Meuter (1994) and replicated in Costa and Santesteban (2004). The latter is one of the most important studies to date that puts both the two above theoretical frameworks within the same context. These researchers questioned if highly proficient bilinguals would act differently than low proficient bilinguals in terms of which cognitive mechanisms they would call upon during speech production. They hypothesized that IC would not be observed in lexical selection for highly proficient bilinguals but would be for those with lower proficiency in the L2. As in Meuter and Allport (1999), Costa and Santesteban operationalized IC by asymmetrical switching costs associated with L1-L2 and L2-L1 language switches.

To test the extent of the ICM in bilinguals of various proficiency levels, Costa and Santesteban conducted a series of five experiments similar to the design used in Meuter and Allport (1999). The results of their experiments suggested that inhibitory control is sensitive to L2 proficiency level and can be summed up as follows:

- (1).....Language switching costs are present in all types of bilingual speakers tested.
- (2).....Asymmetrical switching costs are present for L2 learners (those with lower proficiency levels) but not for highly proficient bilinguals.
- (3).....The switching performance of a highly proficient bilingual is independent of the difference in proficiency levels between the two languages involved in the task.
- (4).....In a language switching task, highly proficient bilinguals are slower in their dominant than in their non-dominant language both for switch and nonswitch trials.

Costa and Santesteban's (2004) study sheds new light on how psycholinguistics view bilingual speech production. Their study has posited that the control mechanisms that are called upon when bilinguals speak is relative to their L2 proficiency level. When bilinguals are less proficient in their L2, they will need to rely on inhibitory mechanisms for them to select the right word in the correct language. However, with gains in proficiency, bilinguals begin to make use of language-specific selection

mechanisms. Costa and Santesteban left open the possibility that this shift, however, could be affected by L2 age of acquisition.

### **3. Present Study**

The present study addresses the issue of whether proficiency or L2 age of acquisition is responsible for the lack of inhibitory control among highly proficient bilinguals reported in previous studies. It is hypothesized that how bilinguals select the target language of production and control intrusions from the irrelevant language will depend on their proficiency level. In accordance with Costa and Santesteban (2004), low proficient bilinguals will exhibit evidence of inhibitory control and highly proficient bilinguals will be able to rely upon language-specific selection mechanisms. Moreover, regardless of proficiency level, I predict that age of acquisition will modulate these mechanisms.

#### *3.1. Participants and experimental groups*

The subjects who participated in both experiments included 53 English native speakers who were learning Spanish as their second language. All participants were currently enrolled in at least one course conducted in the L2. These participants were recruited from a large university in the United States and ranged in age from 18-44.

Two separate statistical procedures were conducted in the present study. For the analysis of proficiency, the median proficiency score (110) determined two experimental groups of bilinguals: a high proficiency group (N=29) and a low proficiency group (N=24). For the analysis of L2 age of acquisition, the median age reported in the language history questionnaire (12) determined two experimental groups of bilinguals: early (N=28) and late (N=25).

#### *3.2. Estimating L2 age of acquisition*

A language history questionnaire was administered to gather information regarding the participants' experience with their second language. On this questionnaire, all participants listed the age at which they began learning their second language. The ranges of age of acquisition for all participants varied between < 1 and 40.

### *3.3. Measuring proficiency*

A proficiency measure was conducted to estimate L2 proficiency level based on spontaneously and rapidly generating as many words as possible related to a given semantic category in the less dominant language. A total of ten categories (e.g., animals, fruits, clothing, etc.) were taken from Gollan, Montoya, and Werner (2002) and were individually verbalized to each participant. Upon hearing the category, each participant was given 60 seconds to produce as many items within that category as s/he could. These responses were taped, transcribed, and checked for accuracy by the researcher. A total proficiency score was calculated by adding all responses from each of the ten semantic categories described above. Each word was only counted once and therefore, words that may have been repeated during the proficiency measure were not included in the participant's proficiency score. Essentially, this score represents the total number of words produced in the L2 for all ten semantic categories during a total of ten minutes.

### *3.4. Stimuli*

In accordance with Costa and Santesteban (2004), the present experiment includes ten black and white line drawings from the Snodgrass and Vanderwart (1980) picture list. The materials used for all participants were the same. As in Costa and Santesteban, all ten pictures used in the present experiment were presented individually on a computer screen and were classified as either a nonswitch trial or a switch trial. A nonswitch trial is defined as one in which the previous trial is named in the same language and a switch trial is one in which the previous trial is named in a different language.

### *3.5. Design*

A range of 5-14 pictures were randomly placed in 100 lists which contained anywhere from 0-4 switch trials. The total number of trials in the experiment was 950 (665 nonswitch trials (70%) and 285 switch trials (30%)). All of the pictures were individually presented in a colored box as a language cue: blue if the target was to be produced in English or yellow if the target was to be produced in Spanish. There was equal production of L1 and L2 (475 responses in L1 and 475 responses in L2 were elicited). Each of the pictures was presented 95 times during the experiment. For lists with 5-10 pictures in length, no pictures were duplicated. However, for lists of 11-14

pictures, the repeated pictures were placed at least three trials apart from their first presentation.

All ten pictures used in the current experiment can be found in the illustrated example of a list of 10 pictures in Figure 2. Note that due to space and color restrictions, the letters “E” and “S” appear in the trials only to represent that the pictures are to be named in English and Spanish, respectively. In the actual experiment, these language cues were in the form of a color cue as mentioned above. In Figure 2, picture (1) demonstrates to the participant that the first trial (2) will need to be named in English trial. Trials (4) and (8) represent switch trials and trial (12) demonstrates that the list has ended. Thus, this example includes a list of ten pictures with two language switches (one L1 and one L2).

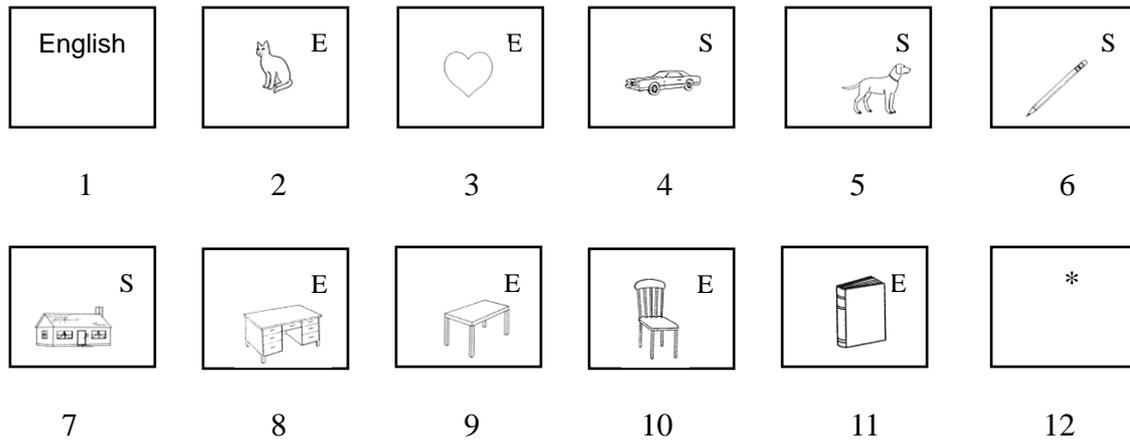

Figure 2. Experimental list example.

### 3.6. Procedure

There were six practice lists of pictures followed by 100 identically-structured experimental lists. Each list first presented either the word “English” inside a blue box or “Spanish” inside a yellow box for 2000 ms in the center of the computer screen to establish a common fixation point for all pictures. This allowed participants to be able to focus on the position and only name pictures throughout the experiment without having to look in other places of the screen for the target. The words “English” and “Spanish” also served to reinforce the association between color and language of production (i.e., blue represented English and yellow indicated Spanish). In any given

list, the first picture was presented in the same box as the fixation box. This picture remained on the screen for 2000 ms or until the participant responded. The next picture (either a switch or nonswitch trial) was shown and the cycle was repeated until the end of the list, at which time an asterisk (\*) was presented for 1000 ms to show that the list had finished and that another one would begin in 1000 ms.

### 3.7. Data analyses

Only correct responses were included in the reaction time analyses; correct and incorrect responses were both included in the accuracy analyses. Accuracy was coded by the researcher as either correct (if the participant correctly named the target) or incorrect (if the participant incorrectly named the target or if there was a technical malfunction). Two ANOVAs were conducted to investigate the effects of L2 age of acquisition and L2 proficiency on inhibitory control.

## 4. Effects of L2 Age of Acquisition

Mean scores across the four contexts were computed for each participant. An ANOVA was conducted using participant means as random factors with age of acquisition (early or late) as the between-group factor and response language (L1 or L2) and trial type (nonswitch or switch) as within-group factors.

The descriptive statistics for reaction time, accuracy, and the switching costs associated for L1 and L2 switches for the two groups tested appear in Table 1.

Table 1

*Error Rate (in %) and Reaction Time (RT) and Switching costs (in ms) for Early and Late Age of Acquisition*

	<u>Early Age of Acquisition</u>				<u>Late Age of Acquisition</u>			
	<u>L1</u>		<u>L2</u>		<u>L1</u>		<u>L2</u>	
	RT	Acc	RT	Acc	RT	Acc	RT	Acc
Switch	1013	94.4	931	96.8	957	94.1	887	96.4
Nonswitch	935	96.3	877	98.0	882	96.4	832	97.8
Switching cost	78		54		75		55	

#### 4.1. Response latencies

At first glance, the data shown in Table 1 demonstrate similar switching costs associated for those with early and late age of acquisition. In fact, the ANOVA revealed a main effect for response language,  $F(1, 52) = 39.62$ ,  $MSE = 230507.76$ ,  $p < .0001$ . This suggests that it took more time for participants to name pictures in the L1 than in the L2 (947 ms and 881 ms, respectively). In this analysis, as in the previous ones, picture naming was faster in the L2 (in accordance with previous findings). There was also a main effect reported for trial type,  $F(1, 52) = 88.37$ ,  $MSE = 232257.03$ ,  $p < .0001$ . This indicates that participants were slower at naming pictures in switch trials (947 ms) than in nonswitch trials (881 ms).

There was one interaction from these analyses that is essential to discuss. As expected, there was a significant interaction for response language and trial type,  $F(1, 52) = 6.20$ ,  $MSE = 6181.59$ ,  $p < .05$ . This interaction is important because it indicates that the magnitude of the switching costs is different for L1 and L2 switches. It is very important to note that this interaction, however, was not dependent upon whether the participants were exposed to their less dominant language early or late in life. Thus, unlike the results from the proficiency analyses, the three-way interaction for response language, trial type, and age of acquisition was not significant,  $F(1, 52) = .09$ ,  $MSE = 89.32$ ,  $p = .77$ . In other words, bilinguals, regardless of the age at which they began learning their L2, suffer similar asymmetrical switching costs and thus utilize IC to help them select the target word for production.

#### 4.2. Error analyses

In the analysis of accuracy, there were two main effects. First, there was a reported main effect for response language,  $F(1, 52) = 25.68$ ,  $MSE = .019$ ,  $p < .0001$ . This suggests that participants were more accurate naming pictures in a particular language. Mean error percents showed that naming in L1 (95.3%) was less accurate than in L2 (97.2%). Second, there was an observed main effect for trial type,  $F(1, 52) = 39.99$ ,  $MSE = .015$ ,  $p < .0001$ . This finding indicates that participants were more accurate in nonswitch trials (97.1%) than in switch trials (95.4%). The ANOVA revealed no significant interactions.

### 5. Effects of L2 Proficiency

Mean scores across the four contexts were computed for each participant. An ANOVA was conducted using participant means as random factors with proficiency (low or high) as the between-group factor and response language (English or Spanish) and trial type (nonswitch or switch) as within-group factors.

The descriptive statistics for reaction time, accuracy, and switching costs associated for switching between languages for the two proficiency groups tested appear in Table 2.

Table 2

*Error Rate (in %) and Reaction Time (RT) and Switching costs (in ms) for Low and High Proficiency*

	<u>Low Proficiency</u>				<u>High Proficiency</u>			
	<u>L1</u>		<u>L2</u>		<u>L1</u>		<u>L2</u>	
	RT	Acc	RT	Acc	RT	Acc	RT	Acc
Switch	1006	93.9	917	96.9	974	94.7	908	96.3
Nonswitch	913	96.6	867	98.3	913	96.1	849	97.5
Switching cost	93		50		61		59	

### 5.1. Response latencies

Table 2 shows that the magnitude of the switching costs for both languages is similar for the high proficiency group (L1: 61 ms; L2: 59 ms) but the opposite is observed for those with lower proficiency (L1: 93 ms; L2: 50 ms). In other words, low proficient bilinguals need more time to switch into their more dominant language.

The ANOVA revealed a main effect for response language,  $F(1, 52) = 39.62$ ,  $MSE = 230507.76$ ,  $p < .0001$ . This suggests that naming pictures in one particular language was slower than the other (L1: 947 ms; L2: 881 ms). In this analysis, as in the previous ones reported in this dissertation, picture naming was faster in the L2 (in accordance with previous findings). There was also a main effect reported for trial type,  $F(1, 52) = 88.37$ ,  $MSE = 232257.03$ ,  $p < .0001$ . This indicates that participants were slower at naming pictures on switch trials (947 ms) than on nonswitch trials (881 ms).

Logically, there were two interactions that are important to the response latencies analyses. First of all, there was a significant interaction for response language and trial

type,  $F(1, 52) = 6.20$ ,  $MSE = 6181.59$ ,  $p = .016$ . This interaction is important because it suggests that the magnitude of the switching costs is different for L1 and L2 switches.

A very important three-way interaction emerged from the speech production of low and high proficiency groups for response language, trial type, and proficiency,  $F(1, 52) = 5.29$ ,  $MSE = 5271.24$ ,  $p = .025$ . Unlike the analyses for bilingual type that suggested that the overall data were similar for all bilinguals, this three-way interaction indicates that not only are there asymmetrical switching costs for L1 and L2 switch trials, but that the magnitude of the switching costs are dependent upon the participants' L2 proficiency. As shown in Table 2, the difference between L1 and L2 switch trials was 43 ms for those with low proficiency and was only 2 ms for those with high proficiency. Figure 3 illustrates that participants with low proficiency take more of a "hit" when switching to their more dominant language than those with high proficiency.

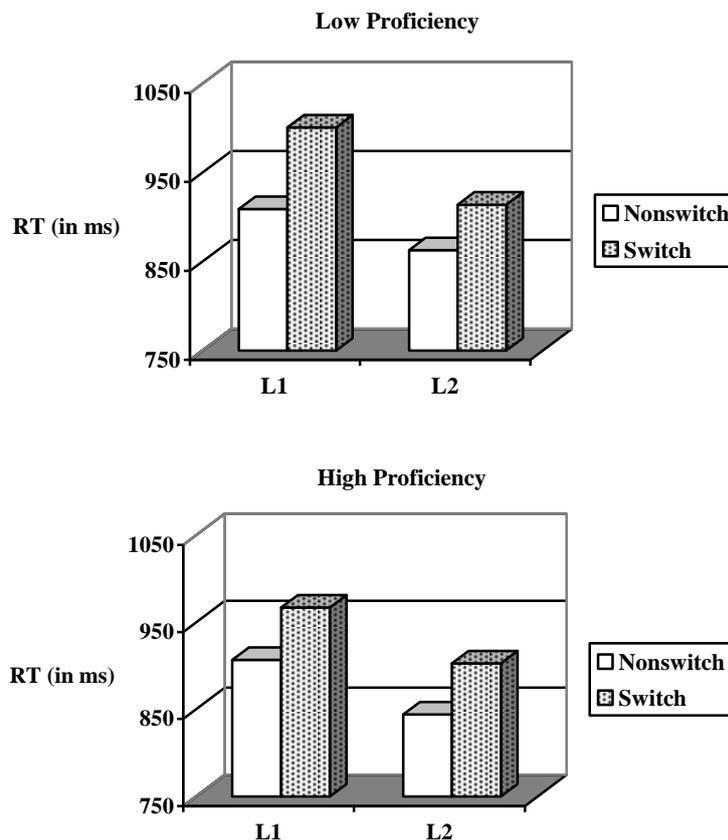

Figure 3. Differences in switching costs by proficiency.

## 5.2. Error analyses

In the analysis of accuracy, there were two main effects. First, there was a reported main effect for response language,  $F(1, 52) = 25.68$ ,  $MSE = .019$ ,  $p < .0001$ . This suggests that participants were more accurate naming pictures in a particular language. Mean error percents showed that overall picture naming in L1 (95.3%) was less accurate than in L2 (97.2%). Second, there was an observed main effect for trial type,  $F(1, 52) = 39.99$ ,  $MSE = .015$ ,  $p < .0001$ . This finding indicates that participants were most accurate in nonswitch trials. Indeed, mean error percents showed that naming pictures at nonswitch trials (97.1%) led to fewer errors than at switch trials (95.4%)

## 6. Discussion

The statistical analyses conducted revealed several interesting results. Recall that Costa and Santesteban (2004) have suggested that during development in a second language, bilinguals move away from using IC in their speech production. They attributed this to either L2 proficiency or the age at which the L2 was acquired. The present study investigated whether or not these two factors affected the reliance on inhibitory control in the speech production of bilinguals. The L2 age of acquisition analyses revealed no significant effects on inhibitory control. This is to say that overall, participants with early and late ages of acquisition performed similarly. The proficiency analyses in the present study, however, painted a very different picture. Indeed, bilinguals with low proficiency in their less dominant language need to inhibit one language for production of the other. However, as also revealed in Costa and Santesteban (2004), the high proficiency group in the current study did not show evidence supporting the claims put forth by the IC Model. Overall, the analyses that explored the effects of L2 proficiency on inhibitory control have supported Costa and Santesteban's claim that with increases in proficiency in the L2, there is a shift away from inhibitory control to reliance on language-specific selection mechanisms.

The results of the present study align well with Schwieter and Sunderman's (submitted) Selection by Proficiency (SbP) Model. As can be seen in Figure 4, this model of bilingual speech production entertains the notion that inhibitory control is modulated by L2 proficiency. According to these researchers, in this model, bilinguals move along a proficiency continuum in a bi-directional manner. Figure 4 illustrates that with second language use and practice—which in turn leads to increased proficiency—bilinguals acquire the ability to achieve language selectivity and therefore, can rely on language-specific selection mechanisms at the conceptual level. Until they can achieve

this, they will be forced to rely on inhibitory control to suppress any non-target language words that may be activated at the lexical level.

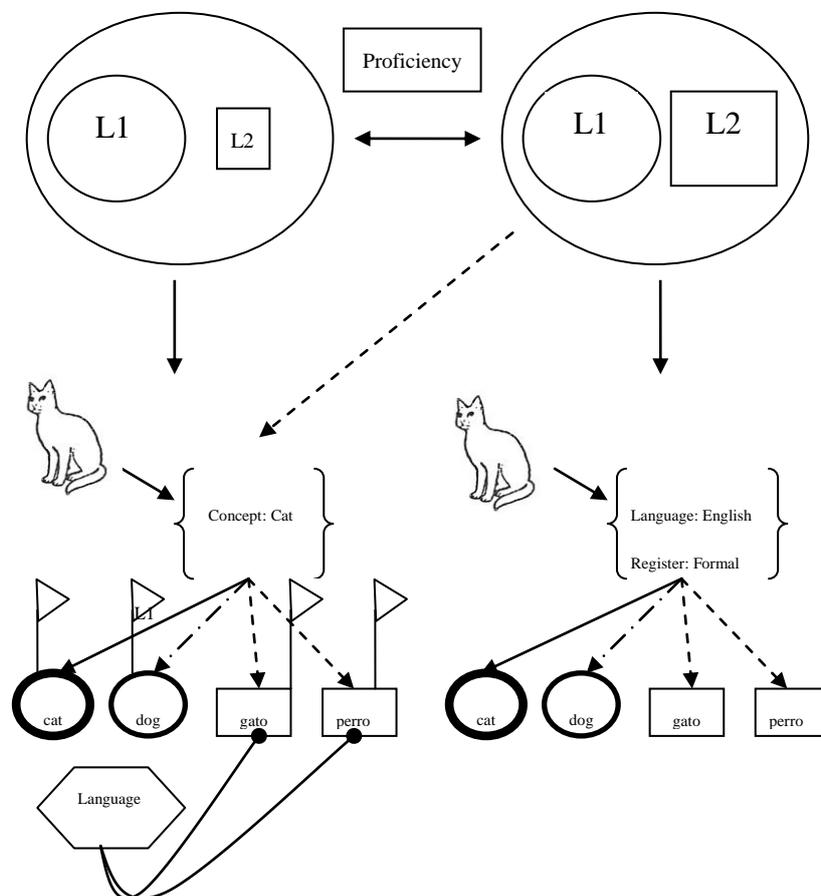

Figure 4. The Selection by Proficiency Model (Schwieter & Sunderman, 2008; submitted)

Schwieter and Sunderman's (submitted) SbP Model is a visualization of lexicalization in bilingual speech production for a less proficient and more proficient bilingual. The model suggests that when a less proficient bilingual is asked to name a picture of cat in his second language, several lexical candidates in both languages receive activation. The words in the non-target language become suppressed so that it is easy for the bilingual to decide which word in the target language matches the target concept. The SbP Model argues that this procedure is very distinct for a highly proficient bilingual. The latter has acquired a skill that allows him/her to specify the target language from the beginning stages of speech production. When a highly proficient English-Spanish bilingual is asked to name a picture of a cat in Spanish, several lexical candidates in both languages receive activation from a preverbal message

which contains vital higher linguistic information about speech production including but not limited to: 1) the target language; 2) the linguistic register; and 3) the concept to be lexicalized. These cues work together to ensure that the target lexical item has a higher activation level than its competitors. Under this assumption, there is no need for inhibitory control.

## **7. Conclusion**

The present study examined the extent of inhibitory control during bilingual speech production. In particular, it explored the effects that certain factors of bilingualism (L2 age of acquisition and proficiency) have on determining whether or not these control mechanisms will be relied on (versus reliance on language-specific selection mechanisms). The statistical procedures revealed no effect for age of acquisition. This suggests that learning a second language early or late in life does not appear to impact the control mechanisms that are required to restrict the lexicalization procedure to one language during bilingual speech production. This was not the same, however, when analyses were conducted to explore the effects of proficiency. The results of these analyses revealed striking patterns which were in accordance with Costa and Santesteban's (2004) hypothesis: it was suggested that reliance on inhibitory control is essentially a continuum on which bilinguals move from processes involving inhibitory control to rely on language-specific selection mechanisms. Essentially, then, this suggests that with increases in L2 proficiency, bilinguals may acquire a skill that allows them to establish the language of production and resolve competition at the conceptual level. Until this skill has been acquired, (i.e., at low proficiencies) the language of production is established at the lexical level where competition between languages is also resolved.

The results of the present study articulate the marked differences in the cognitive mechanisms that underpin bilingual speech production as explained by the SbP Model. Future studies need to address what particular elements of proficiency (i.e., lexical robustness, ability to conceptualize in the L2, etc.) lead to the reliance on language-specific selection mechanisms and avoid having to suppress the irrelevant language. Future studies also need to address the possibility that is demonstrated in the SbP Model: highly proficient bilinguals may revert back to inhibitory control. If this is the case, what contexts or factors dictate such a regression?

# On the Temporality of Human Language

Ning Chunyan

Institute of Linguistics  
Tianjin Normal University, Tianjin, China 300387  
[cyncyus@yahoo.com](mailto:cyncyus@yahoo.com)

## Abstract

The present study attempts to argue for another unique trait of human language and cognition, that is temporality, in addition to those generally alleged ones such as recursion, infinity, discreteness, and dislocation. The operation of Merge developed in Chomsky's (2000,2004) Minimalist Program for of all biological systems including the Faculty of Language and cognition in general can be further captured in terms of the temporality. The Merge employed in the mental world including human language and cognition is different from the merge in the physical world in that the former is a temporal one while the latter is a spatial one. What holds linguistic constructs as well as other cognitive constructs together are relations temporally sequenced as seen in the visual persistence in motion picture perception. The study also finds that for a given linguistic expression the logical thinking order may be reversed to the temporality of the utterances.

**Keywords:** Temporality, Physical Merge, Mental Merge, Spatial Relation, Temporal Relation .

## 1. Introduction

Recursion, infinity, dislocation, discreteness, and morphological inflection are the unique properties of human language. Of all the properties, recursion has been theoretically and empirically claimed or proven to be the most essential one in human language, distinguishing the cognitive difference between humans and other animals (Fitch & Hauser, 2004). However, in addition to this recursive property, there is another essential property of human language that has been overlooked. i.e. temporality of human cognition and language. In Chomsky (2000, 2004, 2006), Merge was claimed to be a property shared among biological systems and the “last straw” in the course of evolution from non-language to language as the result of mutation. The present study

atoms and the electrons are all physical entities, but the relations of gravity and magnetism are not entities on their own but a relation between two entities on two spaces at the same point of time. At a cross road, a passing train at 5:30 cannot form a clashing relation with a passing car at 5:31. Relations in physical world are epi-phenomenon and only real in the sense that the two objects involved are available in two different spaces but at the same point of time.

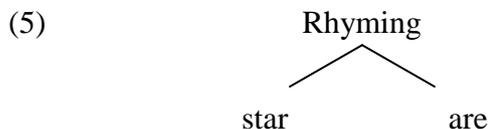

### 3. Mental Merge

Now, let us see what merge is like in the mental world. We may first recall the familiar cognitive activity of rhyming as we feel between *star* and *are* in “twinkle, twinkle, little star; how I wonder what you are”. When we line them up in a time axis, we may have the representation in (4), where  $T_x$  stands for different point of time:

(4) twinkle twinkle little *star* how I wonder what you *are*

$T_1$  ..... $T_2$ ..... $T_3$ .....  $T_4$ ... $T_5$ ....  $T_6$ --  $T_7$ .....  $T_8$ --- $T_9$ .... $T_{10}$ ...

Given the acoustic (neurological) property of words in human language, in this representation there are ten acoustic events, each having an onset time and an ending point, temporally allocated along the time axis. The mental consciousness of rhyming takes place between the vowel in the acoustic event of *star* and the vowel of the acoustic event of *are*, and the consciousness is one of a temporal (rather than spatial) relation between two sequenced physical events, for which we cannot find anything as real as anything on this time axis. Suppose we are to develop a merging rule for the rhyming between *star* and *are*, it may look like the following:

In (5), the occurrence of *star* temporally proceeds the occurrence of *are*. The neurological event for *start* was already completed at the onset time of the acoustic (neurological) event of *are*. The consciousness of rhyming is about the vowel identify of [ā], and it takes place up to the point when *are* is perceived. This mental merge as shown in rhyming is substantially different from the physical merge in (2), the former being temporal (or diachronic) whereas the latter spatial (or synchronic). But they both hold a relation: temporal relation for tem-

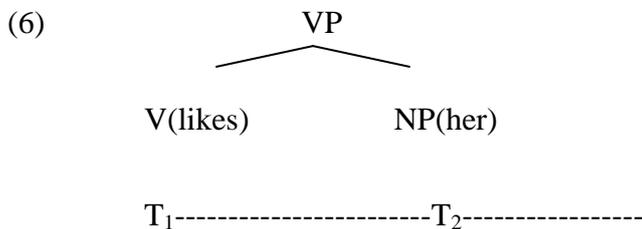

poral merge; spatial relation for spatial merge. The rhyming described above is reminiscent of our senses of motion in visual persistence.

Motion is not real by itself, but only real at the time when we conceptualize the relations among two visual images in a sequence of 26 real static pictures per a second. Motion is just a relation holding between two temporal adjacent visual images in a temporal sequence.

In summary, mental merge is like physical merge in that in both cases the two elements involved in one instance of merge contain a relation between the merged elements but unlike physical merge in that it combines two temporally discrete physical entities or events (or entities in action) whereas physical merge combines two spatially discrete objects.

#### 4. Syntactic Merge

As a formal representation, the syntactic merge Chomsky proposed for human language is no different from the general merge in (1). What a syntactic merge does is the merging of two lexical items instead of two physical objects.

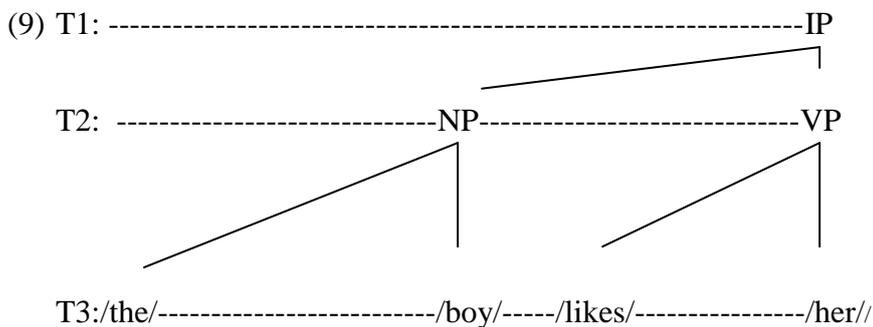

The elements involved in this syntactic merge are two sets of features: *likes* represents the set of features including *likes*; V; Singular, Present-Tense; two-place Predicate; lexical meaning....}; *her* represents the set of features including *her*; accusative Case; N; argument, lexical meaning...}. At the physical (acoustic and neurological) level, we perceive two acoustic events: /laiks/ during the time span from its onset to its end, and *her* during the time span from its onset to its end, including the acoustic marker for singularity and present-tense, the morphological verb category on the verb /laiks/ and the acoustic shape for accusative case, the pronominal category on the pronoun *her*. These acoustic or neurological events are physical by nature, just like the two physical entities in (1) and the two vowel sounds in (2). The rest including what the label VP stands for and the lexical meanings are all artifacts perceived by the Faculty of Language. They are nothing but relations: the relation between *likes* and *her*, which is

expressed as argument-grid in linguistic terms just like the electro-magnetism relation between H and O is expressed at the level of molecule as the HO in physics, and the perception of vowel identity between *star* and *are* as rhyming in phonetics. Thus, language is a kind of feeling, and meaning is the feeling of a relation between two neurological events. Then the question is where and when we encounter the VP in (6)? There are two logical possibilities: one is to align two time axes as shown in (7), and the other is to allocate everything along just one time axis as shown in (8):

- (7) T1: -----VP  
 T2: likes-----her
- (8) likes -----her-----VP

(7) might mean that one neural population is working along time axis T2 processing the sounds of likes and her in sequence and another neural population is working along time axis T2 until it conceptualizes a VP as the result of the merging of *likes* and *her* at T1. This is the familiar parallel processing. Thus, there will be as many time axes and corresponding working neural populations as the number of merging as exemplified in (9):

As a possible neural realization of this formal representation, we expect that there are three neural populations working at three different time axes. When *boy* is uttered after *the* at T3, an NP is formed at T2, and when *her* is uttered after *likes* at T3, VP is formed at T2 following NP, and at the same time at T3, the sentence (IP) is formed.

When (9) is arranged on just one time axis, we have (10):

- (10) [[[The boy] NP [likes her ] VP ] IP
- | | | | | | |
- T<sub>1</sub>-----T<sub>2</sub>-----T<sub>3</sub>-----T<sub>4</sub>-----T<sub>5</sub>-----6-----T<sub>7</sub>

Notice that there is a time interval for the syntactic constructs NP, VP and IP, and these syntactic constructs do play an indispensable role in processing the sentence, and must be attributable to the working mechanism of the human brain.

This process is very much like the visual persistence of the motion perceived in a sequence of static pictures:

(11)            motion1   motion2   motion3   motion4

Again, we see the NP in (9) is the merging result containing two temporal acoustic events and a relation holding between them just as motion1 is the result of the temporal merging of Pic1 and Pic2 with a relation holding between them. NP, VP, motions are not real by themselves.

The relation holding an atom and an electron is called electron-magnetism in physics, the relation holding the sun and the earth together is called gravity, and the relation holding *the* and *boy* to maintain an NP structure is called Spec-head relation in English, the relation holding *likes* and *her* together and that holding NP and VP is called theta-grid.

There are generally two types of relations in language: substantive relation and formal relation, and they are not real by themselves and temporal and binary by nature, i.e. a relation holding between two physical events on one time axis. The temporal relations in (10) belong to the first category. The agreement features of [Singular, 3<sup>rd</sup> Person] on *John* and those on *likes* in (11) is an example of the category of formal relations in language:

(12)    John<sub>[Singular, 3rd Peron]</sub> likes<sub>[Singular, 3rd Person]</sub> her.  
           T<sub>1</sub>-----T<sub>2</sub>-----T<sub>3</sub>----

The perception of the agreement features on *John* temporally precedes the perception of those on *likes*. Like we feel a motion between Pic 1 to Pic 2 in visual perception, and we feel the rhyming between two vowels, and we feel a semantic relation between *likes* and *her*, we feel an agreement relation between *John* and *likes*.

What about lexical meaning? Generally speaking, there are two different approaches to meanings. One is the externalistic approach represented in Fregean Semantics, which defines the meaning of a word in terms of a public reference to the object external to the human mind/brain. The other is the internalistic approach represented in Chomsky, which claims meaning is inside the head of an individual. But as for how meaning is individualized and internalized in one's head has not been scrutinized in Chomsky.

For a possible answer to this question, we refer to Edelman's (1999:20-27,46) theory of vision. In Edelman (1999), the object in vision is set of features or

predicates, which means we identify an object by evaluating the set of its attributes or predicates, following what Watanabe called the Theorem of Ugly Duckling. We may assume that there are no arguments (nouns) free from predicates (verbs and adjectives), and there are no predicates free from arguments. The relations holding between arguments and predicates together are temporal and binary as in other cognitive domains such as the visual perception of picture motions and rhyming, and can be formally expressed in terms of “mutual inclusion” as suggested in Ning (2002-a, 2002-b) as stated in the following:

- (13)  $\alpha$  and  $\beta$  can merge iff  $\alpha$  is a member of set  $\beta$  and  $\beta$  is a member of set  $\alpha$ .

The intuitive idea of this formula is that (a) an argument lexical item like *dog* is a set of properties that can be expressed in predicate verbs or adjectives such as *run*, *bite*, *hairy*, *black*, etc. , and *run* is a property shared by a set of minimal expressions such as *dog*, *tiger*, *John*, etc.. Given that *dog* is a member of the set RUN {*dog*, *tiger*, *John*,.....} and *run* is a member of the set DOG {*run*, *bite*, *hairy*, *black*,...}, there is a mutual inclusion relation holding between them, and they can merge together. This simply means that *dog* is not a word until *run*, *bite*, *hairy*, *black* are available as its correlates and *run* is not a word until *dog*, *tiger*, *John* are available to associate with it. Lexical items do not exist in isolation but in certain relation with others. Relations are not as real as its correlates and are perceivable like the motion between two static pictures presented along the same time axis and the rhyming between two acoustic events along the same time course.

The meanings (substantial and grammatical) in language are diachronic relations. In doing so, we not only capture the difference between biological systems and non-biological systems but also suggest a clue for the evolution from other biological systems to human cognition including human language: the emergence of human language may be a “great leap” from the non-symbolic physical events. The temporal merge between two symbolic physical events marks the beginning of the human language as the result of mutation in an individual. Certainly, we know little about how a temporal merge is realized in physiological, neurological terms, even less about how it is attributed to genetics.

## 5. Anti-temporality: the ordering of thinking and linguistic utterance

Linguistic expressions are uttered in a temporal sequence but thinking seems to suggest otherwise. Let us consider the processing of the following sentence.

(12) Does the young middle school master live in Boston area.

T1-----T2-----

If the sentence is in the modality of production, at the level of phonetic representation, the sequential ordering is that the word *does* with the grammatical feature of Singular/Third Person occurs at T1, but the word *master* with grammatical features of Singular/Third Person at T2, maybe one minute later than T1.

However, the logical thinking order is that the consciousness of the grammatical feature on the word *master* should be available ahead of that on *does*, given the decision making in using *does* rather than *do* depends on the previous presence of *master*, which means the speaker must know the Singularity/Third Person of *master* before he decided to use *does*. Then this mental order of thinking or the mental establishment of the agreement relation shows a temporal sequence reversed to (12), as shown in (13):

(13) the young middle school master ..does .....

T1-----T2-----

When we put the temporal sequence of the physical events in (12) and temporal sequence of the mental events in (13), we will witness a mysterious event:

(12) Does the young middle school master live in Boston area.

T1-----T2-----

(13) the young middle school master does .....

T1-----T2-----

This would suggest that we cannot synchronize the physical events and the mental events together. It seems that we do not speak while thinking nor think while speaking. The only alternative possibility is that we think before speaking.

If this is the case, we should naturally expect before the utterance of (12), (13) takes place as shown below:

(14) [*the young middle school mater does*] [does the young middle school master live in Boston area.]

Then the question is what are those in italic inside the bracket are? Certainly, they are not the words in the second bracket. Maybe they are pure concepts, i.e. concepts without phonetic forms. But the concepts about the formal agreement

between the subject *school master* and the verb *does* can not be shaped before their physical realization takes place. More examples showing this mystery are given below:

(15) In *his* works on the biological foundation of language, *Lenneberg* proposes...

T1- T2-----T3-----

The physical presentation order is *his* appears before *Lenneberg*, but the mental thinking order, if any, should be that *Lenneberg* appears before *his* since we can not decide to use *his* rather than *her* before *Lenneberg* is processed in our mind.

Consider the following Russian case of grammatical agreement:

(16) *nasha*                      *luojina* (Russian)  
       Our                         motherland  
       (singular, feminine) (singular, famine)

Again, the formal features of singularity and famine on the adjective physically appears before those on the head noun, but the mental order should be just the opposite. The concept of motherland in Russian must appear before the adjective. What is presented below is an example showing the semantic selection between a classifier and the noun it is associated with.

(17) *yi pi ma* (Chinese)  
       One CL horse

In this NP in Mandarin Chinese, the classifier *pi* physically appears before the head noun *ma* (horse), but the choice of the classifier *pi* should be made upon a previously available noun like *ma* (horse) rather than *niu* (ox), *laohu* (tiger), which require different classifiers.

All the examples show cited above indicate that the thinking order may be the reversed temporal sequencing of their corresponding utterances. Suppose we account for this mystery in terms of the familiar parallel processing, that is to say, for a given linguistic expression, thinking takes place in one neuro-population along one time axis while uttering takes place in another neuro-population along another time axis in a parallel fashion. This leads to an even tougher problem rather any solutions: Does bare thinking make any sense? How linguistic thinking is possible without linguistic expressions? Does bare linguistic expression make sense? How linguistic expressions are possible void of meaning?

## Abstract

The present paper is part of a large research programme investigating the nature and properties of the predicate logic inherent in natural language. The general hypothesis is that natural speakers start off with a basic-natural logic, based on natural cognitive functions, including the basic-natural way of dealing with plural objects. As culture spreads, functional pressure leads to greater generalization and mathematical correctness, yielding ever more refined systems until the apogee of standard modern predicate logic. Four systems of predicate calculus are considered: Basic-Natural Predicate Calculus (BNPC), Aristotelian-Abelardian Predicate Calculus (AAPC), Aristotelian-Boethian Predicate Calculus (ABPC), also known as the classic Square of Opposition, and Standard Modern Predicate Calculus (SMPC). (ABPC is logically faulty owing to its Undue Existential Import (UEI), but that fault is repaired by the addition of a presuppositional component to the logic.) All four systems are checked against seven natural logical intuitions. It appears that BNPC scores best (five out of seven), followed by ABPC (three out of seven). AAPC and SMPC finish ex aequo with two out of seven.

## 1. The programme

This tentative and exploratory paper is about a topic that has not been broached in the literature so far: the empirical adequacy of a logical system of predicate calculus. By this is meant the question of how well a logical system corresponds with natural speakers' intuitions about logical relations between and truth conditions for (propositions in) sentences. This is the methodological rationale of the research programme:

- Progress in science is contingent upon taking the data seriously.
- In the cognitive sciences, the data is experiential intuitions. In the semantics of natural language, data consists of logico-semantic experiential intuitions.
- It has been known for the last one hundred years, but one may also say for the last two thousand years, that accepted logical systems violate natural intuitions.
- This fact has not been taken seriously by logicians, whose perspective has always been metaphysical and/or mathematical, and not cognitively empirical.
- Pragmatics has served as palliative therapy.
- To understand the semantics of natural language it is necessary to investigate the possibility of reconstructing NATURAL HUMAN LOGIC.

## 2. What is logic? What is natural logic?

Logic is the formal study of consistency within a text (where "consistency" is taken in the sense of possible simultaneous truth). Therefore, logic is essential in the study of semantics: when we convey information, tell a story, issue an order or ask a question, we need to be consistent. Logic is *formal* by definition—that is, any logic is a calculus which, when followed, guarantees consistency. For most forms of consistency, however, no calculus is available. Thus, we know that (1a) is inconsistent with (1b), but there is no logical calculus that proves it:<sup>1</sup>

- (1) a. John speaks French.
- b. John died two years ago.

By contrast, (2a) is also inconsistent with (2b), but now we have a logic to prove it, as predicate logic tells us that (2b) entails the existence of at least one speaker of French, while (2a) blocks any such entailment:

- (2) a. Nobody speaks French.
- b. Some speakers of French live in London.

For natural intuition, the following two are also inconsistent:

- (3) a. Nobody speaks French.
- b. All speakers of French live in London.

But in standard modern predicate calculus (SMPC) (3a) and (3b) are taken to be consistent, because, in this logic, (3b) counts as true when there are no speakers of French.

The general hypothesis is that natural speakers start off with a basic-natural logic, based on natural cognitive functions, including the basic-natural way of dealing with plural objects. As culture spreads, stricter thinking, resulting from functional pressure, leads to better generalization and greater mathematical correctness, yielding ever more refined systems until the apogee of standard modern predicate logic. Individuals and societies are thus taken to be able to 'bootstrap' themselves up to higher levels of intellectual achievement.<sup>2</sup>

The Gricean maxims are meant to prevent this and similar clashes between intuitions and "official" logic, but their explanatory power turns out to be insufficient. Consider, for example, the following two sentences:

- (4)a. John could't go forward or backward.
- b. John could't go forward and backward.

---

<sup>1</sup> One might think of a formal machinery computing entailments from lexical meanings—an implementation of the programme of "meaning postulates" as proposed in Carnap (1956). But no such machinery has as yet been made available. Even then, however, as argued in Seuren (in press, section 2.3.1), there still is the question of the overarching general logic to which the machinery of meaning postulates is subservient.

<sup>2</sup> See Seuren 2006, in press Chapter 3. Similar processes have been observed for numeracy, reading and geometrical competence (Dehaene 1997, Dehaene 2005; Dehaene et al. 2006; Pica et al. 2004).

Sentence (4a) is immediately understood as ‘John couldn’t go forward *and* he couldn’t go backward’. Yet (4b), with *and* instead of *or*, is not immediately understood as ‘John couldn’t go forward *or* he couldn’t go backward’: one needs a considerable amount of sophisticated thinking to convince oneself that (4b) is equivalent with ‘John couldn’t go forward *or* he couldn’t go backward’. This is remarkable, because, on the assumption that natural logic equals standard logic, standard propositional logic predicts that the same processing procedure should hold for the two, both being instances of De Morgan’s laws of conversion between conjunction and disjunction. The Gricean maxims, however, have no bearing at all on such cases.

Given the (now more and more acknowledged) inability of the Gricean maxims to bridge the gap between standard logic and natural intuitions, we try a different approach: we say that natural language has its own logic, which differs from standard logic. To see how this can work, we must first see what defines a logic.

### 3. What defines a logic?

Aristotle (384–322 BCE) discovered that a formal theory of textual consistency crucially depends on a handful of words, called OPERATORS or CONSTANTS. For him—as for us—these words are ALL, SOME, NOT, AND, OR, IF (also MAY, MUST, and a few more, but we leave these out of account here). Logical formulae thus consist of operators and variables, the latter ranging over propositions (propositional logic) or over predicates (predicate logic). In any logic, the operators are defined as regards the conditions under which they produce truth (their satisfaction conditions). Standard logic uses satisfaction conditions that mirror standard set-theoretic operations.

The empirical question now is: how are the operators (or rather, the words that correspond to them) defined in natural language—assuming that individual languages do not differ in this respect? If we can define the natural-language logical operators in an empirically valid way, and if these definitions form a sound system of logic, we have the natural logic of language and cognition, which is likely to differ in important ways from standard logic. Logic thus becomes a matter of lexical semantics.

### 4 Four predicate logics

Predicate logic is the theory of (universal and existential) quantification. Given the three quantifiers ALL, SOME and NO, and the negation NOT, either over the whole sentence/proposition (external negation) or over the predicate (internal negation), we distinguish the following twelve basic sentence types (without vacuous repetitions of negations; the variables “F” and “G” stand for predicates):

<b>A</b>	ALL F is G	<b>¬A</b>	NOT [ALL F is G]
<b>I</b>	SOME F is G	<b>¬I</b>	NOT [SOME F is G]
<b>N</b>	NO F is G	<b>¬N</b>	NOT [NO F is G]
<b>A*</b>	ALL F is NOT-G	<b>¬A*</b>	NOT [ALL F is NOT-G]
<b>I*</b>	SOME F is NOT-G	<b>¬I*</b>	NOT [SOME F is NOT-G]
<b>N*</b>	NO F is NOT-G	<b>¬N*</b>	NOT [NO F is not-G]

In those logics where NOT-SOME = NO, the number is reduced to the following eight:

<b>A</b>	ALL F is G	$\neg$ <b>A</b>	NOT [ALL F is G]
<b>I</b>	SOME F is G	$\neg$ <b>I</b>	NO (= NOT-SOME) F is G
<b>A*</b>	ALL F is not-G	$\neg$ <b>A*</b>	NOT [ALL F is NOT-G]
<b>I*</b>	SOME F is NOT-G	$\neg$ <b>I*</b>	NO (= NOT-SOME) F is NOT-G

This ‘language’ will do for the present purpose. But what do the words ALL, SOME, NO and NOT mean? Simplifyingly, we take NOT to be the standard truth-value toggle in all four logics considered. As regards ALL, SOME and NO, they are defined in SMPC as follows (“[[P]]” stands for the *extension* of the predicate P; “<a,b>” stands for the ordered pair ‘a followed by b’):

(5) **Standard Modern Predicate Calculus SMPC:**

$$[[\text{ALL}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \subseteq [[G]] \}$$

(the extension of the predicate ALL consists of the set of all pairs [[F]] and [[G]] such that [[F]] is included in or equals [[G]])

$$[[\text{SOME}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] \neq \emptyset \}$$

(the extension of the predicate SOME consists of the set of all pairs [[F]] and [[G]] such that the intersection of [[F]] and [[G]] is nonnull)

$$[[\text{NO}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] = \emptyset \}$$

(the extension of the predicate NO consists of the set of all pairs [[F]] and [[G]] such that the intersection of [[F]] and [[G]] is null)

(One notes that, under these definitions, NO F is G is simply the negation of SOME F is G.)

The relation with standard set theory is obvious. SOME simply requires nonnullness of the intersection of [[F]] and [[G]], whereas ALL requires inclusion (in the standard sense) of [[F]] in [[G]]. For the rest, truth is determined by the laws and theorems of standard set theory. Thus, in SMPC, ALL F is G is trivially true when [[F]] is null ([[F]] =  $\emptyset$ ), because in standard set theory the null set ( $\emptyset$ ) is a subset of any set. And SOME F is G is trivially true when both [[F]] and [[G]] are nonnull and [[F]]  $\supseteq$  [[G]]  $\neq \emptyset$ , because when these conditions are met, their intersection is nonnull.

It is well-known, however, that natural intuition does not support such truth judgements. For example, ALL F is G is false for natural intuition when there are no Fs and SOME F is G is likewise considered false when either [[F]]  $\subseteq$  [[G]] (so that ALL F is G is true), but true when [[G]]  $\subset$  [[F]]. Aristotle, followed by Abelard (1079–1142), respected the former intuition but not the latter. Their logic, AAPC, is a perfectly sound alternative to SMPC, from which it differs only in that, in the absence of any Fs, ALL F is G is considered false in the former but true in the latter. In AAPC, ALL is characterised by the following definition, while SOME and NO are as in (5):

(6) **Aristotelian-Abelardian predicate calculus (AAPC):**

$$[[\text{ALL}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \neq \emptyset \text{ and } [[F]] \subseteq [[G]] \}$$

(the extension of the predicate ALL consists of the set of all pairs [[F]] and [[G]] such that [[F]] is nonnull and [[F]] is included in or equals [[G]])

$$[[\text{SOME}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] \neq \emptyset \}$$

(the extension of the predicate SOME consists of the set of all pairs  $[[F]]$  and  $[[G]]$  such that the intersection of  $[[F]]$  and  $[[G]]$  is nonnull)

$$[[\text{NO}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] = \emptyset \}$$

(the extension of the predicate NO consists of the set of all pairs  $[[F]]$  and  $[[G]]$  such that the intersection of  $[[F]]$  and  $[[G]]$  is null)

(Again, NO F is G is simply the negation of SOME F is G.)

This formulation differs from (5) only in that there is the extra requirement for the truth of **A** (ALL F is G) that  $[[F]]$  be nonnull. The logic resulting from (6) we call Aristotelian-Abelardian predicate calculus or AAPC.

But this fails to do justice to the other intuition that **I** (SOME F is G) is considered false when either  $[[F]] \subset [[G]]$  or  $[[F]] = [[G]]$ , but true when  $[[G]] \subset [[F]]$  ( $[[G]]$  being nonnull). Our intuition tells us that SOME is to be read as ‘some but not all’. To account for both intuitions, we define ALL, SOME and NO as follows:

(7) **Basic-Natural Predicate Calculus (BNPC):**

$$[[\text{ALL}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \neq \emptyset \text{ and } [[F]] \subset [[G]] \}$$

(the extension of the predicate ALL consists of the set of all pairs  $[[F]]$  and  $[[G]]$  such that  $[[F]]$  is nonnull and  $[[F]]$  is included in or equals  $[[G]]$ )

$$[[\text{SOME}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] \neq \emptyset \text{ and } [[F]] \cap [[G]] \subset [[F]] \}$$

(the extension of the predicate SOME consists of the set of all pairs  $[[F]]$  and  $[[G]]$  such that the intersection of  $[[F]]$  and  $[[G]]$  is nonnull and is properly included in  $[[F]]$ )

$$[[\text{NO}]] = \{ \langle [[F]], [[G]] \rangle \mid [[F]] \cap [[G]] = \emptyset \}$$

(the extension of the predicate NO consists of the set of all pairs  $[[F]]$  and  $[[G]]$  such that the intersection of  $[[F]]$  and  $[[G]]$  is null)(Now, NO F is G is not the negation of SOME F is G because NO F is G and SOME F is G are both false in cases where ALL F is G is true.)

This formulation differs from (6) only in that ALL requires *proper* inclusion of  $[[F]]$  in  $[[G]]$  and that **I** (SOME F is G) requires for truth not only that the intersection of  $[[F]]$  and  $[[G]]$  be nonnull but also that this intersection be properly included in  $[[F]]$ . The logic resulting from (7) we call Basic-Natural Predicate Calculus or BNPC.<sup>3</sup>

There is a fourth predicate logic, the famous SQUARE OF OPPOSITION, often falsely attributed to Aristotle (whose system of predicate logic is AAPC as been defined above). The SQUARE is the product of Aristotle’s commentators Apuleius (±125–180), Ammonius (±440–520) and Boethius (±480–524), who meant to streamline Aristotle’s original system AAPC, thereby unwittingly introducing the logical error of *undue existential import* (UEI). In the Square, the definitions of ALL, SOME and NO are as in (6), but the commentators added the theorem of the so-called Conversions, which holds

---

<sup>3</sup> BNPC is essentially the same as the predicate logic developed by the Edinburgh philosopher Sir William Hamilton (1788–1856), if one forgets about Hamilton’s insistence on ‘quantification of the predicate’, which is not discussed in the present paper (see Seuren, in press, section 3.4.2).

in SMPC but not in AAPC and even less in BNPC. The Conversions are defined as follows:

$$(8) \quad \mathbf{A} \equiv \neg \mathbf{I}^* \quad \text{and} \quad \mathbf{I} \equiv \neg \mathbf{A}^*$$

That is, ALL and SOME are interchangeable provided an external and an internal negation are added. In current terminology it is said that ALL and SOME are *duals* in the systems concerned.

The Conversions do not follow from the semantic definitions of the quantifiers given in (6) but were added as independent elements, which is why they have led to the logical error of UEI: a sound logic is defined exclusively by the semantics of its operators (constants); any further additions may make a logic unsound. In the case of the Square, the logical defect of UEI is not too serious, as it can be eliminated by the addition of a *presuppositional component* to the logic, which then contains the Square as a proper subpart (see Seuren 1988; Seuren, in press Chapter 10).

Apart from the Square, which suffers from the logical defect of UEI, the other three systems are logically sound. The soundness of SMPC cannot be at issue. AAPC is as sound as SMPC.<sup>4</sup> BNPC as defined in (7) suffers from UEI only when situations where  $\llbracket \mathbf{F} \rrbracket = \emptyset$  are left out of account (as they should be in a fully natural logic). But when situations where  $\llbracket \mathbf{F} \rrbracket = \emptyset$  are taken into account, BNPC is again sound (see Seuren, in press, Chapter 3). BNPC suffers from the functional but nonlogical disadvantage that **I**-type sentences are like **A**-type and **N**-type sentences in that their truth cannot be established until the whole universe of objects **U** has been checked—a limitation that is crippling when **U** is infinite. In the case of **A**-type and **N**-type sentences, at least their falsity is established when a counterexample is found, but **I**-type sentences are in principle unascertainable in an infinite **U**. This disadvantage, however, is not of a logical but only of a practical nature.

## 5 Intuitions tested

These four systems are now set off against the following seven natural logical intuitions (“ $\vdash$ ” or “entails”, here: “is felt to entail”; likewise for “ $\equiv$ ” or “is equivalent”, here: “is felt to be equivalent”):

- |   |   |
|---|---|
| 1. SOME F is G $\vdash$ NOT [ALL F is G]                        | $\mathbf{I} \vdash \neg \mathbf{A}$                     |
| 2. SOME F is G $\equiv$ SOME F is NOT-G                         | $\mathbf{I} \equiv \mathbf{I}^*$                        |
| 3. SOME F is G $\equiv$ SOME G is F                             | $\mathbf{I} \equiv \mathbf{I}!$                         |
| 4. ALL F is G $\vdash$ SOME G is F                              | $\mathbf{A} \vdash \mathbf{I}!$                         |
| 5. ALL F is G $\vdash$ SOME G is NOT-F                          | $\mathbf{A} \vdash \mathbf{I}!^*$                       |
| 6. NO F IS NOT-G $\equiv$ ALL F IS G                            | $\mathbf{N}^* \equiv \mathbf{A}$                        |
| 7. NOT-ALL F is G $\equiv$ SOME F is G $\equiv$ SOME F IS NOT-G | $\neg \mathbf{A} \equiv \mathbf{I} \equiv \mathbf{I}^*$ |

The combination of 3 and 4 amounts to the *positive subaltern entailment* from ALL F is G to SOME F is G, found in AAPC and the ABPC (the Square) but not in BNPC or

---

<sup>4</sup> The soundness of, in particular, AAPC may give standard logicians pause to think (see Seuren, in press, Chapter 3).

SMPC. (The positive subaltern entailment schema is not fully or basically natural but is defensible on further reflection.) The four systems score as follows:

BNPC	1, 2, 4, 5, (6) <sup>5</sup>
AAPC	3, 4,
ABPC	3, 4, 6
SMPC	3, 6

BNPC scores best: it misses out only on the intuitions 3 and 7. AAPC and the ABPC successfully account for the intuitions 3 and 4. In both systems SOME is symmetrical (SOME F is G  $\equiv$  SOME G is F) and ALL F is G  $\vdash$  SOME G is F, because when  $\llbracket F \rrbracket \subseteq \llbracket G \rrbracket$  and  $\llbracket F \rrbracket \neq \emptyset$ ,  $\llbracket F \rrbracket \cap \llbracket G \rrbracket \neq \emptyset$ . ABPC has the extra advantage of accounting for intuition 6, since in that system NO F IS NOT-G and ALL F IS G are equivalent in virtue of the Conversions. Standard modern predicate calculus (SMPC) accounts for the intuitions 3 (SOME is symmetrical) and 6 (NO F IS NOT-G  $\equiv$  ALL F IS G in virtue of the Conversions).

None of the systems is able to account for intuition 7. ABPC and SMPC come closest in that there NOT [ALL F is G]  $\equiv$  SOME F is NOT-G, but SOME F is G and SOME F is NOT-G are not equivalent in these systems. In BNPC, when NOT [ALL F is G] is true, then either SOME F is G (=SOME F is NOT-G) or NO F is G is true, but the latter possibility is so counterintuitive as to be semantically abhorrent. In AAPC, SOME F is NOT-G  $\vdash$  NOT [ALL F is G] but not vice versa, because when  $\llbracket F \rrbracket = \emptyset$ , NOT [ALL F is G] is true but SOME F is NOT-G is false.

The explanation proposed falls back on topic-comment structure (information structure). We formalise topic-comment structure as an underlying cleft structure where *all* has comment status. It is assumed that the default analysis of a sentence like *Ben didn't eat all of his meal*, is 'what Ben ate of his meal was not all', entailing presuppositionally that Ben ate some of his meal and thus excluding the case that he ate nothing. Thus read, the sentence PRESUPPOSES that Ben ate some of his meal and ASSERTS that he did not eat all of it. Similarly for (9a), which, if analysed as (9b), excludes the case that there are no green flags:

- (9)a. Not all flags are green.
- b. 'the flags that are green are not all (flags)'

Thus, to the extent that NOT-ALL denies the comment ALL, the intuitive equivalence of SOME F is (NOT-)G with NOT-ALL F is G is explained by topic-comment structure.

It seems that we have to conclude that the totality of natural logical intuitions held by logically naive humans does not fit into a single logical system. In order to account for all the intuitions, a distinction will have to be made between a *basic-natural* and a *strict-natural* system of predicate logic.

---

<sup>5</sup> The equivalence expressed in Intuition 6 follows from BNPC only when situations where  $\llbracket F \rrbracket = \emptyset$  are left out of account, as they are by those who operate with BNPC as 'their' predicate logic.

## Abstract

The mental representation of an utterance emerges piecemeal and dependent on the flow of incoming information. This urges the conceptualizer to arrange the message according to the linear order requested by the syntactic formulator. This would argue for a language specific form of the message. Most evidence, however, stem from analyses that tested the processing for a single processing level and separately from what happened on the corresponding input- and output levels.

Speakers of Chinese, German and Polish produced Yes/No-questions, which are coded differently in the three languages. Using a two choice Go-NoGo Paradigm with LRP measures, we tested the chronological correspondence of conceptualization and the syntactic coding processes. The results are at variance with the first-in-first-out model.

**Keywords:** Semantic representation, Linguistic relativity, German, Polish, Chinese, Utterance production.

## Theoretical background

Utterance production and comprehension run fast and almost without any trouble. This is highly remarkable, given the considerable bulk of phonetic, morphological, syntactic features to be processed within milliseconds. The widely accepted explanation claims a model with multiple subsystems working in parallel and on-line; cf. Levelt (1989), Dietrich (1999), Levelt et al. (1999), Guhe (2007), Kamide, Altmann & Haywood (2003). The system is assumed to have a hierarchical architecture with the information circulating basically bottom up while comprehending and top down while producing an utterance. As soon as a suitable bite of information is treated by a subsystem it is handed over to the next one for further processing. The size and the content of an acceptable bite are determined by the receiving system's input constraints. For a highly simplified model of the entire mechanisms, see fig. 1.

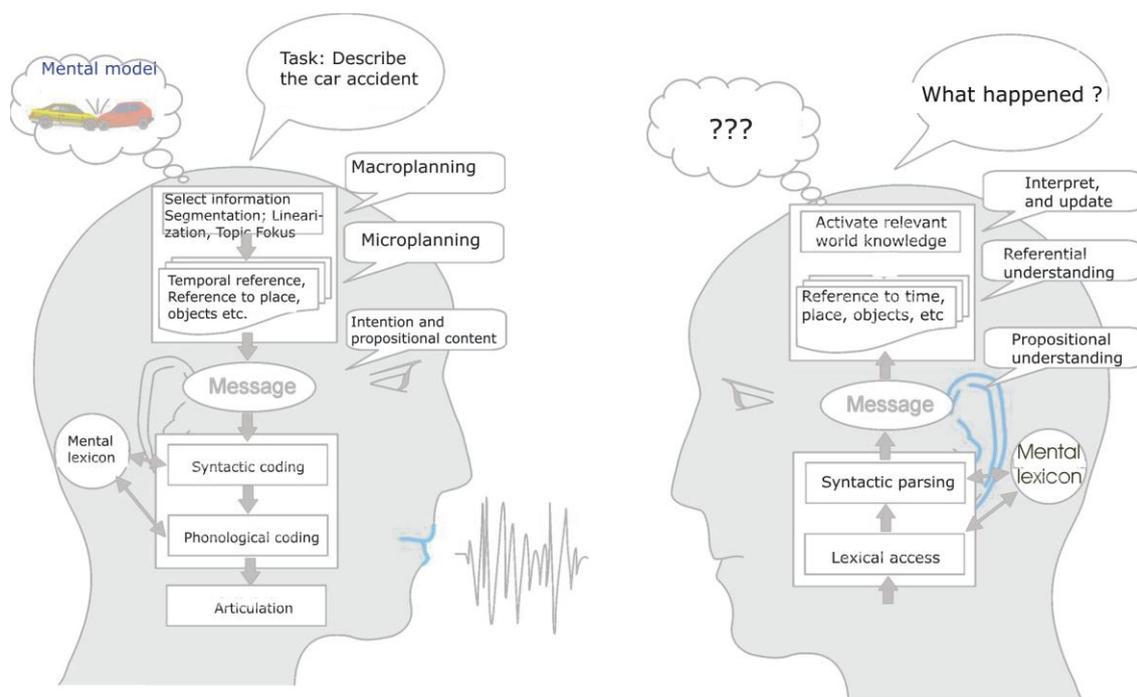

Fig. 1: Systems and subsystems of language production and comprehension

What does this tell about the interaction of language and cognition? For most of us, it may not come as a big surprise that the child's laborious struggling with language acquisition drills his/her conceptualizer in serving its thoughts to the computational system in palatable bites, at least as far as the content of the message is concerned.

Does this, however, also apply to the form of the message? How far down the production line does the conceptualizer peer forward? How much syntactic information does it prearrange and, by this, ease the formulator's task? And, given, that this is a justifiable question, how can it be investigated?

Languages differ widely in word order, as we all know, and yes/no- questions lend themselves as a suitable area for testing the readiness of the conceptualizer in serving the computational system. In Chinese, for instance, a yes/no-question is typically expressed by the Q-particle *ma* or an A-non A lexical item. Its position is sentence final, after the very end of the syntactic form of the rest of the sentence; cf. Gasde (2004: 299 and 302):

- (1) Ni kan dianying bu-kan?  
you watch movie not-watch
- (2) 'Will you watch the movie?'  
Ni ba shu nazou-le ma?  
you BA book take away-ASP QP  
'Have you taken away the book?'

German is different in this point. The yes/no-question is expressed by putting the finite verb into the sentence initial position and, hence, opposed to the word order of Chinese. This raises the question whether and how the conceptualizer may attune to word order differences. Does it anticipate the word order of the sentence to be coded syntactically? If so, can we predict that – in German – the illocutionary force of an utterance is conceptualized ahead of the propositional content while in Chinese it is planned only after delivery of the proposition?

(3) Ist das rechte Auto rot? (*Is the car on the right red?*)

How can we find out? Utterance production is a cognitive activity and cognitive processing takes time. The dynamics of utterance production, in particular, bears strong resemblance to a standard assembly belt procedure. The utterance emerges piecemeal. As soon as the conceptualizer has produced a fragment that possesses enough information for being coded syntactically, the computational system starts working. Lexical material is activated and the syntactic structure is fabricated on-line according the lexical features and the syntactical constraints of the respective language.

### Hypotheses

If humans are equipped with a cooperative preverbal system we should expect that, as a result of language acquisition, it will have adapted to the syntactic peculiarity of the speaker's language.

**H1:** The Chinese conceptualizer will, accordingly, anticipate the dynamics of the computational system and provide the syntactic coding first with the propositional content and only after this with the illocutionary information “yes/no-question”. The German speaker, on the other hand, will have set up a conceptualizer that delivers the concept “yes/no-question” first followed by the rest of the message, i.e. the propositional content (see figures 2 and 3, respectively).

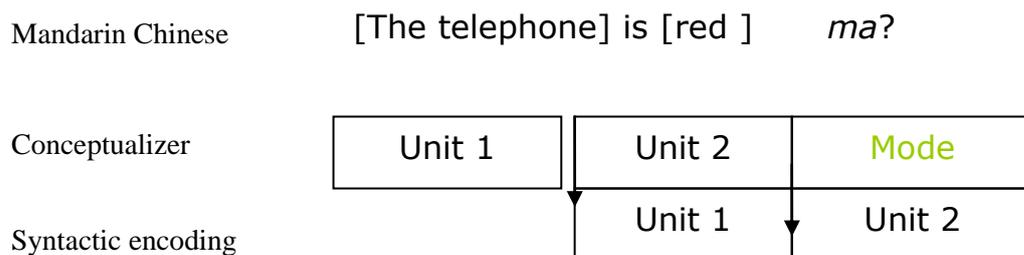

Fig. 2: Semantic-syntactic interface of the Mandarin Chinese production system.

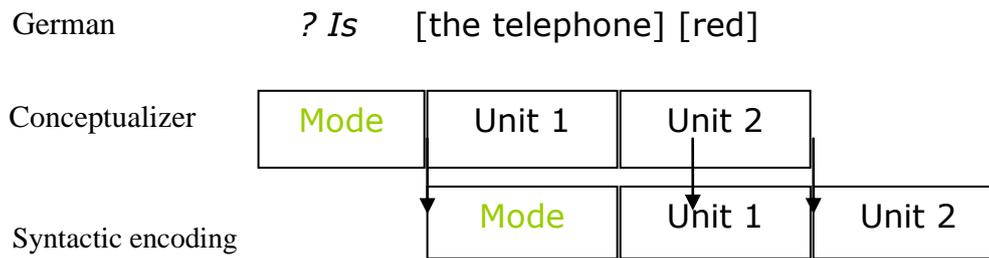

Fig. 3: Semantic-syntactic interface of the German production system

**H0:** If, however, we are genetically provided with a more rigid cognitive system it might not be so flexible as to adapt to the word order constraints of the input language as a result of language acquisition. It may have developed a universal standard pattern for the yes/no message and leave the whole bunch of ordering to the syntactic component. How can we find out about what is the case? How can the conceptual system's processing be observed on-line?

### Experiment 1

We used the LRP Go/NoGo paradigm (with a two choice match-mismatch decision task. For the experimental setups for GO-trials and NoGo-trials, see fig. 4 and 5, respectively. For a brief sketch of the LRP-method, see Rugg & Coles (1997: 97-100); amore thorough presentation is Sommer, Ulrich & Leuthold (1996).

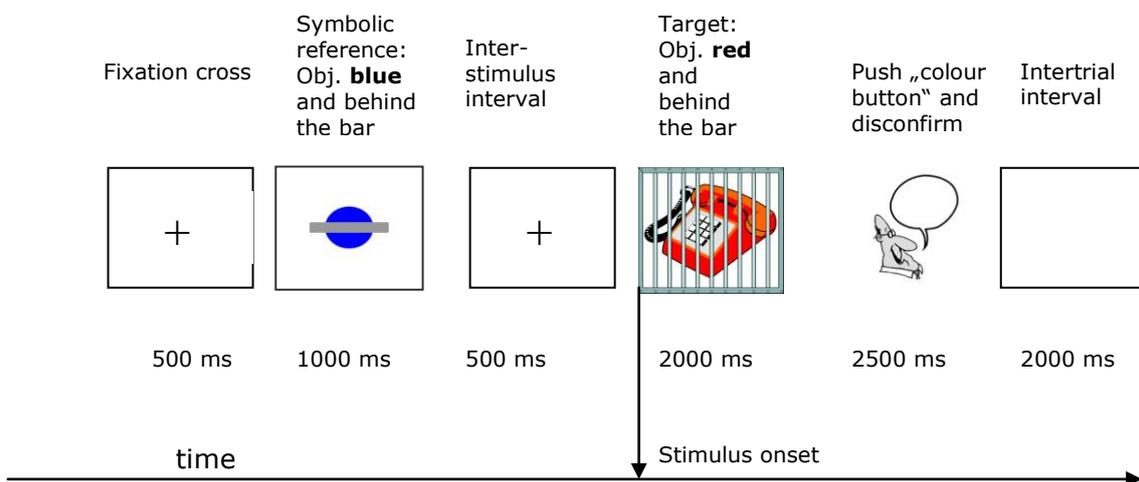

Fig. 4: Experimental set up for Go-Trials. The correct response to this target picture was (1) press the “colour button” and (2) say: *The telephone is red.*

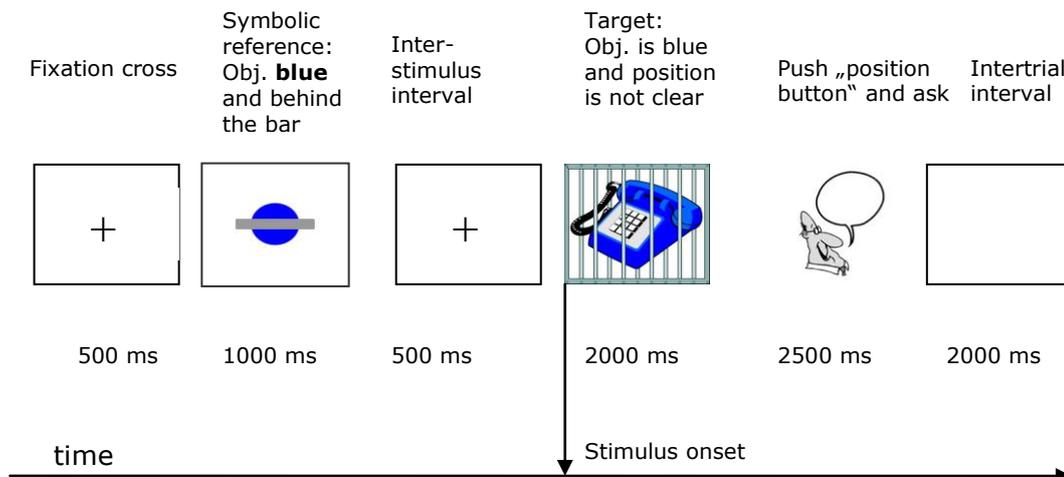

Fig. 5: The experimental set up for NoGo-trials (position). The correct response to this target picture was (1) withhold the button press upon the position button and (2) ask: *Is the telephone behind?*

The experimental procedure comprised four steps. First, a so called reference configuration of a coloured dot in front or behind a silvery rectangular bar appears on the computer screen. By the instruction, the subject knows that this reference picture announces the colour of a target object appearing after it and its position (Step 2). The subject shall then compare the features of the reference picture with those of the target and if they match confirm the correspondence or disconfirm if they don't match. In this case, there are two possibilities. If the colour does not match the subject is to disagree by pushing a button (step 3) and by telling the correct colour (step 4). Example: *Das Telefon ist rot. [The telephone is red]*. If it is the position of the target that does not match that of the reference symbol the subject is to press an alternative button and to tell the rectified position like, for instance, *Das Telefon ist vorne. [The telephone is up front]*. These are the so-called Go-trials. In some trials, the colour or the position of the target, but not both, cannot be identified by means of the picture alone. In this case, the subject is asked to withhold the prepared button press and to ask for the unavailable information on the basis of the reference item: *Ist das Telefon blau? [Is the telephone blue?]* or *Ist das Telefon hinten? [Is the telephone in the back?]*.

The subject has, accordingly, to decide on two choices, left or right button for the content of the proposition (colour or position) and "Push" (GO) or "don't push" (NoGo) the button for the illocution ("disconfirm" or "ask"). In our procedure, the content was coupled with the choice of the button and the illocution with the Go/Nogo response. Three kinds of data were recorded for each trial, the Go- or Nogo LRP, respectively, the reaction time (target Onset – button press), and the spoken utterance.

What did we expect? Given the incremental making of the message, we would predict a button press on all Go-trials, preceded by a GO-LRP.

In the Nogo-trials, we would predict no button press and a Nogo-LRP before the Q-final utterances (i.e. in Chinese) but no Nogo-LRP before the Q-initial utterances in German.

## Results

What did we expect? What we predicted was a Go-LRP in all Go-trials preceding and indicating the immediately following button press with the left or right hand, respectively, corresponding to the propositional content “colour” and “position”. In case of unclear target pictures, German speakers were predicted to conceptualize the sentence mode first followed by the conceptualization of the propositional content. The decisions of whether to press or not to press the button would precede the choice of the correct hand. In NoGo-trials, then, no hand had to be prepared and no button press had to be withheld. No NoGo-LRP was expected to show up.

Speakers of Q-final languages like Chinese, on the other hand, would – theoretically – need to look out for the colour and the position of the target first, decide on the correct hand and prepare the button press. In trials with unclear target pictures the movement would have been withheld and a broken-off-LRP (NoGo-LRP) should be visible.

What did we find? The Chinese results (N = 23, 480 trials each, 23 – 36 years old, mean age = 26, 11 female; all subjects were paid for the participation in the exp.) show a distinct NoGo-curve. It starts at a mean of 364 ms and peaks (1.7  $\Phi$ v) at 540 ms. This is what we had expected, given the Q-final marking of y/n-questions in Chinese, see fig. 6.

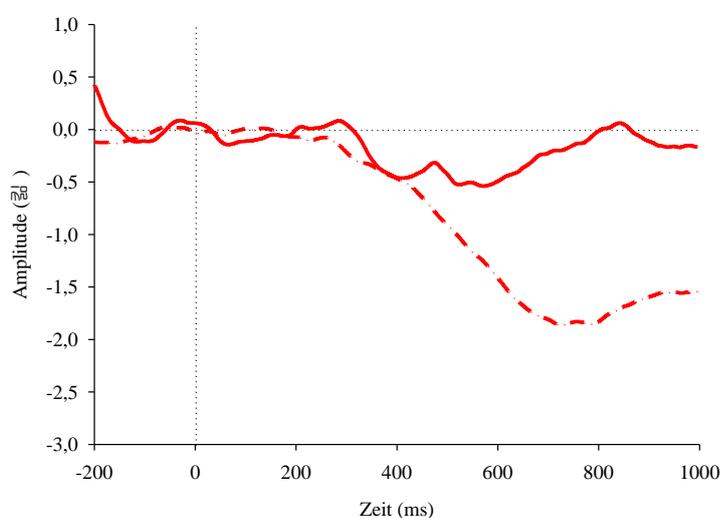

Fig. 6: Chinese: Go-LRP (dotted line) results from disconfirmation trials and NoGo-LRP (solid line) results from “ask”-trials.

For German, we expected GO-potentials, of course, but no significant Nogo-curve. As a consequence of the utterance-initial planning of the Q-component there is no need for preparing a hand for button press since no button has to be pressed. 18 German speakers (19-29 years old, mean age = 26, 12 female) participated in the experiment. The data analysis, however, yields a clear cut Nogo-pattern for German as well; see fig. 7.

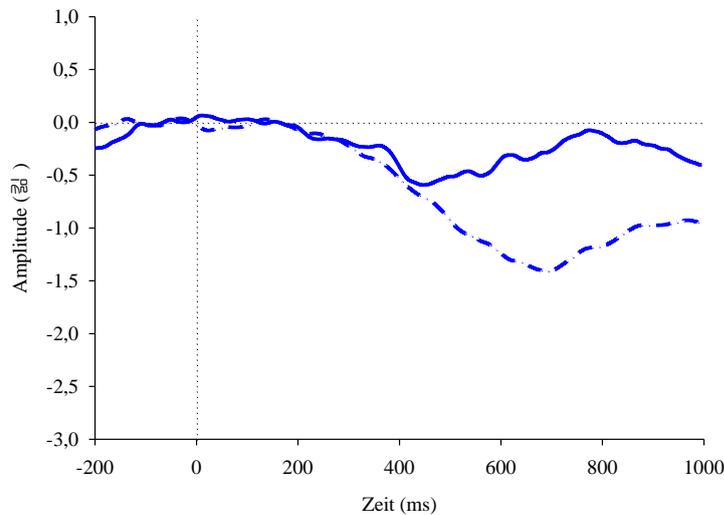

Fig. 7: German: Go-LRP (dotted line) results from the disconfirmation trials and NoGo-LRP (solid line) results from “ask”-trials.

## Discussion of experiment 1

Chinese is a Q-final language in which the propositional content of the message is planned first and the sentence mode only at the end. The NoGo-response is consistent with our prediction. This is different for Q-initial languages like German. The sentence mode is assumed to be planned first and, therefore, no hand has to be prepared and no NoGo-LRP should have developed. The results contradict this prediction without any doubt. The data show NoGo-LRPs in both languages, Chinese and German, irrespective of the syntactic position of the yes/no-question marker.

A straight interpretation of this finding would say that the conceptualizer does not care about syntax. It simply follows a universal pattern of message planning: propositional content first and sentence mode last.

There is, yet, another explanation for the uniform results. Let us suppose that the people prepare the hand movement very fast. Then, they perceive the lack of colour/position information in the experimental target pictures. As soon as the lack of information is realized the hand movement is withheld and the question is conceptualized only now; language processing comes to pass only after the early and prelinguistic cognitive activities. This scenario would also produce NoGo-LRPs in all experimental trials but not due to the typological features of languages but caused by “higher” problem solving procedures. We tested this assumption in a subsequent experiment without the verbal component.

## Experiment 2

The experimental setting of experiment 2 was the same as in experiment 1. The task, however, was different. Subjects were asked to only press a predetermined button

with one hand in case of colour mismatch and to press another button with the other hand in case of mismatch of the position of the target object. If either the colour or the position of the target object were not clear to them they were instructed not to press any button at all. If the NoGo-LRP originates in the early motor- and perception part of the entire procedure it should occur in the non-verbal condition as well. Fig. 8 shows the experimental setup of the experimental trials.

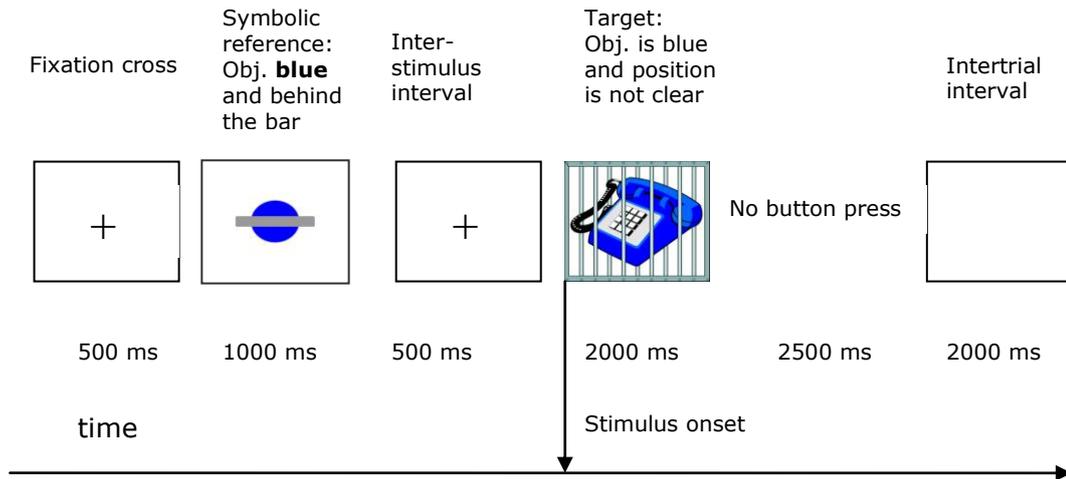

Fig. 8: The experimental setup for the experimental trials (here: position) in experiment 2, i.e. without speaking.

## Results

Assume that the NoGo-potentials had been produced in reaction to the fast early preparation of hand movement followed by the perception of missing information. Then we would expect both Go- and NoGo-reactions in this non-linguistic experiment as well. Fig. 10 shows the results (N=22 Germans, 480 trials each).

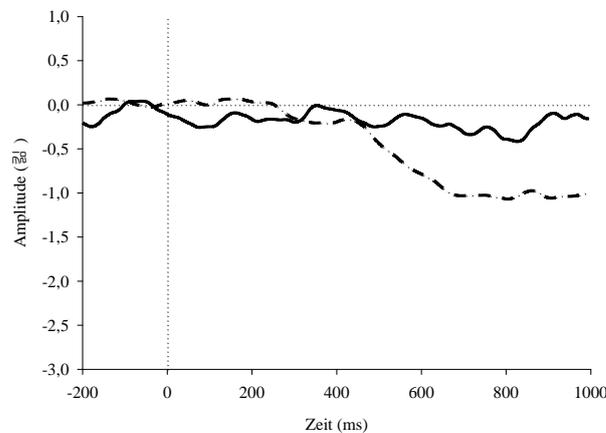

Fig. 10: Mismatch-condition (dotted line) and experimental trials (strong line).

The reaction to the mismatch condition evoked a clear Go-LRP while the reaction in the unclear condition did not cause a NoGo-LRP. This tells us that the NoGo-reaction is specifically related to the speaking condition and cannot originate from the nonverbal part of the task.

### Discussion of experiment 1 (cont.)

The next question now is what could have evoked the Nogo-LRP in the Germans' reactions in the "question"-condition in experiment 1? In German, the yes/no-question is expressed by placing the finite verb in the sentence initial position. Typologically, this is, however, not the basic word order of German. German is an SOV language. The placement of the finite verb in the surface of the utterance could, thus, result from merely syntactic operations which are performed during the syntactic coding. The conceptualizer, on its side, may only be adjusted to the base generated structure and, therefore, put the Q-concept at the end of the message just like the Chinese speakers.

### Experiment 3

In order to examine this possibility, we had to run the experiment with subjects whose language has definitely Q-initial order for yes/no-questions. Polish is such a language. The yes/no-question is syntactically expressed by putting the question particle *czy* in front of the sentence. The rest of the sentence is left unchanged in main clause SVO order. 19 Polish speakers (between 19 and 27 years old, mean 23 years, 10 female) participated in the experiment. The setup of the experiment was the same as in experiment 1. Again and unexpectedly, the Polish experiments yielded a clear significant NoGo-result, too, as shown in fig. 11.

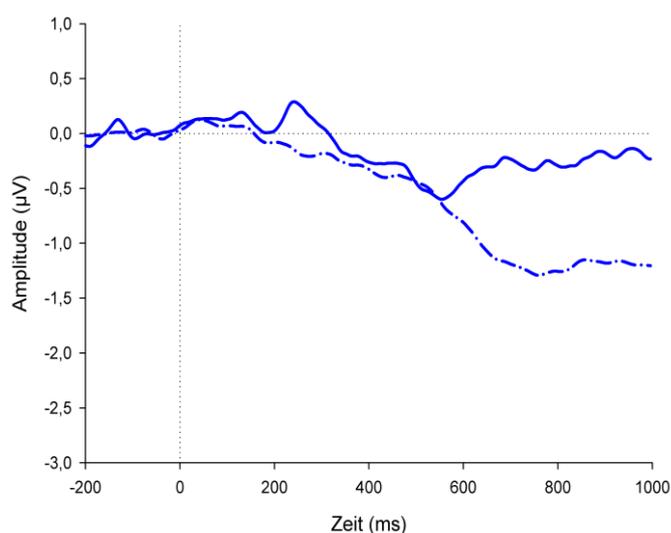

Fig. 11: Polish: Go-LRP (dotted line) results from the disconfirmation trials and NoGo-LRP (solid line) results from "ask"-trials.

## General discussion

The aim of the study was to tackle the question of language universals from a psycholinguistic point of view. The focus was on the format of the semantic representation of the utterance. The experiment was designed to operationalize the question as to whether the form of the semantic representation of a given sentence differs in different languages or not. From a psycholinguistic perspective, there are plausible reasons for both hypotheses. The background of the theoretical reasoning is the widely accepted assumption that the language processor produces and comprehends utterances online. This is achieved by a sophisticated division of labour among a set of subsystems working in parallel. The two subsystems under consideration here are the conceptualizer and the syntactic part of the formulator. The conceptualizer plans the content of the utterance; its output is the semantic representation, the so called message. The message contains the information that triggers the access to the appropriate lexical material including the syntactic information that is required by the syntactic subsystem for building the structure of the sentence. Here, at the interface of the two subsystems is where the question arises whether the conceptualizer looks forward to language specific properties of word order or not. If it does one would expect a language specific order of the message, i.e. of the semantic representation, as well. In the opposite case, i.e. if the conceptualizer does not look ahead to any word order constraints of a given language, this could be taken as evidence in favour of a universal property of languages. The two possibilities were tested against each other in two experiments and a control experiment. Speakers of three languages that feature distinct syntactic constructions for yes/no-questions were observed online while producing messages of yes/no-questions. All together, the results do not show any significant differences in the time course of the conceptualizer's work. Chinese, German and Polish speakers produce the semantic representations of yes/no-questions in the same uniform way in spite of clear distinctions of word order at the syntactic level. The results of the control experiment proved the validity of the experimental operationalization. The findings originate in the verbal part of the complex experimental task. Still, the general conclusion is questionable. Without doubt, the results are consistent with the universality hypothesis but the alternative position is not falsified. There is no positive evidence. There is however some more independent evidence in favour of the universality-assumption.

The results of the control experiment testify that the observed NoGo-responses originate in the activation of the linguistic procedures and not in preceding non-linguistic processing like, for instance, early sensory-motor activities.

From the nature of the experimental task we can conclude that the experimental procedure was valid. In planning the content of a verbal disconfirmation and questioning, the colour or the position of an object in comparison to a given reference object are definitely semantic procedures.

The post hoc-evaluation of the S-LRP latencies yields one more revealing result. If the onset latency of the NoGo LRP is defined as the point of time where the amplitude reaches 60% of the maximum value there is a significant main effect of the factor language ( $F(2,55) = 5,82, p < .01$ ). The multiple t-test shows that the NoGo-LRP of the Polish speakers develops significantly later than that of the Chinese speakers ( $t(36) = 8,18, p < .01$ ) and also later than that of the German speakers ( $t(37) = 11,84, p < .01$ ). There is plausible explanation of this language specific difference. In Polish,

the Q-particle *czy* is placed before the first lexical item of the propositional content. Consequently the syntactic coding has to know the exact beginning of the propositional part of the message. In order to guarantee a secure access to this information the system provides an interim back up of the entire propositional information and that is neither required in German nor in Chinese.

## Abstract

Verb aspectuality plays a crucial role in the analysis of sentence-meaning as it constitutes a framework of Event Structure and affects a human cognitive structure. In case of the Korean verb *chac-ta*, however, the realization of aspectuality becomes ambiguous. In this study, we classify *chac-ta* ‘seek/find’ as an accomplishment verb encompassing sub-event of a *process* and a *result state* in the framework of *Generative Lexicon Theory* (Pustejovsky 1995). In this line of analysis, *chac-ta* shows an *underspecified headedness* feature, by which whether the subevent of *chac-ta* is *headed* or *headless* depends on the instantiation vs. duration adverbs and aspectual auxiliaries. Additionally we examined the *intensionality* and *extensionality* of *chac-ta* and defined new *lexical conceptual paradigm* (lcp) of its complement as a *dotted object* in the *formal* quale of *chac-ta*, shown as {existence·location, location, \*existence}. This study is significant in that we applied a new concept to *chac-ta* while sticking to the *Generative Lexicon Theory*, which provides a subevent analysis. But, it also leaves a burden on us of generalizing the phenomenon *intralinguistically* and *crosslinguistically*.

**Keywords:** Generative Lexicon Theory, Aspect, Event Structure, Underspecified Headedness.

## 1. Introduction

The lexical ambiguity has many variations in its types and has been studied for a long time, since it can elicit various interpretations of a single event especially when a verb (or verbal phrase) is ambiguous, in which the verb has a central role in an event description. In a way, it is also an important issue in a lexicon study whether we should consider a word which has various meanings as a *polysemy* or not. In this study, we explored a Korean verb *chac-ta*, which shows an ambiguity in its aspectual meanings, by crosslinguistic study, and suggested a cognitive mechanism to explain its related event structure.

### 1.1. Ambiguity of *chac-ta*

In Korean, *chac-ta* has two different meanings: *look for (try to find)* and *find*. See the following example (1).

- (1) a. *Ilh-eperi -ess-ten sinpal-ul pangkum chac -ass -ta.*  
 Lose-completely-PAST-REL shoes-ACC just find -PAST-DEC  
 “(I) just found the missing shoes.”
- b. *Chelwu-nun Younghee-lul chac -ko iss -ess -ta.*  
 C-Top Y-ACC look for -PROG-PAST-DEC  
 “Chulsoo was looking for Younghee.”

In (1a), the utterer implicates that he has found the shoes by saying *chac-ass-ta*.<sup>1</sup> In contrast, just by listening *chac-ko iss-ess-ta*, we can easily know that *Chulsoo* has not found *Younghee* yet in (1b). In both cases, the verbal phrase has the same verb *chac-ta*, but one event has terminated with a *result state* and the other hasn't. In a word, *chac-ta* has two ambiguities in Korean: *ambiguity in meanings* (find/look for) and *ambiguity in aspects* (result state/progress). One easy way to deal with this problem may be to consider *chac-ta* as a *homonymy*, in which two different words have the same form accidentally. In this view, the meanings of *chac-ta* seem to be determined by its suffixes.

By scrutinizing example (2), however, we need something more than this simple solution.

- (2) a. *Mia-nun ecey ku-lul chac-ass -ta.*  
 M-Top yesterday him-ACC find-PAST-DEC  
*Kuliko, kutul-un manna -ass -ta.*  
 And, they-NOM meet-PAST-DEC  
 “Mia found him yesterday. And, they met.”
- b. *Mia-nun ecey ku-lul chac -ass -ta.*  
 M-Top yesterday him-ACC look for-PAST-DEC  
*Kulena, ku-nun keki eps -ess -ta.*  
 But, he-NOM there is not-PAST-DEC  
 “Mia looked for him yesterday. But, he wasn't there.”

---

<sup>1</sup> In this example, *chac-ass-ta* is ambiguous in nature, but this ambiguity is clearly resolved by the adverb *pangkum* (just).

As you can see in (2a) and (2b), **chac-ta** has different meanings in those two examples though it is combined with the same past suffix *-ass*. In this case, **chac-ta** is still ambiguous after combined with the suffix *-ass* and this ambiguity is resolved when we encounter the following clause. Thus, it seems that **chac-ta** is *not* simply a *homonymy*.

Let's consider it in the context of two different kinds of negation in example (3).

- (3) a. *Swumi-nun ecey halwu congil kangaci-lul chac-ci mos ha -ess -ta.*  
 S-Top yesterday all day long dog-ACC find-not possible do-PAST-DEC  
 "Yesterday, Sumi couldn't find her dog all day long."  
 b. *Swumi-nun ecey halwu congil kangaci-lul chac-ci anh -ass -ta.*  
 S-Top yesterday all day long dog-ACC look for-not-PAST-DEC  
 "Yesterday, Sumi didn't look for her dog all day long."

While the negative *-anh-* influences the whole complex event of **chac-ta** in (3b), the negative ability modality *-mos ha-* in (3a) governs only the subevent *find* of **chac-ta**. As a result, they show different meanings. Likewise, **chac-ta** shows a complex behavior in Korean. Then, how about other languages? Let's talk about it in section 1.2.

### 1.2. Crosslinguistic considerations

It is very useful to conduct a crosslinguistic study when analyzing the meaning of **chac-ta** in Korean. In many languages, **chac-ta** is classified into two different verbs: *find* and *look for*. Observe example (4).

- (4) a. *Chac-u-la. Kulemyeyn, chac-ul kes-iyo. (Korean)*  
 b. *Cherchez, et vous trouverez. (French)*  
 c. *Seek and you will find. (English)*  
 d. *Sagashinasai. Sousureba mituskaru. (Japanese)*

**Chac-ta** is classified as two words in French: '*chercher*' trying to find (*atelic*) and '*trouver*' a result of finding (*telic*). In English, just like in French, '*look for/seek*' and '*find*' are dissociated. The former indicates a *process* or an *activity*, whereas the latter indicates a *result state* or an *achievement*. All things considered, **chac-ta** in Korean is very special. But, from the event structure of **chac-ta**, '*trying to find*' and '*result state*' are deeply related and we assume **chac-ta** is a *polysemy* that is realized differently in various contexts.

### 1.3. Scope of this study

In order to confirm our assumption and explain the behavior of *chac-ta*, we applied the *Generative Lexicon Theory* to *chac-ta* (Pustejovsky 1995). Pustejovsky cited Weinreich (1964) to explain a lexical ambiguity, and raised issues of *contrastive ambiguity* and *complementary polysemies*. According to his theory, *chac-ta* in Korean can be analyzed to have a feature of *complementary polysemy*. To validate this explanation, we showed the various aspect analyses of *chac-ta* in Korean at first. But, *chac-ta* couldn't be fully represented in a simple accomplishment event and thus we also suggested a *headedness* event paradigm for *chac-ta*.

We have showed that the Korean verb *chac-ta* is a special accomplishment verb with *underspecified headedness* of a complex event. Also, it has intensional and extensional features at the same time. In the meantime, we could suspect a new possibility of explaining *intensionality* as weak *veridicality* from the event structure of *chac-ta*.

## 2. Aspectuality study of *chac-ta*

### 2.1. Aspectual classes of verbs

The aspectual meaning of verbs is mainly determined by a lexical meaning (Kenny 1963, Vendler 1967). According to Vendler (1967), verbs are classified into four classes by its temporal stages such as a state change, a process, and a natural telic point: *state*, *activity*, *accomplishment*, and *achievement* (See the table 1). In contrast, Verkuyl (1972, 1989) and Dowty (1972, 1979) argued that the aspectual meaning of verbs can't be simply determined by their lexical meanings. And, Parsons (1989) incorporated an event within an argument structure, but with no subevent analyses. Smith (1991) suggested a *semelfactive* event.

Table 1 The properties of the four classes by Vendler (Kearns 2000)

	Change	Duration	Telicity
State	-	+	-
Achievement	+	-	+
Activity/Process	+	+	-
Accomplishment	+	+	+

The classification of the Korean verb shows a more complicated feature. It's mainly because the aspect of a main verb is heavily correlated with auxiliary verbs. Please refer to Nam (1978), Lee (2001), and Cho (2007) for more details. Likewise, verbal aspect plays a crucial role in the analysis of sentence-meaning, and we first verified various aspectual features of *chac-ta* and differentiated their interpretations according to its aspectual classes.

## 2.2. Aspectual class of *chac-ta* in Korean

As we have seen in (1), the aspectual difference of *chac-ta* mainly results from its suffixes. From this fact, we analyzed co-existence constraints of suffixes. First of all, *chac-ta* can't be a *stative* verb because (1b) is allowed in Korean. Generally, *statives* are ill-formed with the progressive *-ko iss-*. Secondly, *chac-ta* has a *result state* in (1a), and thus can't be an *activity*, which is a simple process. If *chac-ta* is neither a *stative* nor an *activity*, it may be classified as an *achievement* because *chac-ta* has an instant feature when something is found. This assumption is, however, not valid because an *achievement* verb is anomalous with progressive as shown in (5).

(5) \*Jones was recognizing the woman when she sneezed. (from Kearns)

Then, is *chac-ta* an *accomplishment* verb? But, an *accomplishment* verb usually has a long duration before it reaches a culminating point of the event. Consider a typical *accomplishment* verb, *build*, which takes a long time until finished. This contradiction may be easily resolved if we define two different cases of *chac-ta* in (6).

- (6) a. *chac-ta*<sub>1</sub>: seek, look for (*activity*)  
b. *chac-ta*<sub>2</sub>: find (*achievement*)

We call this approach a *Sense Enumeration Lexicon* (SEL). This may be partially right, but a view that *chac-ta* is a *homonymy*, which claims that it has two different senses, is not a good approach, in that word senses are not atoms but overlap and make reference to other senses of word - *the Permeability of Word Senses* (Pustejovsky 1995).

For these reasons, we assume that *chac-ta* is a *polysemy* and tentatively classify *chac-ta* as an *accomplishment* verb. On this basis, we will explore its lexical structure and show the exact feature of it. Vendler's aspectual classification can be re-classified as *simple event* and *complex event* (Lee 1990, Nam 2004, Kim 2004). In this classification,

*chac-ta* is a *complex event* which has two different subevents. More specifically, *chac-ta* is distinguished from other *accomplishment* verbs in terms of its event structure.

### 2.3. Event structure of *chac-ta*

By analyzing the senses of *chac-ta*, we have seen that the aspectual meanings of *chac-ta* are relying on its subevents structure. The next goal will be an integration of two aspectual meanings into a single accomplishment event. To achieve this goal, we introduce the *Generative Lexicon Theory* (Pustejovsky 1995). In this framework, we can divide a complex event into a few subevents and show the phenomenon of lexical meaning explicitly within an event structure. Let's first consider a typical accomplishment verb *build*, which encompasses a building *process* and a created *state* simultaneously. In example (7) below, we can see the characteristics of *build* as an *accomplishment* verb, including a well-known *imperfective paradox* in (7d).

- (7) a. Mary built a house in a year. (*accomplishment*)  
 b. \*Mary worked in an hour. (*activity*)  
 c. John is running. (Therefore, John has run.)  
 d. John is building a house. (\*Therefore, John has built a house.)

All the features given in (7) are well suited for *chac-ta* except for the *imperfective paradox*. Consider the following (8).

- (8) a. *Mia-nun Sue-lul chac -ko iss -ta.*  
 M-Top S-ACC look for-PROG-DEC  
 "Mia is looking for Sue."  
 b. *Mia-nun Sue-lul chac -ass -ta.*  
 M-Top S-ACC seek/find-PAST-DEC  
 (i) "Mia found Sue." *a* doesn't entail *b*. (*imperfective paradox*)  
 (ii) "Mia looked for Sue." *a* entails *b*. (*no imperfective paradox*)

*Chac-ass-ta* in (8b) has different meanings according to two distinct readings. When we focus on the result state (*result state reading*), the *imperfective paradox* will occur as in *build*. However, there is no *imperfective paradox* if we focus on the process itself (*process reading*). We assume that this difference comes from the different *event structure* of two verbs, *build* and *chac-ta*.

- (9) a. *build* [e<sub>σ</sub> e<sub>1</sub>\* <∞ e<sub>2</sub>]  
 b. *chac-ta* [e<sub>σ</sub> e<sub>1</sub> <∞ e<sub>2</sub>]

Thus, we suggest, though both verbs have two subevents *process* and *state* in their *event structures* with temporal order as shown in (9), *chac-ta* has no *head* of the event which is shown in *build*. This *underspecified headedness* provides two distinct readings. The underlying mechanism of headedness is given by *composition*.<sup>2</sup> In the following section, we will discuss it in detail.

#### 2.4. Lexical Structure of *chac-ta*

In *Generative Lexicon Theory*, a word has four substructures: *Argument Structure*, *Event Structure*, *Qualia Structure*, and *Lexical Inheritance Structure*.<sup>3</sup> For example, *chac-ta* has one *true argument* of target. A *qualia structure* is modes of explanation and imposes a relational power between lexical items. Specifically, the *qualia structure* has four items such as *constitutive*, *formal*, *telic*, and *agentive*, which will explain the internal relations of the lexicon. Actually, the *imperfective paradox* of *build* is well explained in terms of the *qualia structure*. That is, a *build-act* is applied to the material constituents of a future house without saying that there already exists a house, in an atelic way.

Note that the *qualia structure* provides us a structural model to apply semantic transformational rules to modify the meaning of a lexical item or phrases. This is a theoretical ground of the *composition*. Consider example (10).

- (10) a. Mary *baked* a potato.  
 b. Mary *baked* a cake.

Depending on the object, *bake* in (10) has different senses: *change of state reading* (a) and *creation reading* (b). After *composition* of the arguments and verbs, they change the *event structure*, and this is exactly what happens in sentences including *chac-ta*. As *bake* goes through change of meaning from *state change* to *creation*, *chac-ta* also experiences the creative mechanism of *composition* when it combines with aspectual markers such as *-ko iss-* and *-ass-* or adverbs.

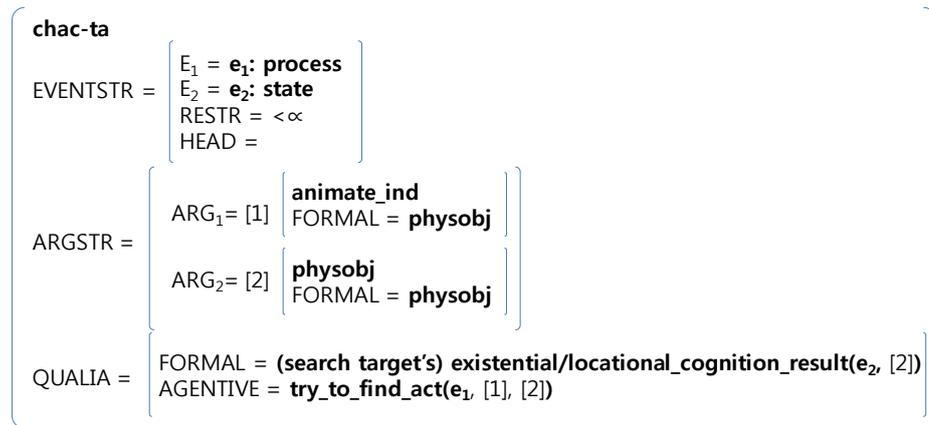

---

<sup>2</sup> The *composition* process is not equal to the *co-composition* suggested by Pustejovsky (1995) in that it is just a combination process of two arguments.

<sup>3</sup> Refer to Pustejovsky (1995) for details.

However, a prior interpretation process is needed to determine the exact meaning because *chac-ta* has no *event head* initially. This is also done during *composition* process. If the *result state* is ignored and the subevents remain *unheaded*, *chac-ta* has *process reading* (look for, activity). In contrast, if the process is headed, *chac-ta* has *result state reading* (find, accomplishment). All these results are shown in the lexical structure of *chac-ta* in Figure 1.

Figure 1 Lexical structure of *chac-ta*

There are two subevents in *event structure* of *chac-ta* and two *true arguments* in *argument structure*. In *qualia structure*, the *agentive* role is *act of trying to find* and the *formal* role is the *search target's existential and locational cognition result*, which is not always guaranteed because the searching process may not be successful. Now we'll see the benefits of this analysis with some examples in (11).

- (11) a. *na-nun Seoul haying yelcha-lul chac -ko iss -ta.*  
 I-Top Seoul for train-ACC look for-PROG-DEC  
 "I am looking for a train for Seoul."  
 b. *na-nun Seoul haying yelcha-lul chac -ass -ta.*  
 I-Top Seoul for train-ACC seek/find-PAST-DEC  
 "I found/looked for a train for Seoul."  
 c. *na-nun Seoul haying yelcha-lul chac -nun -ta.*  
 I-Top Seoul for train-ACC look for-PRES-DEC  
 "I look for a train for Seoul."  
 d. *na-nun machimnay Seoul haying yelcha-lul chac-ass -ta.*  
 I-Top at last Seoul for train-ACC find-PAST-DEC  
 "At last I found for a train for Seoul."

- e. *na-nun Seoul haying yelcha-lul chac-a -nay-ess -ta.*  
 I-Top Seoul for train-ACC find out -PRES -DEC  
 “I found out a train for Seoul.”
- f. *na-nun Seoul haying yelcha-lul chac-a -po-ass -ta.*  
 I-Top Seoul for train-ACC look for try-PAST-DEC  
 “I tried to look for a train for Seoul.”

All sentences in (11) have the same verb *chac-ta*, which comes to have fixed meanings after *composition* process. First, a combination with suffixes is shown in (11a-c). Combined with *-ko iss-* or *-nun-*,<sup>4</sup> the event head of *chac-ta* is not given, that is, *headless*, and thus it has the *process reading of activity*. In contrast, in case of *-ass-*, the event head is posited on the *process* event and *chac-ta* has the *result state reading of accomplishment*. But, (11b) and (11c) are still ambiguous and underheaded even after *composition* is applied. It’s mainly because the suffixes *-ass-* and *-nun-* must be interpreted in contexts where there are no adverbs or adjuncts to combine with. (11d) shows a *composition* with adverbs to avoid this ambiguity. The adverb *machimnay* (at last) helps to place the event head of *chac-ta* on *process* event and this makes *chac-ta* an *accomplishment* verb in this case.

The examples in (11e) and (11f) show *composition* with auxiliaries *-nay-ta* and *-po-ta*. In the same way, the sense of *chac-ta* is determined by the *composition* process with the auxiliaries. To summarize, the sense of *chac-ta* relies on its *event structure*, especially the *headedness*. *Chac-ta* has two subevents with no headedness and the headedness is determined by *composition* process in the GL framework. However, for some ambiguous suffixes, relevant contexts are needed to determine the sense of *chac-ta*. The lexical structure of *chac-ta* supports this whole process. And it gives a rational way of explaining the aspectually dual verb *chac-ta*.

### 3. The *intensionality* issue of *chac-ta*

The verb *chac-ta* can have two kinds of objects: *existence* and *location* of the target. Also, there is a sequential order between two objects, that is, we usually look for the existence of something and then find the exact location of it. This is the reason we

---

<sup>4</sup> *chac-nun-ta* usually indicates the progressive, but it can indicate a perfective or completion when used in play scripts. Thus we suggest it is also ambiguous.

placed the *existence* prior to the *location* of the search target in the *formal* role of **chac-ta**.

However, at this point, **chac-ta** shows an interesting feature in its *intensionality* and *extensionality* issue. Consider the following examples of (12) first.

- (12) a. *Sue-nun cip han chay-lul ci -ess -ta.*  
 S-Top house one CL-ACC build-PAST-DEC  
 “Sue built a house.”
- b. *Sue-nun kapang-ul chac-ass -ta.*  
 S-Top bag-ACC find-PAST-DEC  
 “Sue found her bag.”
- c. *Sue-nun unicorn-ul chac-ass -ta.*  
 S-Top unicorn-ACC find-PAST-DEC  
 “Sue found a unicorn.”

The sentences (12a) and (12b) have objects that exist in the real world, in which **chac-ta** in (12b) has the *find* reading. It involves the existential presupposition of the object. However, there is no existential presupposition of *unicorn* in (12c) and it is a non-true sentence because a unicorn only exists in a possible imaginary world. In this sense, **chac-ta** and **cis-ta**, though they are classified as the same *accomplishment* verbs, are different in that **chac-ta** has an *intensionality* and an *extensionality* in a single verb at the same time.

### 3.1. Diagnostics of intensionality

To clarify it, we did a diagnostics of *intensional* verb shown in (13), which is introduced by Moltmann (1997).

- (13) a. lack of an existence entailment for the object.  
 b. failure of substitutivity of coreferential terms.  
 c. difference in the acceptability of personal vs. Impersonal pronouns.  
 d. conditions for the use of the phrase *the same person/thing*, where *thing* is felicitous only in intensional contexts (e.g. *Sam is looking for the same thing/\*person as Sue, namely a new assistant.*).

According to (13a), as you can see in (12c), **chac-ta** seems to be *intensional* because

*find* doesn't entail the existence of the object (*unicorn*). On the contrary, *kapang* in (12b) does exist and this fails to satisfy the condition (13a). In case of the condition (13b), we can't substitute the object *mapepsa* as a coreferential term *kukes* in (14a). This is why the subsequent sentence in (14a) is not well-formed grammatically. But, it's possible for the object *chinkwu* in (14b), which is contradictory to the condition (13b).

- (14) a. *na-nun mapepsa<sub>i</sub>-lul chac -ko iss -ta. ?\*kulena, kukes<sub>i</sub>-i swum-ess-ta.*  
 I-Top wizard-ACC look for-PROG-DEC but it-NOM hide-PAST-DEC  
 "I am looking for a wizard. ?\*But, it hid"
- b. *na-nun chinkwu<sub>i</sub>-lul chac -ko iss -ta. kulena, kui<sub>i</sub>-ka swum-ess-ta.*  
 I-Top friend-ACC look for-PROG-DEC but he-NOM hide-PAST-DEC  
 "I am looking for a friend. But, he hid."

The difference between (14a) and (14b) is that the speaker presupposes the existence of friend and looks for his location in (14b), while the speaker in (14a) looks for the existence of the wizard. Lastly, we have rather grammatical-oriented conditions of (13c) and (13d).

- (15) a. *Mary-nun mwues-inka-lul, cuk pise-lul chac -ko iss -ta.*  
 M-Top something-ACC i.e. secretary look for-PROG-DEC  
 "Mary is looking for something, i.e. a secretary."
- b. *?\*Mary-nun nwukwu-inka-lul, cuk pise-lul chac -ko iss -ta.*  
 M-Top some person-ACC i.e. secretary-ACC look for-PROG-DEC  
 "?\*Mary is looking for some person, i.e. a secretary."
- c. *Sue-nun Mia-ka chac-nun ttokkathun kes, cuk say pise-lul chac-ko iss-ta.*  
 S-Top M-NOM look for-REL same thing i.e. new secretary-ACC look for-PROG-DEC  
 "Sue is looking for the same thing as Mia, i.e. a new secretary."
- d. *?\*Sue-nun Mia-ka chac-nun ttokkathun saram, cuk say pise-lul chac-ko iss-ta.*  
 S-Top M-NOM look for-REL same person i.e. new secretary-ACC look for-PROG-DEC  
 "?\* Sue is looking for the same person as Mia, i.e. a new secretary."

The sentences in (15) show a typical characteristic of *intensional* verb. From all these results, we see that *chac-ta* has both *intensional* and *extensional* features. Then, what's the relationship between *intension* and *extension* in *chac-ta*?

### 3.2. Relationship between intension and extension

Let's start with the examples in (16).

- (16) a. *Kim-un (maum-ey tunun) sinpal-ul chac-a heymay-ko iss-ta.*  
K-Top satisfactory shoes-ACC look for-wander-PROG-DEC  
“Kim is wandering to look for (satisfactory) shoes.”
- b. *Kim-un sinpal-ul chac-a kipp-ess-ta.*  
K-Top shoes-ACC find-glad-PAST-DEC  
“Kim was glad to find his shoes.”

In both (16a) and (16b), we have the same object *sinpal*. But, whereas the shoes in (16a) are not specific, that is, all preferable alternatives are allowed, the shoes that *Kim* found in (16b) are very specific. In other words, we have an *intensional verb reading* in (16a), unlike the *extensional verb reading* in (16b). This is a typical example that shows alternation between *intension* and *extension* depending on its *reading*. In this view, Hallman (2000) regards the *de re* or specific reading of an indefinite object nominal of *look for* as outside the scope of the intensional verb, as in (17b).

- (17) a. Mia is looking for [a man that visited her recently].  
b. [a man that visited her recently] Mia is looking for *t*.

There have been several discussions about *intensional* verbs, since Montague (1974) analyzed *seek* as ‘*try to find*’ (Moltman 1997, Larson 2000, Zuber 2000, Hallman 2004). Here, we believe that we can explain the relationship between *intensionality* and *extensionality* by analyzing the lexical structure of *chac-ta*.

- (18) a. *na-nun paykma tan wangcanyim-ul chac -ko iss -ta.*  
I-Top white-horse-ridden prince-ACC look for-PROG-DEC  
“I am looking for a white-horse-ridden prince.”
- b. *na-nun ecey san ppalkan phen-ul chac -ko iss -ta.*  
I-Top yesterday buy read pencil-ACC look for-PROG-DEC  
“I am looking for a red pencil I bought yesterday.”

Since the object of *chac-ta* in (18a) doesn't exist in the real world, the speaker wants to know the existence of the prince when s/he speaks. In contrast, the speaker in (18b)

already knows the red pencil and wants to know where it is now, i.e. the focus of this question is the location of the red pencil. In deep sense, the two sentences entail a certain question: *exist?* or *where (whereabout)?*

Generally we premise an existence of a search target and seek it. Thus, *chac-ta* is *intensional* when we don't know the existence yet (*de dicto*; of the said). However, we have an *extension* of *chac-ta* with the temporal-spatial specificity (*de re*; of the thing), once the *uncertainty* of existence is resolved (Pelletier 1993, 1994). The *uncertainty* with alternative possibilities is the essence of *intensionality* and we assimilate it to non-veridicality that Montague (1974) discussed and Zwarts (1995) developed in connection with *strong and weak negative polarity*. We tentatively claim that *intensionality* is weakly equivalent to *non-veridicality*, which is for *weak negative polarity*.

### 3.3. Lexical Conceptual Paradigm of *chac-ta*

The duality of *chac-ta* is clearly understood by studying *mood* in French. In French, while the *indicative* describes objective facts, the *subjunctive* is a subjective expression indicating motion or state in mind. The *subjunctive* always appears in a subordinate clause and is dependent on the verbal meaning in the main clause. In general, the verbal meaning in the main clause is fixed and the selection of *mood* in subordinate clause follows it. However, *chercher* in French uniquely takes either the *indicative* or the *subjunctive* in relative clauses when the search target is modified by the relative. Consider:

- (19) a. Le metteur en scene *cherche* un home qui **a** une cicatrice sur la joue gauche.  
(the *indicative*)  
b. Le metteur en scene *cherche* un home qui **ait** une cicatrice sur la joue gauche.  
(the *subjunctive*)  
(a,b) “The director is looking for a man with a scar on his left cheek.”

While (19a) premises the existence of the man, (19b) doesn't presuppose his existence and looks for his existence at first. That is, the main concern in (19a) is his location, in contrast to both the existence and the location in (19b). In this sense, we can possibly represent the complements of *chac-ta* as in (20).

- (20)  $\alpha\_lcp = \{ \text{existence} \cdot \text{location}, \text{location}, * \text{existence} \}$

If we assume that the complement of *chac-ta*, ARG<sub>2</sub>, is  $\alpha$ , the *lexical conceptual paradigm* (lcp) of complement will be represented as a *dotted type* of existence and location. We take a *dotted type*, ‘existence·location’, among complement\_lcps because there is no assumption of complements when *chac-ta* is used as an *intensional* verb. On the other hand, when *chac-ta* is used as an *extensional* verb, we take only ‘location’ as complement\_lcp. But, we can’t take only ‘existence’ as complement\_lcp, since we come to know the location inevitably due to its selective feature, even though we don’t attend.

This study is more significant in that we apply the concept of *intensionality* and *extensionality* and suggest a new paradigm of complements, as well as analyze an aspectual meaning and lexical structure of *chac-ta*.

#### 4. Discussion and Conclusion

In this study, we explored *chac-ta* in Korean, especially for an aspectual nature of it. We claimed that *chac-ta* is a *complementary polysemy*, which is unique in Korean in contrast to French, English, and Japanese. When looking into the *event structure* of *chac-ta*, there are two subevents: process of ‘trying to find’ and result state of ‘find’ simultaneously. But, *chac-ta* is often ambiguous in various contexts because the event head is *underspecified* in its lexical structure. This ambiguity is resolved by *event headedness* in the framework of the *Generative Lexicon Theory* when it is composed with other arguments such as *suffixes*, *auxiliaries* or *adverbs*.

Therefore, we can say that *chac-ta* is a single *accomplishment* verb, which has two subevents. For the *process only reading*, we assume that *chac-ta* has *headless* feature and the *result state* is not realized. Therefore, it seems to be an *activity* verb. By contrast, for the *result state reading*, *chac-ta* seems to be a normal *accomplishment* verb, which has an event head on the *process*. In a way, when *chac-ta* is combined with tense markers ‘-ass-’ and ‘-nun-’, the *headedness* is mainly dependent on the context.

In many languages, unlike in Korean, *chac-ta* is realized as two distinct verbs according to the aspectual meaning. For example, French has two different verbs, *chercher* (process) and *trouver* (result state), and each verb has a different aspect. In Chinese, similar to Korean, *tsuo* ‘look for’ means *find* (result state) when it is combined with a resultative auxiliary *dao*, forming an accomplishment event, of which the past is marked with *le*. The past marking with *le* without *dao*, *tsuo le* just means the past of the process *look for*.

What is notable is that *chac-ta* has *intensional* and *extensional* feature at the same

time. By analyzing its lexical structure, we found that *chac-ta* has two kinds of objects: *existence* and *location* of the target. According to the object, *chac-ta* can be *intensional* or *extensional* verb. Also, we suggested a *lexical conceptual paradigm* of complement for *chac-ta* and assumed that *intensionality* is weakly equivalent to *non-veridicality*.

Although this study is not generalized *interlingually* or even *intralingually* in Korean yet, when considering the universality and diversity of languages, we can develop and further this paradigm of analysis for a similar phenomenon.

## Abstract

In this paper we explore the cognitive basis of new meanings development in English in the process of semantic change. The paper investigates how individual sense alterations that arise from deviations in the words use in a novel context are developing into a new meaning of a lexeme. We concentrate on the analysis of the conceptual structure of a word as the major factor imposing constraints on deviation and meaning variation. The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which are interconnected and form a kind of radial structure.

**Keywords:** conceptual structure, frame, pragmatic inference, semantics, new meaning.

## 1. Introduction

The paper focuses on the interrelation of language use with linguistic structure and underlying conceptual structure. We proceed from the assumption that new meaning development involves both cognitive and functional issues. In fact when any new meaning is formed we deal with three types of deviation: semantic ("sign - referent" relation), pragmatic ("sign - user" relation) and cognitive (relations between conceptual structures of original and new meanings). The first step in the development of a new meaning is the deviation in "sign - user" relation. The new meaning of a word appears as a result of instantaneous deviation in individual use in the new linguistic environment. The speaker invites the hearer to infer the new nuances of meaning. The hearer makes a cognitive effort to infer the new shades of meaning, which the word develops due to the unusual use. The individual pragmatic inference in the course of time becomes salient in the speaking community, it is shared and adapted by more than one speaker and becomes conventionalised (generalised) invited inference with strengthened pragmatic impact (Traugott and Dasher, 2002). And at a later stage generalized pragmatic inference is semanticised into a new coded meaning of a word.

In other words we try to analyse how novel individual pragmatic inferences, which present a kind of implicature, are developing into a new meaning of lexeme. The conceptual structure of a lexeme is represented by radial hierarchical structure consisting of several interconnected frames. We concentrate on the metonymical and metaphorical relations between the frames.

## 2. Analogy and relevance

Analogy is the principle in the transfer of information, which keeps the communication going through the continuity of reference (cf Zelinsky – Wibbelt,

2000:34; Beaugrande and Dressler, 1981:80; Boyd, 1993:505). By explaining the transfer of information in terms of the speaker's reasoning schemes we follow the scientific method of investigation as defined by Peirce's theory of signs (1934). In interpreting signs, speakers interrelate knowledge and language in a rule-governed and at the same time creative process. This process is intersubjective in that listeners decode the sign in the opposite direction from that which speakers take when encoding the sign. This intersubjective relationship supports Peirce's claim of the continuity of reference in the infinite interpretation of sense during the evolution of the word. Thereby the ubiquity of reasoning consists in intersubjectivising existing knowledge by striving for new interpretations (Zelinsky-Wibbelt, 2000). In interpreting signs speakers evaluate the signs extension iconically in a model. In accordance with Johnson-Laird's (1983) theory of mental models we think that speakers achieve their semantic representations in the following way. Proceeding from existing knowledge, the speakers build their propositional representations from what has been explicitly uttered. Based on the experience situation, speakers build analogous representations from which they can infer implicit information (Johnson-Laird, 1983:126f). What is essential for the cognition of analogy is hierarchy, which is based on hyponymy and meronymy. Hyponymy corresponds to the Is-A relationship in knowledge representation systems, which encodes the set inclusion between sub- and superclass. Meronymy corresponds to the Has-A relationship in knowledge representation systems which encodes the relations between wholes and parts (cf. Cruse, 1986:124). Following Zelinsky-Wibbelt (2003) we consider that within the hierarchy of humans knowledge hyponymy and meronymy establish an interface at the basic level of categorization. Within their hierarchical knowledge representation humans are also most capable of recognizing analogies at the basic level of categorization (not at subordinate or at superordinate levels).

How is adequate balance between processing existing knowledge and new information is achieved? The answer is the principle of relevance. Relevance theory postulates the general communicative ability by which listeners recognise the relevant information in a relevant context. The speakers strive at achieving maximal cognitive-pragmatic effect with minimal cognitive effort. (cf. Sperber&Wilson, 1995; Gutt 1991; Goatley, 1994; Zelinsky-Wibbelt, 2003)

In accessing new information humans create mental models by proceeding from existing knowledge. We follow the original schema theories as introduced by Barlett (1932) & Piaget (1972) as they are still valid in cognitive psychology. In accordance with Piaget and following Zelinsky-Wibbert (2003) we assume the individuals' active information processing, who integrate new information into their existing assimilating schemata, as long as there is no conflict between existing knowledge and newly encountered information. As soon as conflict arises the individual evaluates, whether the respective schema is accommodated in the new information. (cf Beaugrande, 1997:335f) This structural accommodation enables the emergence of new figurative concepts. (cf Zelinsky-Wibbert, 2003:28)

### 3. Pragmatic inference vs. cognitive inference

It is common knowledge that inference is a conclusion drawn from one or more assumptions. Abductive reasoning was introduced by Ch. Peirce as an empirically focused procedure for the construction of classes and categories from observed data. Abductive inference leads to testable hypotheses about the way things are. Data are correlated on the basis of their similarity or by analogy with some known system, usually with an eye to the apparent function or relevance with the emerging general description (Cruse, 2002).

We try to develop the widely recognized hypothesis about the pragmatics as the chief driving force in the processes of new meaning development. As pointed out by Bartsch 'semantic change is possible because the specific linguistic norm including semantic norms are hypothetical norms, subordinate to the highest norms of communication (the pragmatic aspect of change)' (Bartsch, 1998:393).

Being concerned with both cognitive and functional issues of a lexeme we draw on several strands of research including 1) cognitive studies of the structuring of semantic domain; 2) pragmatics, especially the pragmatics of the conventionalising of implicatures (we will call them invited inferences) that arise in language use (Geis, Zwicky, Grice, Brown & Levinson, Levinson 1995, 2000; Clark 1996); 3) discourse analysis conceived as the interaction of grammar and use (Hopper and Thompson, 1980).

The term *invited inference* is borrowed from Geis & Zwicky (1971) but we, following El. Traugott, understand invited inferences broader and do not restrict them to generalized implicatures. The speaker/writer evokes implicatures and invites the addressee to infer them. We prefer this term over 'context-induced inferences' (Heine, Claudi, Hunnemeyer, 1991). Since the latter term suggests a focus on induced inferences as interpreters and appears to downplay the active role of speaker/writer who is actually choreographing the communicative act (cf. Traugott and Dasher, 2002:16).

In thinking about meaning change and especially about invited inferences arising out of and being exploited in the flow of speech it is useful to build on Levinson (1995) and following Traugott and Dasher (2002) we distinguish three levels of meaning relevant to a lexeme:

- (i) CODED MEANINGS (SEMANTICS). This is a convention of a language at a given time.
- (ii) UTTERANCE-TOKEN MEANINGS. These are invited inferences (IINs) that have not been crystallized into commonly used implicatures. They arise in context 'on the fly'. They may be based in encyclopaedic knowledge, or on the situation at hand, in which case they are knowledge- or situation-specific.
- (iii) UTTERANCE-TYPE MEANINGS. These are generalized invited inferences (GIINs) which are crystallized invited inferences associated with certain lexemes or constructions that are specific to a linguistic community (Traugott and Dasher, 2002).

One of the tasks of pragmatics is to analyse the way the features of a wide pragmatic context are encoded on the level of system (cf. Levinson, 1983). In other words, pragmatics should study interconnection and interrelations between invited inferences, generalized invited inferences on the one hand and coded meaning on the other.

For the purpose of our analysis we suggest to introduce two types of inference: *pragmatic* inference and *semantic* one. We realise that there exist only one logical mechanism of inferencing but it can be implemented at two levels: pragmatic and semantic. Pragmatic inferencing can be viewed as the application of the general inferential mechanisms of the logic to a particular context for a specific goal. Semantic inference is the type of inference that is involved in the process of inheritance of information from the original coded meaning of a word into a new coded meaning of a word. It goes without saying that we can speak about the parallels between pragmatic/rhetoric inference and inference at the level of semantic structure.

These parallels can perhaps best be illustrated by examining the structure of *enthymemic inference* in rhetoric of Aristotle; that is, the conditions which license ellipsis in persuasive discourse. Inference is put to use for persuasive discourse, and that which is persuasive is evaluated only in reference to some specific individual (cf. Pustejovsky, 2001:236).

The semantic inference will be described in more detail in the next section during the analysis of the development of new meaning of some English adjectives.

#### **4. Cognitive-pragmatic basis of new meaning development in English adjectives**

In this section we will try to analyse the process of conventionalisation of pragmatic inferences and their semantisation into a new meaning of a lexeme. We will also try to analyse the changes in the conceptual structure of English adjectives as a major factor imposing constraints in the meaning and deviation.

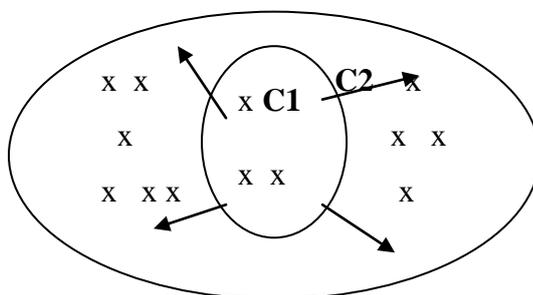

In the process of communication the speaker as if invites the hearer to perform the operation of inferencing of new nuances of meaning that arise as a result of novel use of traditional word in new non-typical context. The overall process of conventionalisation of pragmatic inference and their later semantisation as new coded meanings of a lexeme has been investigated thoroughly by E. Traugott (1999:96). She introduces a model of the mechanism by which innovations may arise in the individual and later be propagated or spread through the community.

Most studies of semantic change focus on the relationship between the original and the new coded meaning. The aim of such semantic analysis is to define the type of semantic change (narrowing, widening, metaphor, metonymy, pejoration, ameliation, enantiosemy). The studies of the role of pragmatic inferencing in semantic change are deficient.

The meaning M1 of a lexeme L is linked to a conceptual structure C1 of the original meaning. Meaning M1 represents any meaning that gives rise to invited inferencing. Speaker/writer exploits individual invited inferences innovatively in associative stream of speech (UTTERANCE-TOKEN meaning). For individual invited inference to be semanticised as a new coded meaning the innovation must be spread through the community. If speaker/writer innovates and addressee/receiver replicates this innovation they do so in the role of sp/ws, i.e. as language producers, not as language perceivers (Traugott and Dasher, 2002:38). In the course of time the traditional invited inference becomes conventionalised as GIINs (generalized invited inferences). Later GIINs are semanticised as a new coded meaning M2 with a new conceptual structure C2 of a lexeme L.

Let's consider the development of the new coded meaning of the word 'aggressive'. How did 'aggressive' turned into a good thing? Job advertisements show employers desperate to find 'aggressive' approaches and practise 'aggressive' strategies. In 1908, unhappy with Freud's emphasis on sex, his disciple Alfred Adler developed the idea of Aggressionstrieb, the 'aggression drive'. He meant self-assertion and desire to achieve. It was in Canada that their precise modern usage first surfaced, as a synonym for 'enterprising' or 'energetic'. In 1930, an advertisement in a Vancouver newspaper asked for an 'aggressive clothing salesman'. In 1956, a similar ad in Winnipeg suggested that 'only aggressive men need apply' (Morrish, 1999). It took 40 years for the new pragmatic inference to be conventionalised and generalised to be recorded in the dictionary as a new coded meaning with its own conceptual structure.

At this stage of our analysis we would like to concentrate on closer interconnection between *pragmatic* and *cognitive* inferencing. We will try to analyse the mechanism of the cognitive inferencing taking place between the conceptual structure of the original meaning and the new one (M1(C1) → M2(C2)). From the point of view of cognitive structure we can speak about ad hoc concepts, which can appear via narrowing or widening. The mechanisms of metaphorical and metonymical transforms has been explored profoundly for the past few years but the mechanisms of conceptual narrowing and widening have not been given proper attention. Let me start with the analysis of the process of conceptual widening (generalization). Schematically it can be represented in the following way.

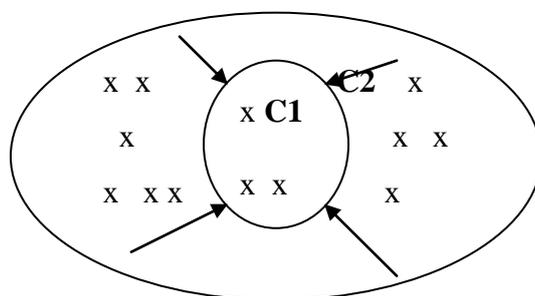

The extensional of the meaning is widened. i.e. the word comes to denote greater number of referential qualities while the intentional is becoming poorer cf. in logics – the wider the scope of notion, the poorer is the content.

Let's take the above mentioned word 'aggressive'. The original meaning of 'aggressive' - 'disposed to attack others', from the noun 'aggression' – a military term first found in the seventeenth century and meaning 'an unprovoked attack'. Both come from the Medieval Latin verb *aggressare*, meaning 'to launch such an action'.

If we compare the original meaning with the new one 'enterprising, energetic' we cannot fail to see that the conceptual feature *military* has disappeared. The process of generalization has taken place.

The extensional of the M1 has been widened. At the same time the positive component has been added to the original meaning. The process of enantiosemey has taken place (the change of the emotive charge into the opposite).

The opposite process of conceptual narrowing can be represented by the following scheme:

The extensional of the concept becomes narrower and the word comes to denote fewer number of references, the intentional is enriched.

This process can be illustrated by the development of new meaning of a word “adult” which presents a euphemism for ‘pornographic’ or ‘salacious’. The major exception to this rule is ‘adult education’ which has never been remotely sexy. The first deviation (individual invited inference) suggesting salacious character of the word ‘adult’ was recorded in 1958 in the classifieds of *the New Musical Express*. Unusual ‘adult photo sets’ appeared a ‘free exciting offer’. For a while the word was used with inverted commas whenever the sexual implication was intended. Now they are going and if you open any dictionary of modern English you will find ‘full-grown’ as first definition of the word ‘adult’ and ‘pornographic’ as its second. So the original meaning of ‘adult’ dates back to the seventeenth century. It was formed from the Latin word *adolescere* meaning ‘to grow’. Originally ‘adult’ referred to ‘physical maturity’. Only in the twentieth century it came to imply ‘mature attitudes’ or ‘grown-up subject matter’. What happened as a result of semantisation of the invited inference connected with the word ‘adult’ is a new coded meaning with narrower extensional. As it is known from logics the narrower is the scope of concept the richer is the content of it. So the conceptual structure of new coded meaning C2 has been enriched by the component ‘salacious’ and the negative emotive charge. In this case the narrowing of concept is accompanied by the process of pejoration. As it is known the main characteristics of euphemism is the concept of vagueness and it is achieved by the use of hyperonym instead of hyponym. The main formula of euphemistic concept is: general-for-specific. A more general term ‘adult’ is used to name one of the qualities, which is normally associated with the activities of adult people. In fact we can speak here about inference based on metonymy.

So whenever a new euphemistic meaning is developed we deal with the process of narrowing of concept accompanied by the process of pejoration. The paradox of euphemisms consists in the fact that when a new form catches up with a negative content denoted by the word under taboo, the euphemism loses its vagueness and becomes a direct name of unpleasant thing. Then a new linguistic form is needed to cover or soften the negative essence of the thing meant. A new conceptual narrowing is taking place. Similar narrowing of concept took place in the development of new meaning of the word ‘cheesy’, which is defined in American dictionaries as ‘shoddy’, ‘insubstantial’ and ‘cheap’. In early and mid-nineteenth-century Britain ‘the cheese’

meant 'the very best' or 'the right thing'. It comes for the Urdu or Persian *chiz*, meaning 'thing'. Hence, 'the real *chiz*' and then 'the real cheese'. From this, too, comes 'The Big Cheese' and 'The Cheese', a 100-year-old expression that lives on (Morrish, 2002). But as early as 1896 the first negative use of the word 'cheesy' - a vague term of depreciation - was recorded in the USA. That is the time when the first negative pragmatic inference took place. It took a century for the individual invited inference to become generalized invited inference. In 1951 W.H.Auden used the word 'cheesy' in its new meaning in his well-known poem. But the actual semantisation of this pragmatic inference took place in the 1980s when the word became a buzz word on the US campuses where the fragrant comestible had long been associated with all manner of bodily functions and by-products (Morrish, 2001:33). In the 21<sup>st</sup> century this negative concept of 'cheese' has been extended to the term of abuse. So the process of narrowing has been accompanied by the process of enantiosemy.

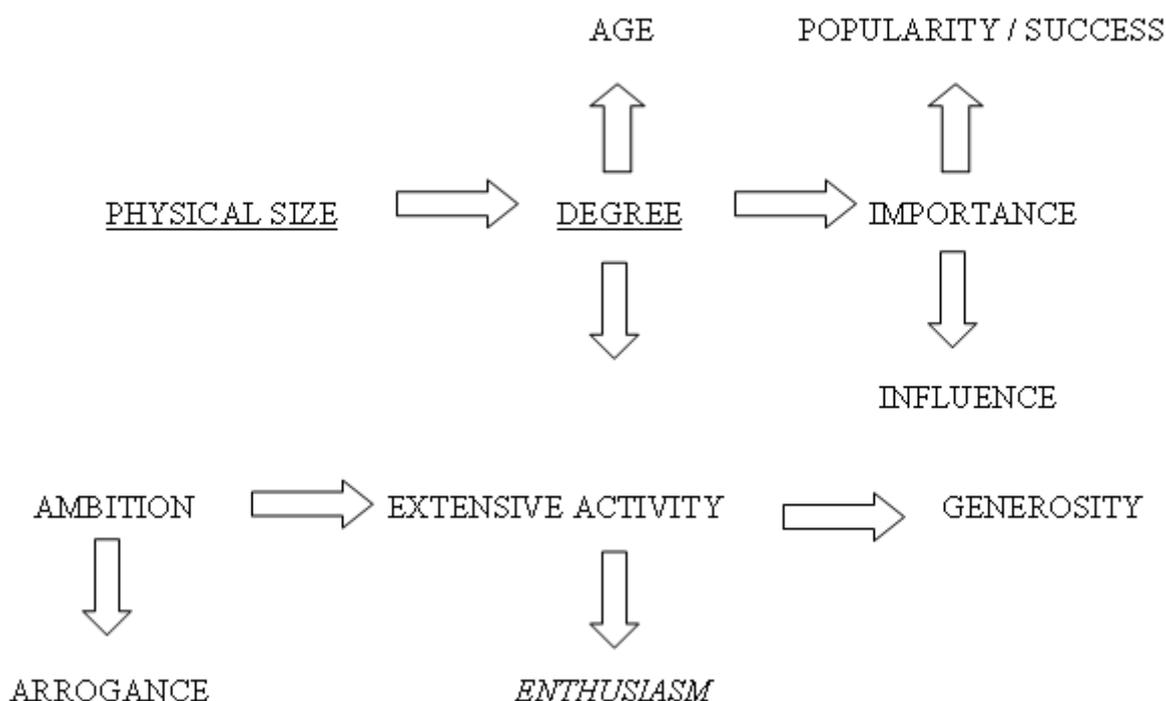

## **5. The analysis of changes in the conceptual structure of adjective big.**

Linguistic items map on to a number of concepts in the cognitive network. This network is built up by conceptual domains, which represent any kind of complex cognitive structure. Two types of domains are distinguished in cognitive linguistics. Content domains involve meaning proper, while schematic domains provide the conceptual representations for specific configurative frames. Both these domains mirror our perception of the world and both are conceptual in nature. In addition to these domains, there is an operating system consisting of different modes of construal which are imposed on the domains. They are not domains, but ways of structuring domains. They reflect basic cognitive abilities subsumed under five headings: specificity, background, perspective, scope and prominence. A linguistic expression typically invokes multiple domains, which characterize various aspects of the profiled entity or relation. Semantic contrast is due to the actual domains invoked in a particular expression and to the ranking of prominence among the domains (Langacker 1987: 57, e.g. *roe and caviar, come and go, half empty and half full, explode and explosion, tree and eucalyptus*). In the generative approach to lexical semantics, the domains are accounted for by levels of representation. Lexical inheritance is concerned with word meanings in relation to other word meanings in taxonomic hierarchies, and qualias specify various types of background knowledge associated with word meanings, such as purpose, function and mode of creation.

Adjectives are content words and as such the content domain is in the foreground. But adjectives are also configured according to the schematic domain. The property of gradability belongs in the schematic domain. It forms the conceptual basis for suitable modes of construal to become operative on the content part of lexical elements. Boundedness is a high-level schematic domain mode, which is abstract in the sense that it configures a wide range of different content domains, but at the same time it is highly concrete in that it is associated with basic experience of countability, aspectuality and gradability. Aspects based on content domains of various kinds have received attention in the linguistic literature (Warren 1992, Taylor 1996). But the configurational aspects have been put at a disadvantage in semantic theorizing in general and in the light of lexical interpretability, flexibility, indeterminacy and change in particular.

The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which are interconnected and form a kind of radial structure. Let's examine the conceptual structure of "Big" represented in Figure 1.

### Radial conceptual structure of adjective "Big"<sup>1</sup>

**Figure 1**

The prototypical meaning of *big* is of "considerable size or extent".

When we come across the phrases: *big cuts in staff*, or *big hazel eyes* the frame of size is evoked in the speaker's mind.

Closely related DEGREE frame of *big* which can also be regarded as prototypical.

(1) There could soon be a *big* increase in unemployment.

Another extension from the prototypical meaning of *big* may be the IMPORTANCE frame.

(2) He is a *big* noise in the organization.

The frames of SIZE, DEGREE and IMPORTANCE are connected by metaphorical projection (something of a considerable size or degree is important).

The IMPORTANCE frame has been extended to the frame of INFLUENCE. The conceptual domain of SIZE is directly mapped onto the conceptual domain of IMPORTANCE. The IMPORTANCE frame is also extended by the way of metonymical projection to the POPULARITY/SUCCESS frame.

(3) A lot of *big* names showed up at the gallery opening.

<sup>1</sup> Some elements of the scheme are borrowed from MIKOŁAJSKI (MIKOŁAJSKI 2007: 36)

For the past few years a number of new meanings have been added to the existing ones which correlate with new frames in the conceptual structure of *big*. In the 1970s a new meaning appeared “to be enthusiastic about smth, be a great fan or admirer of”.

(4) That company is *big* on research.

(5) I am very *big* on Goldwater (Nelson Rockefeller has been saying). We have been good friends over the years with a few unfortunate hiatuses. (National Review. 5/23/75 p. 544) cp.

(6) She said, I have just been at Macy’s. I have been going to Macy’s every day for the last two weeks. I am very *big* on Macy’s (New Yorker 5/16/77 p. 86 (1968)).

This new meaning is embedded into the frame of ENTHUSIASM which is closely connected with the frame of GENEROSITY (normally accompanied by frame of IRONY):

(7) I’m inclined to take pity on you. That’s *big* of you!

(8) A whole 5 pound! That was very *big* of her, I must say!

The two new frames represent a subordinate level of hierarchical structure of the macroframe of adjective *big*. The frames of EXTENSIVE ACTIVITY, AMBITION and ARROGANCE belong to the same subordinate level in the structure of the adjective. They are closely interconnected by way of metaphorical and metonymical projection and they overlap.

The frame of ARROGANCE is a relatively new emergent structure.

(9) George is such a show-off. He likes acting *big* sometime.

When a word is used in a discourse a particular frame of its conceptual structure is activated.

## 6. Conclusion

In the present paper we tried to explore the conceptual basis of semantic changes in present day English. We build on the interplay between creativity and conventionality in the process of new meaning creation. We tried to show that the new meaning of a word originates from the creative non-typical novel use of a traditional word in a non-typical linguistic environment. Three types of deviation have been analysed: pragmatic, semantic and cognitive. For the pragmatic invited inference to become semanticised as a new coded meaning it has to go through the process of conventionalisation, which normally lasts from twenty to one hundred years.

It was essential for the purposes of our analysis to distinguish between two types of linguistic inferences: pragmatic and cognitive. The former has to do with a context of a situation; the latter – with the changes in the conceptual structures of the original and new coded meanings. We tried to shed some light on the process of concept-narrowing and concept extension underlying the mechanisms of semantic changes. So the paper illustrates how inference actually becomes new reference as a result of intricate interplay between creativity and conventionality. Inference is always creative, reference is always conventional. We have tried to show that the conceptual structure of a polysemantic word is the major factor imposing constraints on deviation and meaning variation. The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which form a kind of radial structure. The

frames are interconnected with each other by way of metonymical and metaphorical projection as well as by extension through conceptual widening and narrowing.

## Abstract

In this paper we explore the cognitive basis of new meanings development in English in the process of semantic change. The paper investigates how individual sense alterations that arise from deviations in the words use in a novel context are developing into a new meaning of a lexeme. We concentrate on the analysis of the conceptual structure of a word as the major factor imposing constraints on deviation and meaning variation. The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which are interconnected and form a kind of radial structure.

**Keywords:** conceptual structure, frame, pragmatic inference, semantics, new meaning.

## 1. Introduction

The paper focuses on the interrelation of language use with linguistic structure and underlying conceptual structure. We proceed from the assumption that new meaning development involves both cognitive and functional issues. In fact when any new meaning is formed we deal with three types of deviation: semantic ("sign - referent" relation), pragmatic ("sign - user" relation) and cognitive (relations between conceptual structures of original and new meanings). The first step in the development of a new meaning is the deviation in "sign - user" relation. The new meaning of a word appears as a result of instantaneous deviation in individual use in the new linguistic environment. The speaker invites the hearer to infer the new nuances of meaning. The hearer makes a cognitive effort to infer the new shades of meaning, which the word develops due to the unusual use. The individual pragmatic inference in the course of time becomes salient in the speaking community, it is shared and adapted by more than one speaker and becomes conventionalised (generalised) invited inference with strengthened pragmatic impact (Traugott and Dasher, 2002). And at a later stage generalized pragmatic inference is semanticised into a new coded meaning of a word.

In other words we try to analyse how novel individual pragmatic inferences, which present a kind of implicature, are developing into a new meaning of lexeme. The conceptual structure of a lexeme is represented by radial hierarchical structure consisting of several interconnected frames. We concentrate on the metonymical and metaphorical relations between the frames.

## 2. Analogy and relevance

Analogy is the principle in the transfer of information, which keeps the communication going through the continuity of reference (cf Zelinsky – Wibbelt,

2000:34; Beaugrande and Dressler, 1981:80; Boyd, 1993:505). By explaining the transfer of information in terms of the speaker's reasoning schemes we follow the scientific method of investigation as defined by Peirce's theory of signs (1934). In interpreting signs, speakers interrelate knowledge and language in a rule-governed and at the same time creative process. This process is intersubjective in that listeners decode the sign in the opposite direction from that which speakers take when encoding the sign. This intersubjective relationship supports Peirce's claim of the continuity of reference in the infinite interpretation of sense during the evolution of the word. Thereby the ubiquity of reasoning consists in intersubjectivising existing knowledge by striving for new interpretations (Zelinsky-Wibbelt, 2000). In interpreting signs speakers evaluate the signs extension iconically in a model. In accordance with Johnson-Laird's (1983) theory of mental models we think that speakers achieve their semantic representations in the following way. Proceeding from existing knowledge, the speakers build their propositional representations from what has been explicitly uttered. Based on the experience situation, speakers build analogous representations from which they can infer implicit information (Johnson-Laird, 1983:126f). What is essential for the cognition of analogy is hierarchy, which is based on hyponymy and meronymy. Hyponymy corresponds to the Is-A relationship in knowledge representation systems, which encodes the set inclusion between sub- and superclass. Meronymy corresponds to the Has-A relationship in knowledge representation systems which encodes the relations between wholes and parts (cf. Cruse, 1986:124). Following Zelinsky-Wibbelt (2003) we consider that within the hierarchy of humans knowledge hyponymy and meronymy establish an interface at the basic level of categorization. Within their hierarchical knowledge representation humans are also most capable of recognizing analogies at the basic level of categorization (not at subordinate or at superordinate levels).

How is adequate balance between processing existing knowledge and new information is achieved? The answer is the principle of relevance. Relevance theory postulates the general communicative ability by which listeners recognise the relevant information in a relevant context. The speakers strive at achieving maximal cognitive-pragmatic effect with minimal cognitive effort. (cf. Sperber&Wilson, 1995; Gutt 1991; Goatley, 1994; Zelinsky-Wibbelt, 2003)

In accessing new information humans create mental models by proceeding from existing knowledge. We follow the original schema theories as introduced by Barlett (1932) & Piaget (1972) as they are still valid in cognitive psychology. In accordance with Piaget and following Zelinsky-Wibbert (2003) we assume the individuals' active information processing, who integrate new information into their existing assimilating schemata, as long as there is no conflict between existing knowledge and newly encountered information. As soon as conflict arises the individual evaluates, whether the respective schema is accommodated in the new information. (cf Beaugrande, 1997:335f) This structural accommodation enables the emergence of new figurative concepts. (cf Zelinsky-Wibbert, 2003:28)

### 3. Pragmatic inference vs. cognitive inference

It is common knowledge that inference is a conclusion drawn from one or more assumptions. Abductive reasoning was introduced by Ch. Peirce as an empirically focused procedure for the construction of classes and categories from observed data. Abductive inference leads to testable hypotheses about the way things are. Data are correlated on the basis of their similarity or by analogy with some known system, usually with an eye to the apparent function or relevance with the emerging general description (Cruse, 2002).

We try to develop the widely recognized hypothesis about the pragmatics as the chief driving force in the processes of new meaning development. As pointed out by Bartsch 'semantic change is possible because the specific linguistic norm including semantic norms are hypothetical norms, subordinate to the highest norms of communication (the pragmatic aspect of change)' (Bartsch, 1998:393).

Being concerned with both cognitive and functional issues of a lexeme we draw on several strands of research including 1) cognitive studies of the structuring of semantic domain; 2) pragmatics, especially the pragmatics of the conventionalising of implicatures (we will call them invited inferences) that arise in language use (Geis, Zwicky, Grice, Brown & Levinson, Levinson 1995, 2000; Clark 1996); 3) discourse analysis conceived as the interaction of grammar and use (Hopper and Thompson, 1980).

The term *invited inference* is borrowed from Geis & Zwicky (1971) but we, following El. Traugott, understand invited inferences broader and do not restrict them to generalized implicatures. The speaker/writer evokes implicatures and invites the addressee to infer them. We prefer this term over 'context-induced inferences' (Heine, Claudi, Hunnemeyer, 1991). Since the latter term suggests a focus on induced inferences as interpreters and appears to downplay the active role of speaker/writer who is actually choreographing the communicative act (cf. Traugott and Dasher, 2002:16).

In thinking about meaning change and especially about invited inferences arising out of and being exploited in the flow of speech it is useful to build on Levinson (1995) and following Traugott and Dasher (2002) we distinguish three levels of meaning relevant to a lexeme:

- (i) CODED MEANINGS (SEMANTICS). This is a convention of a language at a given time.
- (ii) UTTERANCE-TOKEN MEANINGS. These are invited inferences (IINs) that have not been crystallized into commonly used implicatures. They arise in context 'on the fly'. They may be based in encyclopaedic knowledge, or on the situation at hand, in which case they are knowledge- or situation-specific.
- (iii) UTTERANCE-TYPE MEANINGS. These are generalized invited inferences (GIINs) which are crystallized invited inferences associated with certain lexemes or constructions that are specific to a linguistic community (Traugott and Dasher, 2002).

One of the tasks of pragmatics is to analyse the way the features of a wide pragmatic context are encoded on the level of system (cf. Levinson, 1983). In other words, pragmatics should study interconnection and interrelations between invited inferences, generalized invited inferences on the one hand and coded meaning on the other.

For the purpose of our analysis we suggest to introduce two types of inference: *pragmatic* inference and *semantic* one. We realise that there exist only one logical mechanism of inferencing but it can be implemented at two levels: pragmatic and semantic. Pragmatic inferencing can be viewed as the application of the general inferential mechanisms of the logic to a particular context for a specific goal. Semantic inference is the type of inference that is involved in the process of inheritance of information from the original coded meaning of a word into a new coded meaning of a word. It goes without saying that we can speak about the parallels between pragmatic/rhetoric inference and inference at the level of semantic structure.

These parallels can perhaps best be illustrated by examining the structure of *enthymemic inference* in rhetoric of Aristotle; that is, the conditions which license ellipsis in persuasive discourse. Inference is put to use for persuasive discourse, and that which is persuasive is evaluated only in reference to some specific individual (cf. Pustejovsky, 2001:236).

The semantic inference will be described in more detail in the next section during the analysis of the development of new meaning of some English adjectives.

#### **4. Cognitive-pragmatic basis of new meaning development in English adjectives**

In this section we will try to analyse the process of conventionalisation of pragmatic inferences and their semantisation into a new meaning of a lexeme. We will also try to analyse the changes in the conceptual structure of English adjectives as a major factor imposing constraints in the meaning and deviation.

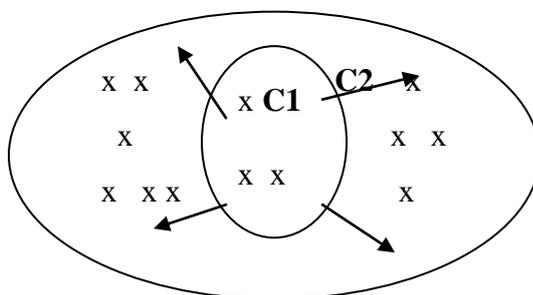

In the process of communication the speaker as if invites the hearer to perform the operation of inferencing of new nuances of meaning that arise as a result of novel use of traditional word in new non-typical context. The overall process of conventionalisation of pragmatic inference and their later semantisation as new coded meanings of a lexeme has been investigated thoroughly by E. Traugott (1999:96). She introduces a model of the mechanism by which innovations may arise in the individual and later be propagated or spread through the community.

Most studies of semantic change focus on the relationship between the original and the new coded meaning. The aim of such semantic analysis is to define the type of semantic change (narrowing, widening, metaphor, metonymy, pejoration, ameliation, enantiosemy). The studies of the role of pragmatic inferencing in semantic change are deficient.

The meaning M1 of a lexeme L is linked to a conceptual structure C1 of the original meaning. Meaning M1 represents any meaning that gives rise to invited inferencing. Speaker/writer exploits individual invited inferences innovatively in associative stream of speech (UTTERANCE-TOKEN meaning). For individual invited inference to be semanticised as a new coded meaning the innovation must be spread through the community. If speaker/writer innovates and addressee/receiver replicates this innovation they do so in the role of sp/ws, i.e. as language producers, not as language perceivers (Traugott and Dasher, 2002:38). In the course of time the traditional invited inference becomes conventionalised as GIINs (generalized invited inferences). Later GIINs are semanticised as a new coded meaning M2 with a new conceptual structure C2 of a lexeme L.

Let's consider the development of the new coded meaning of the word 'aggressive'. How did 'aggressive' turned into a good thing? Job advertisements show employers desperate to find 'aggressive' approaches and practise 'aggressive' strategies. In 1908, unhappy with Freud's emphasis on sex, his disciple Alfred Adler developed the idea of Aggressionstrieb, the 'aggression drive'. He meant self-assertion and desire to achieve. It was in Canada that their precise modern usage first surfaced, as a synonym for 'enterprising' or 'energetic'. In 1930, an advertisement in a Vancouver newspaper asked for an 'aggressive clothing salesman'. In 1956, a similar ad in Winnipeg suggested that 'only aggressive men need apply' (Morrish, 1999). It took 40 years for the new pragmatic inference to be conventionalised and generalised to be recorded in the dictionary as a new coded meaning with its own conceptual structure.

At this stage of our analysis we would like to concentrate on closer interconnection between *pragmatic* and *cognitive* inferencing. We will try to analyse the mechanism of the cognitive inferencing taking place between the conceptual structure of the original meaning and the new one (M1(C1) → M2(C2)). From the point of view of cognitive structure we can speak about ad hoc concepts, which can appear via narrowing or widening. The mechanisms of metaphorical and metonymical transforms has been explored profoundly for the past few years but the mechanisms of conceptual narrowing and widening have not been given proper attention. Let me start with the analysis of the process of conceptual widening (generalization). Schematically it can be represented in the following way.

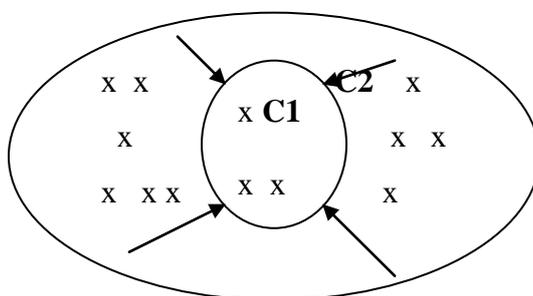

The extensional of the meaning is widened. i.e. the word comes to denote greater number of referential qualities while the intentional is becoming poorer cf. in logics – the wider the scope of notion, the poorer is the content.

Let's take the above mentioned word 'aggressive'. The original meaning of 'aggressive' - 'disposed to attack others', from the noun 'aggression' – a military term first found in the seventeenth century and meaning 'an unprovoked attack'. Both come from the Medieval Latin verb *aggressare*, meaning 'to launch such an action'.

If we compare the original meaning with the new one 'enterprising, energetic' we cannot fail to see that the conceptual feature *military* has disappeared. The process of generalization has taken place.

The extensional of the M1 has been widened. At the same time the positive component has been added to the original meaning. The process of enantiosemia has taken place (the change of the emotive charge into the opposite).

The opposite process of conceptual narrowing can be represented by the following scheme:

The extensional of the concept becomes narrower and the word comes to denote fewer number of references, the intentional is enriched.

This process can be illustrated by the development of new meaning of a word “adult” which presents a euphemism for ‘pornographic’ or ‘salacious’. The major exception to this rule is ‘adult education’ which has never been remotely sexy. The first deviation (individual invited inference) suggesting salacious character of the word ‘adult’ was recorded in 1958 in the classifieds of *the New Musical Express*. Unusual ‘adult photo sets’ appeared a ‘free exciting offer’. For a while the word was used with inverted commas whenever the sexual implication was intended. Now they are going and if you open any dictionary of modern English you will find ‘full-grown’ as first definition of the word ‘adult’ and ‘pornographic’ as its second. So the original meaning of ‘adult’ dates back to the seventeenth century. It was formed from the Latin word *adolescere* meaning ‘to grow’. Originally ‘adult’ referred to ‘physical maturity’. Only in the twentieth century it came to imply ‘mature attitudes’ or ‘grown-up subject matter’. What happened as a result of semantisation of the invited inference connected with the word ‘adult’ is a new coded meaning with narrower extensional. As it is known from logics the narrower is the scope of concept the richer is the content of it. So the conceptual structure of new coded meaning C2 has been enriched by the component ‘salacious’ and the negative emotive charge. In this case the narrowing of concept is accompanied by the process of pejoration. As it is known the main characteristics of euphemism is the concept of vagueness and it is achieved by the use of hyperonym instead of hyponym. The main formula of euphemistic concept is: general-for-specific. A more general term ‘adult’ is used to name one of the qualities, which is normally associated with the activities of adult people. In fact we can speak here about inference based on metonymy.

So whenever a new euphemistic meaning is developed we deal with the process of narrowing of concept accompanied by the process of pejoration. The paradox of euphemisms consists in the fact that when a new form catches up with a negative content denoted by the word under taboo, the euphemism loses its vagueness and becomes a direct name of unpleasant thing. Then a new linguistic form is needed to cover or soften the negative essence of the thing meant. A new conceptual narrowing is taking place. Similar narrowing of concept took place in the development of new meaning of the word ‘cheesy’, which is defined in American dictionaries as ‘shoddy’, ‘insubstantial’ and ‘cheap’. In early and mid-nineteenth-century Britain ‘the cheese’

meant 'the very best' or 'the right thing'. It comes for the Urdu or Persian *chiz*, meaning 'thing'. Hence, 'the real *chiz*' and then 'the real cheese'. From this, too, comes 'The Big Cheese' and 'The Cheese', a 100-year-old expression that lives on (Morrish, 2002). But as early as 1896 the first negative use of the word 'cheesy' - a vague term of depreciation - was recorded in the USA. That is the time when the first negative pragmatic inference took place. It took a century for the individual invited inference to become generalized invited inference. In 1951 W.H.Auden used the word 'cheesy' in its new meaning in his well-known poem. But the actual semantisation of this pragmatic inference took place in the 1980s when the word became a buzz word on the US campuses where the fragrant comestible had long been associated with all manner of bodily functions and by-products (Morrish, 2001:33). In the 21<sup>st</sup> century this negative concept of 'cheese' has been extended to the term of abuse. So the process of narrowing has been accompanied by the process of enantiosemy.

## **5. The analysis of changes in the conceptual structure of adjective big.**

Linguistic items map on to a number of concepts in the cognitive network. This network is built up by conceptual domains, which represent any kind of complex cognitive structure. Two types of domains are distinguished in cognitive linguistics. Content domains involve meaning proper, while schematic domains provide the conceptual representations for specific configurative frames. Both these domains mirror our perception of the world and both are conceptual in nature. In addition to these domains, there is an operating system consisting of different modes of construal which are imposed on the domains. They are not domains, but ways of structuring domains. They reflect basic cognitive abilities subsumed under five headings: specificity, background, perspective, scope and prominence. A linguistic expression typically invokes multiple domains, which characterize various aspects of the profiled entity or relation. Semantic contrast is due to the actual domains invoked in a particular expression and to the ranking of prominence among the domains (Langacker 1987: 57, e.g. *roe and caviar, come and go, half empty and half full, explode and explosion, tree and eucalyptus*). In the generative approach to lexical semantics, the domains are accounted for by levels of representation. Lexical inheritance is concerned with word meanings in relation to other word meanings in taxonomic hierarchies, and qualias specify various types of background knowledge associated with word meanings, such as purpose, function and mode of creation.

Adjectives are content words and as such the content domain is in the foreground. But adjectives are also configured according to the schematic domain. The property of gradability belongs in the schematic domain. It forms the conceptual basis for suitable modes of construal to become operative on the content part of lexical elements. Boundedness is a high-level schematic domain mode, which is abstract in the sense that it configures a wide range of different content domains, but at the same time it is highly concrete in that it is associated with basic experience of countability, aspectuality and gradability. Aspects based on content domains of various kinds have received attention in the linguistic literature (Warren 1992, Taylor 1996). But the configurational aspects have been put at a disadvantage in semantic theorizing in general and in the light of lexical interpretability, flexibility, indeterminacy and change in particular.

The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which are interconnected and form a kind of radial structure. Let's examine the conceptual structure of "Big" represented in Figure 1.

### Radial conceptual structure of adjective "Big"<sup>1</sup>

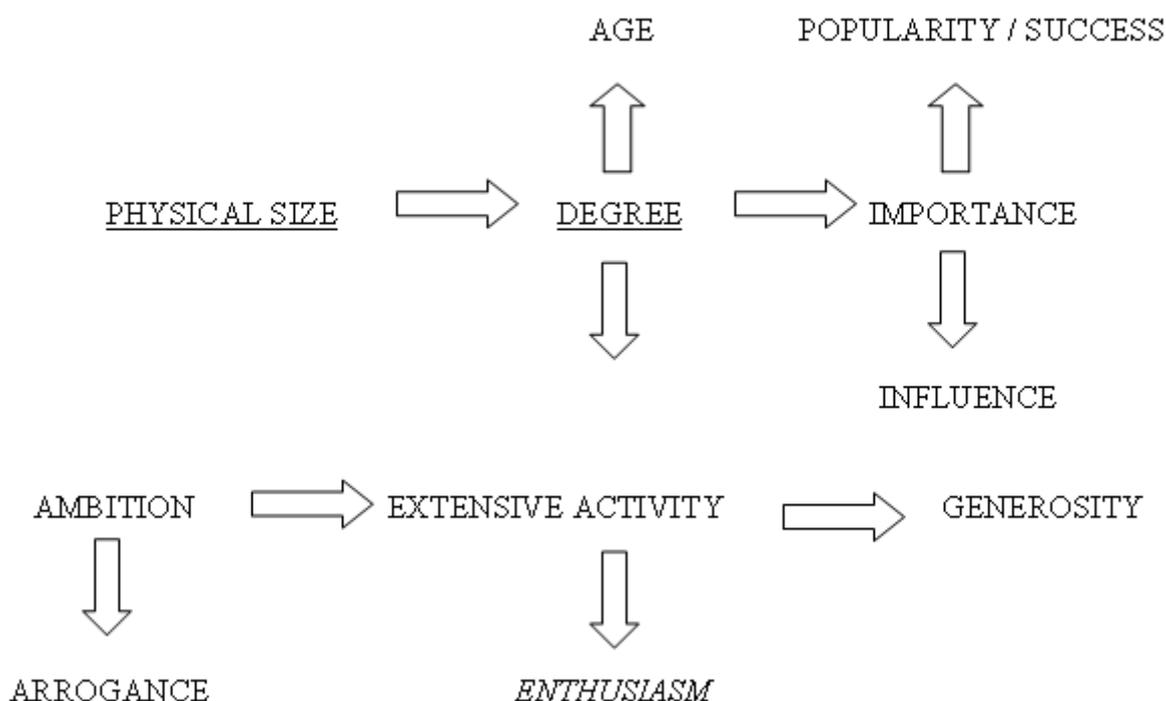

Figure 1

The prototypical meaning of *big* is of "considerable size or extent".

When we come across the phrases: *big cuts in staff*, or *big hazel eyes* the frame of size is evoked in the speaker's mind.

Closely related DEGREE frame of *big* which can also be regarded as prototypical.

(1) There could soon be a *big* increase in unemployment.

Another extension from the prototypical meaning of *big* may be the IMPORTANCE frame.

(2) He is a *big* noise in the organization.

The frames of SIZE, DEGREE and IMPORTANCE are connected by metaphorical projection (something of a considerable size or degree is important).

The IMPORTANCE frame has been extended to the frame of INFLUENCE. The conceptual domain of SIZE is directly mapped onto the conceptual domain of IMPORTANCE. The IMPORTANCE frame is also extended by the way of metonymical projection to the POPULARITY/SUCCESS frame.

(3) A lot of *big* names showed up at the gallery opening.

<sup>1</sup> Some elements of the scheme are borrowed from MIKOŁAJSKI (MIKOŁAJSKI 2007: 36)

For the past few years a number of new meanings have been added to the existing ones which correlate with new frames in the conceptual structure of *big*. In the 1970s a new meaning appeared “to be enthusiastic about smth, be a great fan or admirer of”.

(4) That company is *big* on research.

(5) I am very *big* on Goldwater (Nelson Rockefeller has been saying). We have been good friends over the years with a few unfortunate hiatuses. (National Review. 5/23/75 p. 544) cp.

(6) She said, I have just been at Macy’s. I have been going to Macy’s every day for the last two weeks. I am very *big* on Macy’s (New Yorker 5/16/77 p. 86 (1968)).

This new meaning is embedded into the frame of ENTHUSIASM which is closely connected with the frame of GENEROSITY (normally accompanied by frame of IRONY):

(7) I’m inclined to take pity on you. That’s *big* of you!

(8) A whole 5 pound! That was very *big* of her, I must say!

The two new frames represent a subordinate level of hierarchical structure of the macroframe of adjective *big*. The frames of EXTENSIVE ACTIVITY, AMBITION and ARROGANCE belong to the same subordinate level in the structure of the adjective. They are closely interconnected by way of metaphorical and metonymical projection and they overlap.

The frame of ARROGANCE is a relatively new emergent structure.

(9) George is such a show-off. He likes acting *big* sometime.

When a word is used in a discourse a particular frame of its conceptual structure is activated.

## 6. Conclusion

In the present paper we tried to explore the conceptual basis of semantic changes in present day English. We build on the interplay between creativity and conventionality in the process of new meaning creation. We tried to show that the new meaning of a word originates from the creative non-typical novel use of a traditional word in a non-typical linguistic environment. Three types of deviation have been analysed: pragmatic, semantic and cognitive. For the pragmatic invited inference to become semanticised as a new coded meaning it has to go through the process of conventionalisation, which normally lasts from twenty to one hundred years.

It was essential for the purposes of our analysis to distinguish between two types of linguistic inferences: pragmatic and cognitive. The former has to do with a context of a situation; the latter – with the changes in the conceptual structures of the original and new coded meanings. We tried to shed some light on the process of concept-narrowing and concept extension underlying the mechanisms of semantic changes. So the paper illustrates how inference actually becomes new reference as a result of intricate interplay between creativity and conventionality. Inference is always creative, reference is always conventional. We have tried to show that the conceptual structure of a polysemantic word is the major factor imposing constraints on deviation and meaning variation. The conceptual structure of a polysemantic word may be represented as a macroframe consisting of several frames which form a kind of radial structure. The

frames are interconnected with each other by way of metonymical and metaphorical projection as well as by extension through conceptual widening and narrowing.

# What the Avoidance of a Highly Grammaticalized Morpheme

## In SLA Tells Us: The Case of L2 Chinese

Yu LIU

Ph.D Candidate

Sun Yat-sen University

rachelyulau@hotmail.com

### Abstract

*Ba* that marks disposal relationship is a highly grammaticalized morpheme in Chinese. This article analyzes how Korean learners of Chinese language avoiding using one kind of *ba* -construction that marks displacement, with a view to understand how non-native speakers comprehend *ba* and *ba*-construction in their cognitive system, and how L1 and target language knowledge react in interlanguage construction. 25 intermediate-level Korean speakers are tested in the written task. The results show that L2 learners draw heavily from their L1 to found a paring counterpart of *ba*-construction, which causes grammatical errors and information asymmetry, bringing out the “missing” meaning of this grammaticalized morpheme.

**Keywords:** Chinese *ba*-construction; avoidance; grammaticalized morpheme; disposal relationship; cognitive system

### ***Ba*-construction and its performance in L2 Chinese**

In Mandarin Chinese, *ba*-construction is generally one of the most difficult constructions for L2 Chinese learners because of its complexity. Early studies of Chinese SLA show that, learners not only find it difficult to understand the abstract meaning of *ba*, but also have unsatisfied performance on using it correctly and properly. (Yu 2000; Wang 2003, 2004; Lu 2003; Huang & Yang 2004; Li & Deng 2005; Cheng 2006) In many case, Learners rather applied the strategy of avoiding *Ba*-construction rather than making mistakes. (Yu 2000; Li & Wang 2001; Luo 1999, 2000; Liu 2003)

*Ba* is highly grammaticalized in the process of historical development, whose origin with the meaning of “to take” and “to hold” can be traced back as early as the 5th to 3rd centuries B.C. (Bennett 1981; S. Yang 1995 etc.). In modern Chinese, there is an argument which is generally accepted that *ba* is an overt accusative case marker with the function of subjective disposition by exploring the semantic features and the syntactic analysis all subtypes of *ba*-construction. The form of *Ba*-construction basically involves five parts, which can simply express as “NP<sub>1</sub>+ *ba* + NP<sub>2</sub>+ Verb. + XP”. That is, the sentence begins with a subject (NP<sub>1</sub>), which can be omitted in the case when the subject is already mentioned in the previous sentence. *Ba* is used after

NP<sub>1</sub>, followed directly by an object (NP<sub>2</sub>). A verb with XP before or after is used at the end of the sentence. This XP can be an adjective (1b) or aspect markers (1c) or complements that refer to the result of an action (1a, 1d).

- (1) a. Wo **ba** shu fang zai-zhuozi-shang.  
 I **ba** book put table on  
 “I put the book on the table.”  
 b. Ta **ba** fangzi mai le.  
 He **ba** house sell Asp-perfective  
 “He sold the house.”  
 c. Mama **ba** yifu xi ganjing le.  
 Mother **ba** clothes wash clean Asp-perfective  
 “Mother washed clean the clothes.”  
 d. Wo **ba** Renminbi huan cheng Meiyuan.  
 I **ba** RMB change into USD.  
 “I change RMB into USD”

Some subtypes of *ba*-constructions (2a, 3a) have non-*ba* counterparts (2b, 3b), sharing all the other parts except for the word *ba*. There is little difference between two constructions that they can be exchanged in most of the cases. But as to some specific subtypes, i.e. displacement *ba*-construction (4a), there are no non-*ba* counterparts (4b) that exist, which means that *ba* is forced to use in the construction.

- (2) a. Ta **ba** nage fangzi mai le.  
 He **ba** that house sell Asp-perfective  
 “He sold that house.”  
 b. Ta mai le nage fangzi.  
 He sell Asp-perfective that house.  
 “He sold that house.”  
 (3) a. Mama **ba** yifu xi ganjing le.  
 Mother **ba** clothes wash clean Asp-perfective  
 “Mother washed clean the clothes.”  
 b. Mama xi ganjing yifu le.  
 Mother wash clean clothes Asp-perfective  
 “Mother washed clean the clothes.”  
 (4) a. Ta **ba** shu fang zai-zhuozi-shang.  
 He **ba** book put table on.  
 “He puts the book on the table.”  
 b. Ta fang shu zai-zhuozi-shang.  
 He put book table on.  
 “He puts the book on the table.”

Chinese *ba*-construction is very unique when compared with some other languages, i.e. English and Korean. There are no *ba* equivalent morphemes in most

languages with the exception of Vietnamese, as shown in (5).

- (5) a. I put the book on the table. (English)  
b. Wo *ba* shu fang zai-zhuozi-shang. (Chinese)  
I *ba* book put table on  
c. Ney-ka cheyk-ul cheyk-sang wi-ey tu-ot-ta. (Korean)  
I-Nom book-Object table on put-Past tense

Crosslinguistics factors, therefore, should be taken into consideration when answering questions concerning the variations and avoidance of *ba*-construction in Chinese SLA.

### Research Questions

The use of *ba* is forced to use in the structures referring to displacement. It is the typical and highly used subtype of *ba*-construction. It has the form in “NP<sub>1</sub> + *ba* + NP<sub>2</sub> + V. *zai* / *dao* + NP<sub>3</sub> + locative”, in which “*zai*+ NP<sub>3</sub>” or “*dao*+ NP<sub>3</sub>” both indicates the ending locations of the movement, as shown in (6a).

- (6) a. Ta ba shu fang zai-zhuozi-shang.  
He BA book put table on .  
“He puts the book on the table.”

There are three constructions applied in the same manner NP<sub>1</sub>, NP<sub>2</sub> and NP<sub>3</sub> with minor variation in meaning according to the context.

We would like to explore the cognitive system of *ba*-construction of L2 Chinese learners through examining the following questions:

- (i.) Why and how do learners avoid *ba*?
- (ii.) What does the avoidance of *ba* tells us?
- (iii.) Is the explanation “a subjective disposition marker” strong enough?

### Method

#### *Material and Procedure*

Cross-sectional data was collected from L2 Chinese learners through a sentence completion task. The task included 8 target items in four categories, representing four contexts (see Appendix). Four contexts were as follows:

- (i) To introduce the room. The context does not contain subjective disposition meaning and requires sentences with locations as the subject, i.e. existence sentence “N<sub>3</sub> + locative + you/V.zhe + N<sub>2</sub>” (7a).

(7) a. Zhuozi-shang you / fang zhe yi-ben shu.  
Table on there is put Asp-imperfective a book  
“There is a book on the table.”

(ii) To clean up the room (*I*). The context contains subjective disposition meaning and requires sentences with agents as the subject, in which the agents are emphasized, i.e. *ba*-sentence (7b).

(7) b. Ta *ba* shu fang zai-zhuozi-shang.  
He *ba* book put table on .  
“He puts the book on the table.”

(iii) To locate objects. The context does not contain subjective disposition meaning and requires sentences with objects as the subject, i.e. markedless passive sentence “N<sub>2</sub> + V.zai/dao + N<sub>3</sub> + locative” (7c) and also existence sentence “N<sub>2</sub> + zai + N<sub>3</sub> + locative” (7d).

(7) c. Shu fang zai-zhuozi-shang.  
Book put table on  
“The book is put on the table.”

(7) d. Shu zai-zhuozi-shang.  
Book table on  
“The book is on the table.”

(iv) To clean up the room (*II*). The context contains subjective disposition meaning and requires sentences with agents as the subject, in which the agents are not emphasized, i.e. *ba*-construction (7b).

The four categories were similar to some extent because they shared the same subjects and objects. We would like to see how participants chose different sentence patterns to fit into different contexts and in which context they might use other patterns rather than *ba*-construction.

The task was pilot-tested with 10 native speakers, and whose responses were 90% target. The data was collected at Sun Yat-sen University during regular class session, and it took around 20 minutes to complete. Responses were coded according to taking approximately the sentence pattern the participants used. Spelling errors and other irrelevant errors were ignored.

## Participants

The twenty-five participants are Korean students ranged from 18 to 25 years old. The students were in the same intermediate level Chinese class at the time of data collection. The participants were taught the *ba*-construction in their previous studies.

## Results

All participants finished the task. The data was divided into three groups according to the sentence pattern, including (i) sentences with objects as the subject (7c, 7d); (ii) sentences with locations as the subject (7a); (iii) sentences with agents as the subject. Group (iii) includes *ba*-sentences (7b) and error non-*ba* sentences that participants produced, such as “N<sub>1</sub> + V. + N<sub>2</sub> zai/dao + N<sub>3</sub> + locative”(8).

- (8). Ta fang shu zai-zhuozi-shang.  
 He put book table on .  
 “He puts the book on the table.”

Data was put in the form of a matrix, which better showed the central tendency of sentence distribution for 8 target items (see Table1).

**Table 1** Matrix of sentence distribution

no disposition	A (objects as the subject)	B (locations as the subject)
dispositoin	C (agents as the subject)	D (ba-sentence)

Results indicate that the central tendency of sentence distribution state what the tendency is (see Table 2). In Context (i), students were required to produce two sentences for a paragraph in order to introduce a room. 70% of them chose sentences that do not contain subjective disposition meaning, with location as the subject (*Shuzhuo pang you yige zuqiu. There is a football near to the desk.*), which were accorded with the context. 30% chose sentences with objects as the subject (*Zuqiu fang zai shuzhuo pang. The football is put near the desk.*) 1% used *ba*-constructions. Few students chose sentences with agents as the subject.

**Table 2** Distribution of sentences in four contexts

To introduce the room		To clean up the room I		To locate the objects		To clean up the room II	
29	70	18	2	77	15	82	1
1	1	76	80	2	8	16	17

Context (ii) concerned cleaning up the room, in which agents were emphasized since different actions were finished by different family members according to the paragraph. 76% of the students chose *ba*-constructions as the context required. There was no obvious avoidance of using *ba*-construction. On the other hand, 11% chose sentences with objects as the subject (*Zuqiu fang zai zhuozi pang. The football is put*

near the desk.), and 2% used sentences with locations as the subject (*Shuzhuo pang you yige zuqiu. There is a football near to the desk.*) In Context (iii), students located the objects in a room. The participants mainly chose sentences with objects as the subject (*Zuqiu fang zai zhuozi pang. The football is put near the desk.*), which matched the context. 14% of the participants chose sentences with locations as subject (*Shuzhuo pang you yige zuqiu. There is a football near to the desk.*). 2% chose *ba*-constructions. Notice in Context (iv), which concern cleaning up the room by one person, agent was not emphasized though the other parts were quite similar with those that were in Context (ii). 72% of the students chose sentences with objects as the subject (*Zuqiu fang zai zhuozi pang. The football is put near the desk.*), which was not what the context required. The paragraph did not sound as a coherent result. Only 16% chose the correct form: *ba*-construction. In this context, avoidance of using *ba* was obvious, which is the main issue this article examines. Moreover, there was a remarkable tendency that students selected markedless passive sentences instead of *ba*-constructions.

## Discussion

### *Syntax factor*

The avoidance of *ba*-construction is the result of some syntax factors. In context (i), (ii) and (iii), students chose proper sentence patterns with high accuracy, which means that they had strong context awareness, knowing whether or not to use certain sentences in some specific contexts. In other words, the reason of avoidance of *ba*-construction was not because they lacked of context awareness.

Context (ii) and (iv) both contain implication of subjective disposition meaning. Sentences with agents as the subject such as *ba*-constructions fitted in these contexts. But there was no obvious avoidance of *ba*-constructions in context 2, while in context 4 it was largely avoided. Two contexts were significantly similar to one another with the exception of the number of the subjects, which was the only syntax factor that caused avoidance. *Ba*-constructions were avoided and substituted by markedless passive sentences in the context that agent was not emphasized.

### Cognitive impact from L1

Meanwhile, the avoidance was also a result of negative transfer from L1. *Ba* is unique in Chinese, compared with Korean and other languages. In Chinese, the use of *ba* is when compulsory used to expressing displacement, as is shown in (9a). The subject (or agent) can sometimes be ellipsed when it has already been mentioned in previous context (9b). While there is no grammar marker in Korean that can be equated to *ba*, referring to displacement, as is shown in (9c). On the other hand, a markedless passive sentence that indicates location in Chinese (10a) has a one-to-one correlation

with a passive sentence in Korean (10b).

- (9) a. Wo *ba* shu fang zai-zhuozi-shang. (Chinese)  
I *ba* book put table on  
“I put the book on the table.”
- (9)b. Wo kai men, ranhou *ba* shu fang zai-zhuozi-shang.  
I open door then *ba* book put table on  
“I opened the door, and then put the book on the table.”
- (9) c. Ney-ka cheyk-ul cheyk-sang wi-ey tu-oss-ta. (Korean)  
I-Nom book-Object table on put-PST-DC  
“I put the book on the table.”
- (10) a. Shu fang zai-zhuozi-shang. (Chinese)  
Book put table on  
“The book is put on the table.”
- (10) b. Cheyk-en cheyk-sang wi-ey tu-oss-ta. (Korean)  
book-Nom table on put-PST-DC  
“The book is put on the table.”

In the syntax level, “*Wo ba shu fang zai-zhuozi-shang. (I put the book on the table)*” is simply the markedless passive sentence “*Shu fang zai-zhuozi-shang. (The book is put on the table)*” with “Subject + *ba*” as its beginning, using *ba* to indicating different context meanings: dynamic displacement or static reference of location. As for Korean, “*Ney-ka cheyk-ul cheyk-sang wi-ey tu-oss-ta. (I put the book on the table)*” is not only the subject *Ney-ka* combining with “*Cheyk-en cheyk-sang wi-ey tu-oss-ta*” (*The book is put on the table*), but also the change of the marker of *Cheyk* (*book*) from objective marker *-ul* into discourse marker *-en*. In a word, the key syntax function of separating dynamic displacement and static reference of location is *ba* in Chinese, while it is a case marker in Korean. The difference between non-subject *ba*-construction and markedless passive sentence is not only using *ba* or not, but also the context meaning of “subjective disposition” which is a hint that *ba* contains.

On the surface, Korean non-subject displacement sentence “*Cheyk-ul cheyk-sang wi-ey tu-oss-ta. ((Subject) put the book on the table)*” is very similar to Chinese markedless passive sentence “*Shu fang zai-zhuozi-shang. (The book is put on the table)*”. Indeed these two sentences are very much different with their context meanings. Non-subject *ba*-construction “*Ba shu fang zai-zhuozi-shang. ((Subject) put the book on the table)*” is actually the counterpart of the Korean non-subject displacement sentence. Influenced by similarities on the surface, Korean learners mis-equated non-subject *ba*-construction with Korean passive sentence. As a result, the learners thought that Chinese markedless passive sentence is equated to non-subject *ba*-construction. Therefore when agent (or subject) was not emphasized, non-*ba*-constructions were largely avoided and were substituted by markedless passive sentences, because of the negative transfer of L1.

## Conclusions

The avoidance of *ba*-construction was the result of both syntax factors and negative transfer from L1. When agent (or subject) was emphasized, there was no obvious avoidance of *ba*-constructions. When agent (or subject) was not emphasized, *ba* was largely avoided and substituted by markedless passive sentences. This study not only explores how the syntax hint of *ba* affects L2 learners' conception of *ba*-construction, but also illustrates how L1 negatively transfer to the L2 production. Moreover, this phenomenon in SLA also aided in analyzing the deeper contextual meaning of this highly grammaticalized *ba*. Finally, *ba* is not only a subjective disposition marker, but also an accusative case marker that emphasizes the agent.

Sunagome 808, Takizawa-mura, Iwate Prefecture, 020-0183, JAPAN

Takahashi\_yukio\_ling@msn.com

## Abstract

Adopting the insights of the work in Game Theory (cf. Dixit and Skeath (2004)), the present paper submits a thesis that the correspondence relations assumed in the Tripartite Parallel Architecture (cf. work by Ray Jackendoff) are “Equilibria among Grammatical Processing Gadgets” in the grammars of individual languages. The significant corollary of the thesis is that we may do away with the set of what are called the correspondence rules.

**Keywords:** consciousness, syntax-semantics interface, auditory-articulatory interface, semantics-pragmatics interface.

## 1. Theoretical Framework

### 1.1. *Notion of gadgets*

By the wording “ontological homology,” the paper intends to convey that we witness a horde of structural parallelisms among the two processes and/or entities: language and consciousness. Our minds are a hierarchy of sets of processing gadgets (cf. Minsky’s concept of the “society of mind”), which are constituted of essentially identifiable and finite structures of brain cells and organs of sensation. Thus, consciousness is a mental process that is brought about by some activation of specifiable portions of a hierarchical nature. Language is a system or a hierarchy of gadgets that defines the set of grammatical outputs. Crucially the outputs of the system of the mind are felicitous outputs from the system. And the felicitous output is identified and evaluated by game-theoretic pay-off relationships. The theoretical model of the mind internalizes hierarchically organized computational gadgets that give more than one mental strategy. The outputs of the system are states of equilibria among the computational strategies. The processes of consciousness and language are

games among these gadgets.

The flexibility of the size of the strategy in some sense motivates the flexibility of the size of domain where the strategies are executed. I would like to cite two examples of mismatch in correspondence (i) from syntax-semantics interface, (ii) from auditory-articulatory interface in phonology and (iii) semantics-pragmatics interface..

The major assumptions of the present paper are as follows:

(1) Gadgets and the Equilibria

- a. The three grammatical components, phonological, syntactic and conceptual components, are organized by hierarchies of gadgets, which process specified outputs (strategies).
- b. The equilibria among grammatical processing gadgets (henceforth, GPG) are formally definable points at which several relevant GPGs acquires payoffs that are strategically the most highest.

We witness a horde of structural parallelisms among the two processes and/or entities: language and consciousness. Our minds are a hierarchy of sets of processing gadgets, which are constituted of essentially identifiable and finite structures of brain cells and organs of sensation.

Thus, consciousness is a mental process that is brought about by some activation of specifiable portions of a hierarchical nature. Consciousness of freedom is also defined in terms of the range of behaviors of mental gadgets that are specifiable and finite. Thus, freedom is restricted in nature, and in the same vein, freedom evolves if the number of mental processing gadgets increases or if the constitution of the hierarchy is somehow changed.

Language is a system or a hierarchy of gadgets that defines the set of grammatically optimal outputs. Crucially the outputs of the system of the mind are felicitous outputs from the system. And the felicitous output is identified and evaluated by game-theoretic pay-off relationships. The theoretical model of the mind internalizes hierarchically organized computational gadgets that give more than one mental strategy. The outputs of the system are states of equilibria among the computational strategies. The processes of consciousness and language are games among these gadgets.

Dixit and Skeath (2004:28) observe that the key term of Game Theory *strategy* covers every size of complete plans of action:

- (2) The term *strategy* covers all the situations, meaning a complete plan of action when necessary and meaning a single move if that is all that is needed in the particular game being studied.

The flexibility of the size of the strategy in some sense motivates the flexibility of the size of domain where the strategies are executed.

In the following three sections, I would like to cite examples of correspondence between linguistic modules to motivate our game-theoretic architecture of the linguistic theory.

## 2. Syntax-Semantics Interface

One of the phenomena of mismatch between the two grammatical components we take up is the variations of *when* clauses as exemplified in Canonical *When* Clauses (henceforth, CWC) and Narrative *When* Clauses (henceforth, NWC):

### (3) Canonical *When* Clauses and Narrative *When* Clauses

- a. I read the book when I was ill in hospital. (Canonical)
- b. John was doing the dishes when in came the dog. (Narrative)

The NWC can occur in isolation, while the CWC cannot:

### (4) Occurrence in Isolation

- a. #I read the book. When I was ill in hospital.
- b. Jane was doing the dishes. When in came the dog.

We assume that the sequentiality of NWCs is an iconic idiosyncrasy of the English conjunction *when*. Crucially, at the discourse level, change of the order of simple-past and past-progressive sentences does not incur any drastic change in the description of the situation and the course of events (ter Meulen (2000:152)).

Crucially, at the discourse level, change of the order of simple-past and past-progressive sentences does not incur any drastic change in the description of the situation and the course of events (ter Meulen (2000:152)):

### (5) Short discourses with simple past and past progressive

- a. Jane was patrolling the neighborhood. She noticed a car parked in an alley.
- b. Jane noticed a car parked in an alley. She was patrolling the neighborhood.

The present paper assumes two assumptions on conceptual structures and temporal elements to account for the combined effect of the aspectuality types (i.e., simple past and past progressive) crucially defines the construal of the development of the events depicted in the discourses (P stands for points in time and R stands for region in time. cf. Jackendoff (1987:398-399)):

### (6) Alignment of Temporal Elements in Five Event Types

- a. Point Event: *The light flashed.* [P]

- b. Achievement: *Bill arrived*. [R P]
- c. Inceptive Event: *Bill left*. [P R]
- d. Processes: *Bill ran around*. [R]
- e. Progressive Forms: *Bill was running around*. [R P R]

We interpret the stipulations on the alignment of temporal elements in (6) to be strategies given by GPGs that generate conceptual structures. We assume that the narrative discourse crucially includes the type of linked clauses with what are called Ground-Figure advancement, which we formalize as a GPG that is placed higher in the hierarchy of GPGs in the grammar of English as instantiated in (7). The idea of (7) comes from Talmy’s work:

(7) Grammatical Processing Gadget (Narrative)

$R \rightarrow R P R$ , where the P stands for the endpoint of the relevant event

The GPGs for progressive and point events interact with the GPG to yield the matrix in (8), where the lower ranked GPGs give “0” or “1” while the higher ranked GPG of narrative gives “0” or “2”:

(8) Payoff Matrix for (3b and 4b)

	Grammatical Processing Gadget (Narrative)				
Grammatical Processing Gadget (Progressive Form)		ON	OFF		Grammatical Processing Gadget (Point Event)
	ON	1, 1, 2 	1, 1, 0	ON	
	OFF	0, 0, 0	0, 0, 0	OFF	

The optimal strategic combination is signaled by “” in the matrixes. Note that the same payoff matrix holds as for (3b) and (4b).

Firstly, some specific GPGs generate conceptual structures that are linked to temporal elements, as exemplified in (6). Only for the explanatory brevity I will omit reference to the contents of the formal representation of the conceptual structures. The names of the relevant GPGs are placed on the right-hand side of the structures with paired parentheses and brackets:

It is crucial to note that in the case of (3a) the GPG (Narrative) is Off because the subordinate clause *I was ill in the hospital* does not have an endpoint to anchor on the temporal element in the tier that the GPG (Narrative) generates.

### 3. Auditory-Acoustic Interface

#### 3.1. Coarticulation

Let us now turn to a thought experiment, i.e., a case of coarticulation: *key* /ki:/ and *caw* /kɔ:/. At the systematic phonemic level, we observe one and the same segment /k/ word-initially. A careful observation of our pronunciation will give you an idea about the subtle but clear differences between the two instances of /k/ (Kühnert and Nolan (1999:7)), transcribed as follows:

(9) *key* [k̟i:] *caw* [k̠<sup>w</sup>ɔ:]

The /k/ in *key* is advanced, while that in *caw* is rounded and retracted. A caveat follows (Kühnert and Nolan (1999:7-8)):

(10) It is essential to the concept of coarticulation that at some level there be invariant, discrete units underlying the variable continuous activity of speech production. If this were not the case, and, for instance, the mentally stored representation giving rise to a production of the word ‘caw’ were a fully detailed articulatory plan, then when that word was spoken (in isolation at least) there would be no question of a process of articulation – the word would simply correspond to a set of instructions for the time-varying activity of the articulators, and sub-word segments would not exist in any sense, and could therefore not undergo ‘coarticulation’.

Kühner and Nolan’s (1999) discussion cited in (10) presupposes the notion of *underspecification* of predictable attributes at the level of underlying representation, as formalized by Archangeli (1984). Thus, the attribute “advanced” for the /k/ in *key* and the properties of roundedness and retractedness of the /k/ in *caw* are predictable.

Let us further develop our discussion of coarticulation toward a theoretically adequate explanation. Farnetani (1990:94ff) distinguishes between two main lines of thought in our explanation of coarticulation: “translation theories” and “intrinsic timing theories.” The first category adopts “the idea that coarticulation is a modification of the ‘units’ of canonical segments.” In the second, “there is no dichotomy between plan and execution and coarticulation is not an alteration of canonical forms but just the way the segments are serially ordered in speech.” Farnetani (1990:96) emphasizes what is, in our terminology, the strategic interplay of the phonological processing gadgets (henceforth, PPG):

- (11) ... the significance of the effects of articulatory constraints on the coarticulatory movements, i.e. on the complex interplay between influencing and influenced sounds, and on the relationship between *coarticulation and articulatory antagonism* [italics—YT].

In the wording “coarticulation and articulatory antagonism,” we notice a game-theoretic relationship among players in strategic environments.

Thus the present paper submits a thesis to the effect that the activity of articulating a linguistic sound is a “game” among PPGs. Thus we accept the following assumptions:

(12) Assumptions on Phonological Processing Gadgets

- a. Linguistic articulations of sounds emerge out of the interactions of articulatory strategies of PPGs distributed on a parallel fashion.
- b. PPGs are composed of smaller agents that cannot plan articulatory strategies.
- c. Articulatory strategies of a PPG are selected and applied so as to reach equilibria with those of other PPGs.

Let us return now to our examination of the cases in (9): *key* [ḳi:] and *caw* [ḳ<sup>w</sup>ɔ:]. We observe that four PPGs operate in the realization of [ḳ<sup>w</sup>]:

(13) PPGs in [ḳ<sup>w</sup>]

- a. PPG for velic closure
- b. PPG for lip rounding
- c. PPG for retracting the tongue root
- d. PPG for spreading of attributes

Only for typographical convenience, I will adopt a functional notation PPG (G) to refer to “PPG for G”: Thus, (13b) is written as PPG (lip rounding).

Going back to our reference to conceptual foundations for the new paradigm of linguistic theory in (1), the three concepts will now be projected into more concrete forms:

(14) Basic Concepts of PDP, SOC and NE in Concrete Terms

- a. The phonetic form of [ḳ<sup>w</sup>] emerges out of the interactions of PPG (velic closure), PPG (lip rounding), PPG (tongue root retraction), and PPG (syllable onset).
- b. The four PPGs in (8) are hierarchically organized so as to produce [ḳ<sup>w</sup>].
- c. The strategies of PPGs are executed with respect to those of other PPGs.

The “payoff” for the execution of strategies by the three PPGs, i.e., PPG (velic closure), PPG (lip rounding), PPG (tongue root retraction), is evaluated by PPG

(syllable onset) to which they are linked.

Let us assume that the payoff for PPGs is the anchoring on the temporal elements, and transcribe it by [1]; if they are not anchored, transcribe the situation by [Ø]. If any marked strategy is applied, transcribe this by [-1]. We assume that the spreading of feature values is an application of unmarked strategies, transcribed as [1]. The symbols ON and OFF describe whether or not the PPG is anchored on the temporal elements. PPG (a, b) will stand for the linkage of PPG (a) with PPG (b). Thus, the crucial game-theoretic payoff matrices for [k̥<sup>w</sup>ɔ:] and \*[k̥<sub>ɣ</sub>ɔ:] are shown below (Henceforth, vc stands for velic closure, lr for lip rounding, and trr for tongue root retraction. Note that the pay-off of spreading is described as the element of the 3rd dimension):

(15) Payoff Matrices for [k̥<sup>w</sup>ɔ:]

a. Sub-matrix for PPG (lr)

	PPG (syllable nucleus, lr) ON	PPG (syllable nucleus, lr) OFF
PPG (syllable onset, lr) ON	(-1, 1, 1) ¶	(-1, -1, -1)
PPG (syllable onset, lr) OFF	(Ø, 1, -1)	(Ø, -1, Ø)

b. Sub-matrix for PPG (trr)

	PPG (syllable nucleus, trr) ON	PPG (syllable nucleus, trr) OFF
PPG (syllable onset, trr) ON	(-1, 1, 1) ¶	(-1, -1, -1)
PPG (syllable onset, trr) OFF	(Ø, 1, -1)	(Ø, -1, Ø)

(16) Payoff Matrices for \*[k̥<sub>ɣ</sub>ɔ:] (PPG (adv) stands for PPG (advanced))

a. Sub-matrix for PPG (adv)

	PPG (syllable nucleus, adv) ON	PPG (syllable nucleus, adv) OFF
PPG (syllable onset, adv) ON	(-1, -1, 1)	(-1, Ø, -1) ¶
PPG (syllable onset, adv) OFF	(Ø, -1, -1)	<u>(Ø, Ø, Ø)</u>

b. Sub-matrix for PPG (trr)

	PPG (syllable nucleus, trr) ON	PPG (syllable nucleus, trr) OFF
PPG (syllable onset, trr) ON	(-1, 1, 1)	(-1, -1, -1)
PPG (syllable onset, trr) OFF	(Ø, 1, -1) ¶	(Ø, -1, 1)

The underlined portions are assigned relatively high values in the relevant tables, while the symbol “¶” indicates that the linked activations of PPGs are executed. The

instance of pronunciation [k̥<sup>w</sup>ɔ:] is evaluated higher than \*[k̥ɔ:] within our framework of game-theoretic evaluations of applications of phonological strategies. The notion of “states of equilibria among articulatory gadgets” is directly captured by the total sum of the values that those gadgets have achieved.

The relationship among the PPGs, which I will call “the society of phonological processing gadgets,” can be diagrammed as follows:

(17) Society of PPGs (partial and tentative)

PPG (spread) is assumed to be composed of PPG (identification of slots) and PPG (link), the former of which, in turn, is composed of two PPGs. It is probable that the higher the PPG, the larger the value of (non-) achievements.

It is crucial to note that the set of strategies in the case of coarticulation is interpreted to correspond to stipulations defined in the associated *K-society*. Thus the total sum of the pay-off matrix of [k̥<sup>w</sup>ɔ:] is higher than any of the other candidates, where the sum is calculated with respect to the *S-society* and the *K-society*.

### 3.2. High-Vowel Devoicing in Japanese

The second example from the phenomena of mismatch between the two grammatical components is the cases of the interaction of voicing of stops and vowel devoicing observed in the phonology of two dialects of Japanese, as observed below:

(18) High Vowel Devoicing in the Two Dialects of Japanese

a. [NHK]

[ç̥i̥ktɯi] “low”, [ç̥i̥ŋaçi] “east”, \*[ç̥i̥ŋaçi] “east”

b. [Tohoku]

[ç̥i̥gtɯi] “low”, [ç̥i̥ŋaçɯi] “east”, \*[ç̥i̥ŋaçɯi] “east”

The present paper inherits traditional assumptions on phonological representations and derivations: (i) Autosegmental spreading of features (cf. Sagey (1986)) and (ii) Structure preservation (cf. Kiparsky (1985)). The two devices govern a finite number of identifiable phonological processing gadgets (henceforth, PPGs) and they are governed by the gadget *Cognitive Effect*. (i) the PPG *Spread* is an instance of *S-society* and the PPG *Structure Preservation* is an instance of *K-society* and (ii) that these two societies

are interconnected spirally, by which I mean that the *S-society* maps out a set of strategies (virtual articulatory gestures) of the PPGs and the set is sent to the *K-society* to have verifications of the correspondence with lexical representations. Some “administrative agents” (cf. Minsky (1988:102)) may intervene between the agent *Cognitive Effect* and the two agents *Spreading* and *Structure Preservation*.

Crucially I assume that the cooperative and non-cooperative relations among agents (gadgets) are parameterized. Thus, in the northern dialect of Japanese (Tohoku), the process of voicing of vowels is cooperative with voicing of obstruents, while in the variety of Japanese spoken in NHK (Japan Broadcasting Corporation) the two processes are antagonistic to each other. In the Tohoku dialect, devoicing of the high vowels in front of voiced consonants may be evaluated higher because it crucially satisfies the agents *Cognitive Effect* (the agent *Cognitive Effect* consults information stored in *K-society* to confirm that the palatalized fricative of *ch* (in *ich*) implies [i]) and *Spreading* ([+high] is shared by the variety and [i]), though it militates against the general devoicing of high vowels in the environment “[–voiced]\_\_\_[–voiced]” (cf. Vance (1987)).

#### 4. Semantics-Pragmatics Interface

In certain situations where two agents (i.e., persons) interact with each other to form one sentence with a conditional subordinate clause, we observe game-theoretic pay-off relations in the environment of communication. Let us assume that Agent  $\alpha$  utters a conditional subordinate clause and Agent  $\beta$  utters a corresponding main clause, as follows:

(19) Two Types of *If* Clause

- a. If you ask him kindly, John will help you.
- b. If you ask him kindly, John would not help you.

The sentence in (19a) is a discourse conditional (Athasiadou and Driven (2000:14)), while that in (19b) is interpreted to be a concessive clause. In (19a), if Agent  $\alpha$  expects that John will help him and if Agent  $\beta$  utters a positive consequence, the payoff relation can be [+1, +1]; when the positive expectation of the Agent  $\alpha$  is negated by Agent  $\beta$  as in (19b), the payoff relation is [–1, 0], which incurs a communicative confusion. In the case where the two agents agree with the negative prediction, we have a concessive reading as in (19b), transcribed as [+1, +1]: in the case where Agent  $\alpha$  is negative and Agent  $\beta$  is positive, we will be in an uninterpretable

confusion, transcribed as  $[-1, 0]$ .

#### **4. Concluding Remarks**

The theoretical framework of the present paper militates against a major assumption in the Optimality Theory (henceforth, OT) by Prince, McCarthy and Smolensky, which declares to totally abandon any reference to the derivational contents in the grammar of language: Richness of the Base Hypothesis. OT faces with an unsolvable problem, which is articulated as follows: Is the set of faithfulness constraints applicable to the input (base) forms GEN that are enumerated with no principled restrictions? Our game-theoretic approach assumes specifications on computational gadgets so that it gives a natural explanation for the fact that the range of the possible inputs is virtually specifiable.

---

# Japanese particle *shika* ‘only’

Akio Hasegawa

University at Buffalo, The State University of New York  
210M South Lake Village, Buffalo, NY 14261  
ah36@buffalo.edu

## Abstract

The Japanese particle *shika*, which has been viewed as equivalent to an exclusive marker such as *only*, seems at first blush to conflict with a compositional analysis of the semantics due to the unique property of this particle of always co-occurring with the negative morpheme *-na*. Yoshimura (2006) argues that *shika* is an exceptive marker like *everyone/thing except* and proposes a straightforward compositional semantics for it. In this paper, I discuss the semantic properties of exclusive and exceptive markers and argue that *shika* is indeed an exclusive marker. The exclusive particle *shika* entails the positive proposition in contrast to the exceptive counterpart, which just implicates the positive proposition.

**Keywords:** exclusive marker, exceptive marker, entailment, implicature, compositional semantics

## 1. Is *shika* ‘only’ or ‘everything except’?

When describing the meaning of an exclusive marker such as English *only*, one can think of two semantic components, the ‘positive’ and ‘negative proposition’. For example, sentence (1) expresses the positive proposition ‘John came’ and the negative proposition ‘Nobody except John came’.

(1) *Only John came.*

There have been debates about the status of these two semantic components: whether they are presupposition or assertion, or just implicature (Horn 1996, Atlas 1996). However, although very interesting, these discussions are not particularly relevant in the context of this paper.

Japanese has a particle *shika*, which is usually translated as an exclusive marker such as English *only*. If this analysis is correct, *shika* has to have the two semantic components, the positive and negative proposition.

However, what is interesting about the particle *shika* is that it obligatorily co-occurs with the negative morpheme *-na*, as shown in (2).

(2) *Daisuke-shika ko-na-katta.*

Daisuke-SHIKA come-NEG-PAST

a. ‘Only Daisuke came.’

b. ‘Everyone except Daisuke did not come.’ (Yoshimura 2006)

The sentence (2), although it has the negative morpheme *-na*, does not mean that ‘only Daisuke did not come’; it means that ‘only Daisuke came’. If *shika* means ‘only’ and (2a) is the translation of the sentence (2), the negative morpheme *-na* does not seem to contribute to the meaning of sentences in which *shika* occurs.

One of the compositional analyses of the occurrence of the negative morpheme *-na* with *shika* that has been proposed is Yoshimura (2006)’s, who argues that *shika* is an ‘exceptive’ marker like English’s *everyone except*. In her analysis, the sentence (2) means (2b); the negative morpheme *-na* has a straightforward compositional interpretation.

The difference between the widely accepted translation of *shika* as ‘only’ and Yoshimura’s analysis consists in whether the positive proposition is part of the meaning of the sentence. In the analysis of *shika* as an exclusive marker like English *only*, a sentence in which *shika* occurs entails both the positive and negative proposition, while in Yoshimura’s analysis of *shika* as an exceptive marker, a sentence in which *shika* occurs entails only the negative proposition and the positive proposition is just an implicature. The particle *shika* is less negative in the exclusive analysis compared to the exceptive analysis, in the sense that the positive proposition is a part of the meaning.

In this paper, I argue that *shika* is actually an exclusive marker although Yoshimura (2006)’s analysis seems to explain the existence of the negative morpheme *-na* straightforwardly. In the following sections, after looking at one particular piece of evidence which Yoshimura presents to support her analysis, I discuss four semantic properties, all of which cannot be explained if *shika* is considered to be an exceptive marker. After that, I discuss the compositional semantics of *shika* and the negative morpheme *-na*. The semantics is not straightforwardly represented because the action of a person referred to by the subject is negated although *shika* always co-occurs with a negation.

## 2. Yoshimura (2006)

Yoshimura (2006)'s analysis of *shika* as an exceptive marker is based on the following constraint:

- (3) Exceptive marker: Exceptive phrases cannot combine with non-universal quantifiers such as *most*.

The English sentences in (4) are not acceptable because they violate the constraint.

- (4) #*Most*/#*Three*/#*At least three*/#*Few*/#*The students but John came*.

The Japanese sentences in (5), in which the noun phrase marked with *shika* combines with non-universal quantifiers, are not acceptable either.

- (5) *John-wa ninjin-shika (\*mi-ttsu /\*takusan-no)*  
John-TOP carrot-SHIKA 3-CL/many-MOD  
*yasai-o tabe-naka-tta.*  
vegie-ACC eat-NEG-PAST  
'John didn't eat three/many vegetables but carrots.'

According to Yoshimura (2006), who argues that *shika* is an exceptive marker, the sentences in (5), in which the non-universal quantifiers, *mittu* and *takusanno* are combined with *shika*, are unacceptable because of the constraint in (3).

## 3. Arguments against Yoshimura (2006)

### 3.1 Downward entailment

Yoshimura (2006)'s analysis seems to explain the semantics of *shika* and the combination with the negative morpheme *-na* straightforwardly. However, there are several semantic properties which cannot be explained if one assumes that *shika* is an exceptive marker. In the following sections, I show differences between the particle *shika* and another particle, *igai*, which I treat as an exceptive marker, by comparing the two particles with English counterparts, namely *only* and *everyone except*. With respect

to four semantic properties I discuss, *shika* behaves more like *only*, and *igai* behaves more like *everyone except*.

One difference between *shika* and *igai* is found in entailment patterns. English *only*, when it focuses on a proper noun, is not downward entailing. (6a) does not entail (6b), whose predicate denotes a subset of what is denoted by the predicate in (6a). Even if Daisuke came, it does not necessarily follow that Daisuke came late. Similarly, *shika* is not downward entailing: (7a) does not entail (7b).

(6) a. **Only** Daisuke came.

b. **Only** Daisuke came late.

(7) a. Daisuke-**shika** ko-na-katta.

Daisuke-SHIKA come-NEG-PAST

‘**Only Daisuke came.**’ or ‘Everyone except Daisuke didn’t come.’

(Yoshimura 2006)

b. Daisuke-**shika** okurete ko-na-katta.

Daisuke-SHIKA late come-NEG-PAST

‘**Only Daisuke came late.**’ or ‘Everyone except Daisuke didn’t come

late.’ (Yoshimura 2006)

However, English *everyone except* plus negation is downward entailing: (8a) entails (8b). In every situation in which the proposition that ‘everyone except Daisuke did not come’ is true, the proposition that ‘everyone except Daisuke did not come late’ is also true.

(8) a. **Everyone except** Daisuke didn’t come.

b. **Everyone except** Daisuke didn’t come late.

Japanese *igai* is also downward entailing. When the sentence (9a) is true, (9b) also always true.

- (9) a. *Daisuke-igai ko-na-katta.*  
 Daisuke-except come-NEG-PAST  
 ‘Everyone except Daisuke didn’t come.’
- b. *Daisuke-igai okurete ko-na-katta.*  
 Daisuke-except late come-NEG-PAST  
 ‘Everyone except Daisuke didn’t come late.’

As shown in (6)–(9), *shika* and *only* are not downward entailing while *igai* and *everyone except* plus negation are downward entailing.

### 3.2 Entailment and implicature

Another semantic property distinguishing *shika* from *igai* is the status of the positive proposition. A sentence in which *shika* occurs entails the positive proposition while a sentence in which *igai* occurs just implicates the positive proposition.

After the sentence (10a), it is contradictory to say (10b). Since (10a) entails the positive proposition ‘Daisuke ate apples’, if one tries to cancel the positive proposition by saying (10b), one contradicts oneself. (11a), which suspends the entailment expressed by (11b) is not natural if followed by (11b). (11a) indicates that the speaker does not have a clear idea about whether the proposition ‘Daisuke came’ is true. (11b), which entails the positive proposition ‘Daisuke came’, is not compatible with the previous sentence, which suspends the truth value of the same proposition.

The examples in (10) and (11) show that a sentence in which *only* occurs entails the positive proposition, and it cannot be uttered in a context in which the positive proposition is cancelled or suspended.

- (10) a. **Only** *Daisuke ate apples.*
- b. #*And, Daisuke didn’t eat apples either.*
- (11) a. *I’m not sure whether Daisuke came, but...*
- b. #**Only** *Daisuke came.*

*Shika* shows the same pattern as *only*. After (12a), (12b) is not natural, and after (13a), (13b) is not natural. These examples indicate that a sentence in which *shika* occurs entails the positive proposition.

(12) a. *Ringo-o Daisuke-shika tabe-na-katta.*  
 apple-ACC Daisuke-SHIKA eat-NEG-PAST  
 ‘Only Daisuke ate apples.’

b. #*Sorekara Daisuke-mo tabe-na-kattanda.*  
 and Daisuke-also eat-NEG-PAST  
 ‘And, Daisuke didn’t eat apples either.’

(13) a. *Daisuke-wa ki-ta ka wakara-na-i-kedo*  
 Daisuke-CONTRASTIVE come-PAST if know-NEG-PRES-but  
 ‘I’m not sure whether Daisuke came, but...’

b. #*Daisuke-shika ko-na-katta.*  
 Daisuke-SHIKA come-NEG-PAST  
 ‘Only Daisuke came.’

However, after (14a), in which *everyone except* occurs, you can say (14b). One could wonder if (14) is actually a natural sequence because the speaker could just say a sentence *nobody ate apple* instead of the sequence in (14). The following context would help to make (14) a natural sequence: suppose somebody trying to demonstrate that nobody ate apples proceeds by considering two cases: first, they show that ‘nobody except Daisuke ate apples’; and having established that, they proceed to make the point that ‘Daisuke didn’t eat apples either’. In contrast to (11), after (15a), you can say (15b). (14b) cancels the positive proposition of (14a), and (15b) is not unacceptable after the positive proposition of the sentence has been blocked in the previous sentence. While a sentence in which *only* occurs entails the positive proposition, a sentence in which *everyone except* occurs just implicates the positive proposition, and therefore, the sentence is still acceptable even in a context in which the positive proposition will be cancelled, or the positive proposition is already blocked.

(14) a. **Everyone except** Daisuke didn't eat apples.

b. *And, Daisuke didn't eat apples either.*

(15) a. *I'm not sure whether Daisuke came, but...*

b. **Everyone except** Daisuke didn't come.

*Igai* shows the same pattern as *everyone except*. After (16a), you can say (16b) and cancel the positive proposition expressed by (16a). Similarly, after (17a), which suspends the positive proposition of (17b), one still can say (17b) without contradicting oneself. This indicates that a sentence in which *igai* occurs just implicates the positive proposition as *everyone except*.

(16) a. *Ringo-o Daisuke-igai tabe-na-katta.*  
apple-ACC Daisuke-except eat-NEG-PAST  
'Everyone except Daisuke didn't eat apples.'

b. *Sorekara, Daisuke-mo tabe-na-kattanda.*  
and Daisuke-also eat-NEG-PAST  
'And, Daisuke didn't eat apples either.'

(17) a. *Daisuke-wa ki-ta ka*  
Daisuke-CONTRASTIVE come-PAST if  
*wakara-na-i-kedo*  
know-NEG-PRES-but  
'I'm not sure whether Daisuke came, but...'

b. *Daisuke-igai ko-na-katta.*  
Daisuke-except come-NEG-PAST  
'Everyone except Daisuke didn't come.'

*Shika* and *igai* show the same pattern as *only* and *everyone except* respectively, regarding the status of the positive proposition. A sentence in which *shika* or *only* occurs entails the positive proposition, and it is not acceptable in a context in which the positive proposition will be cancelled or is already blocked, while a sentence in which

*igai* or *everyone except* occurs just implicates the positive proposition and is acceptable even in a context in which the positive proposition will be cancelled or is already blocked.

### 3.3 What is focused by *shika*

So far, the differences between *shika* and *igai* have been discussed by comparing the two particles with English *only* and *everyone except*. In the following examples, I do not compare the two Japanese particles with the English counterparts because they do not show strictly the same pattern. However, what I argue is that *shika* is “less negative”, so to speak, than *igai*, and for this purpose, it is enough to show differences between the two Japanese particles.

There is a difference between what is focused by *shika* and what is focused by *igai*. I use the terms ‘complement set’ and ‘reference set’, following Moxey & Sanford (1987). The reference set consists of individuals which are referred to by the focused noun phrase, and the complement set consists of individuals excluding the one referred to by the focused noun phrase. In the sentence (18), for example, the reference set contains only Daisuke and the complement set is the set of individuals which are not Daisuke.

- (18) *Ringo-o Daisuke-shika tabe-na-katta.*  
apple-ACC Daisuke-SHIKA eat-NEG-PAST  
‘Only Daisuke ate apples.’

In the previous section, I showed that a sentence in which *shika* occurs entails both the positive and negative proposition while a sentence in which *igai* occurs entails only the negative proposition. *Shika* and *igai* focus on what is mentioned in the entailed propositions. What is focused by *shika* is either the complement set or reference set, since a sentence in which *shika* occurs entails both the positive and negative proposition, and what the positive and negative proposition mention are the reference and complement set, respectively. What is focused by *igai*, on the other hand, is only the reference set since a sentence in which *igai* occurs entails only the negative proposition, and what the negative proposition mentions is only the reference set.

To the question in (19), in which *shika* occurs, for example, the answers in (19a) and (19b) are both acceptable because what is focused by *shika* can be either the complement set or the reference set.

(19) *Ringo-o Daisuke-shika tabe-na-katta-no.*  
apple-ACC Daisuke-SHIKA eat-NEG-PAST-Q  
'Did only Daisuke eat apples?'

a. *Un Daisuke-wa tabe-ta.*  
Yes Daisuke-CONTRASTIVE eat-PAST  
'Yes, Daisuke ate.'

b. *Un Takuya-wa tabe-na-katta.*  
Yes Takuya-CONTRASTIVE eat-NEG-PAST  
'Yes, Takuya didn't eat.'

However, to the question in (20), in which *igai* occurs, the answer in (20a) is not completely natural, whereas the answer in (20b) is acceptable. This indicates that what is focused by *igai* is only the complement set.

(20) *Ringo-o Daisuke-igai tabe-na-katta-no.*  
apple-ACC Daisuke-except eat-NEG-PAST-Q  
'Did everyone except Daisuke not eat apples?'

a. *#Un Daisuke-wa tabe-ta.*  
Yes Daisuke-CONTRASTIVE eat-PAST  
'Yes, Daisuke ate.'

b. *Un Takuya-wa tabe-na-katta.*  
Yes Takuya-CONTRASTIVE eat-NEG-PAST  
'Yes, Takuya didn't eat.'

It should be noted that the answer in (20a) is not completely unacceptable in some situations although the speaker does not seem to reply directly to the question in (20) in those situations. As I mentioned above, the answer in (20a) is not completely natural because it talks about the referent set to the question which asks about the complement set. However, the speaker might nevertheless opt for (20a) in case she does not have a clear idea whether or not everyone did not eat apples although in this case, the speaker would omit *un* 'yes'.

Another situation in which (20a) could be acceptable is when the question in (20) is used to ask another question indirectly. This is possible because although a sentence in which *igai* occurs entails the negative proposition and typically talks about the complement set, it also implicates the positive proposition and talks about the reference set implicitly. If a person who is asked the question in (20), somehow figures out from context that the person who asks the question (20) actually seeks information about the reference set, then (20a) could be acceptable.

Although there are several situations in which (20a) could be acceptable, (20a) is not the proper answer to the question in (20) in those situations. The difference between pragmatically appropriate and inappropriate answers is subtle. But *shika* differs from *Igai* in the conditions under which it occurs in appropriate answers to questions, and the two differ from one another in this respect just the way exclusive and exceptive markers are predicted to differ from one another.

### 3.4 NPI licensing

Finally, *shika* differs from *igai* in terms of licensing negative polarity items (NPIs). As shown in (21), *shika* with the negative morpheme *-na* cannot license the NPI *nanimo* ‘anything’. This is because a sentence in which *shika* occurs entails not only the negative proposition but also the positive proposition as shown in (22). *Shika* cannot license the NPI because the positive proposition does not have a negation and the NPI is not in the scope of negation in the positive proposition.

(21) #*Daisuke-shika nanimo tabe-na-katta.*

Daisuke-SHIKA anything eat-NEG-PAST

(22) *Daisuke-shika tabe-na-katta.*

Daisuke-SHIKA eat-NEG-PAST

‘Daisuke ate and everyone except Daisuke did not eat’

However, as shown in (23), *igai* with the negative morpheme *-na* can license the NPI because a sentence in which *igai* occurs entails only the negative proposition, as shown in (24), and the NPI is in the scope of negation in the negative proposition.

(23) *Daisuke-igai nanimo tabe-na-katta.*  
Daisuke-except anything eat-NEG-PAST  
'Everyone except Daisuke didn't eat at all.'

(24) *Daisuke-igai tabe-na-katta.*  
Daisuke-except eat-NEG-PAST  
'Everyone except Daisuke did not eat'

*Shika* and *igai* do not show the same pattern as English *only* and *everyone except* because both *only* and *everyone except* with negation can license NPIs like *any* as shown in (25) and (26). In the following discussion, I treat *everyone except* plus negation as a licenser of NPIs, even though a negation itself is sufficient as an NPI licenser. This is because the purpose of this section is to compare *only* to *everyone except* plus negation.

(25) ***Only*** *his sister will expect him to write **any** more novels.*  
(Horn 2006)

(26) ***Everyone except*** *Daisuke didn't eat **anything**.*

In contrast to Japanese *shika* plus negation, which cannot license NPIs at all, some NPIs can be licensed by English *only*, as shown in (27).

(27) *Only John ever suspected David Alexander.*

*Only John kissed Mary anymore.*

*#Only I was all that keen to go the party.*

*#Only Franz will be one bit interested.*

(28) *Everyone except John didn't ever suspect David Alexander.*

*Everyone except John didn't kiss Mary anymore.*

*Everyone except I wasn't all that keen to go the party.*

*Everyone except Franz will not be one bit interested.*

In Japanese, all NPIs are licensed by the negative morpheme *-na* except for the case when *-na* occurs with *shika*. Because of this character of Japanese NPI licensing, the distinction between *shika* and *igai* is clear: *shika* with *-na* does not license NPIs at all, while *igai* with *-na* licenses all NPIs.

In English, on the other hand, the distinction between *only* and *everyone except* plus negation is more relative. Although *shika* appears to behave differently from *only* as *shika* plus negation cannot license any NPIs while *only* can license some NPIs, the range of NPIs which are licensed by *only* is smaller than the range of NPIs which are licensed by the exceptive counterpart *everyone except* plus negation. If it is the case that the less negative an NPI licenser is, the smaller number of NPIs it can license, then *only* is less negative than *everyone except* plus negation, which can license wider range of NPIs than *only*, as shown in (28).

What is important here is to show that the exclusive marker *shika* is less negative than the exceptive marker *igai* plus negation. The English exclusive marker *only* is also less negative than the exceptive counterpart *everyone except* plus negation in the sense that the range of NPIs which can be licensed by *only* is smaller than the range of NPIs which can be licensed by *everyone except* plus negation.

#### **4. Compositional analysis of the meaning of *shika***

I have argued that *shika* has semantic properties which cannot be explained if it is an exceptive marker. However, if *shika* corresponds to exclusive markers like *only*, the semantic contribution of the negative morpheme *-na* is not obvious. The problem comes from the assumption that a sentence in which *shika* occurs entails both the negative and the positive proposition. The semantics of *shika* is not straightforward since the subject of a sentence in which *shika* occurs is the one from the positive proposition, while the polarity of the predicate, which is negative, is from the negative

proposition. In (29), the subject *Daisuke* is the subject of the positive proposition *Daisuke came*, but the polarity of the predicate is of the negative proposition *everyone except Daisuke did not come*. The semantics needs a negation on the predicate of the positive proposition to make the negative predicate which co-occurs with *shika* affirmative, as shown in (31).

(29) *Daisuke-shika ko-na-katta*  
 Daisuke-SHIKA come-NEG-PAST  
 ‘Only Daisuke came.’

Semantics of (29)

(30)  $\text{came (D)} \wedge \forall x (x \neq D \rightarrow \neg \text{came (x)})$

Semantics of *shika*

(31)  $\lambda Q \lambda P \{ \neg P (Q) \wedge \forall x (x \neq Q \rightarrow P (x)) \}$

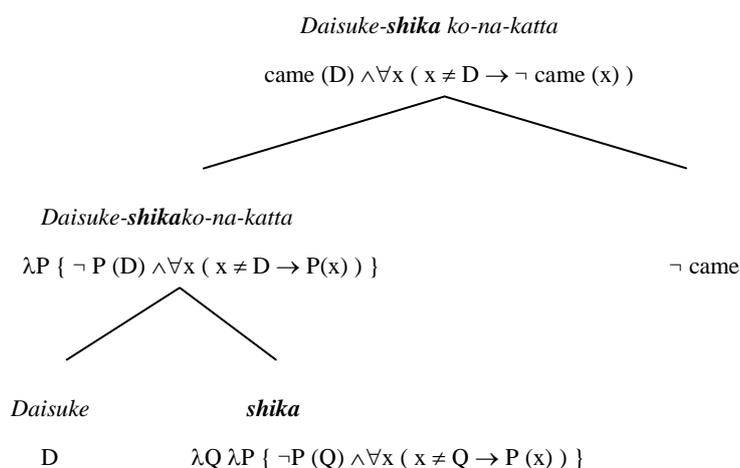

Figure 1. Semantics of (29)

## 5. Conclusion

Yoshimura (2006) analyzes *shika* as an exceptive marker such as English *everyone except*. However, her analysis fails to explain several semantic properties of *shika*.

First, *shika* behaves more like the English exclusive marker *only* than the exceptive marker *everyone except* for some semantic properties. *Shika*, like *only*, and unlike *everyone except* plus negation and its Japanese counterpart *igai*, is not downward entailing. *Shika* also shows the same pattern as *only* regarding the status of the two semantic components, the positive and negative proposition. A sentence in which *shika* or *only* occurs entails both the positive and negative proposition while a sentence in which *igai* or *everyone except* occurs entails *only* the negative proposition.

Yoshimura (2006)'s analysis that *shika* is an exceptive marker also fails to explain NPI licensing and what is focused by *shika*. *Shika* with the negative morpheme *-na* cannot license NPIs while *igai* with the negative morpheme *-na* can license NPIs. *Only* can license some NPIs but it is similar to *shika* in the sense that it is less negative than the exceptive counterpart in terms of the range of NPIs which it can license. *Shika* also behaves differently from *igai* for what it focuses on. What is focused by *shika* is either the reference set or the complement set while what is focused by *igai* is only the complement set.

I conclude that *shika* is less negative than exceptive markers such as English's *everyone except*. A sentence in which *shika* occurs does not only entail the negative proposition, but it also entails the positive proposition while the positive proposition is not a part of the meaning and just an implicature for a sentence in which an exceptive marker occurs.

## Abstract

The notions *accommodation* and *binding* of presuppositions, as used in the DRT-based framework of Van der Sandt and Geurts, are critically assessed. Examples are presented which suggest the need for a narrower interpretation of, in particular, the term *accommodation* and the differentiation between accommodation proper and the process of presupposing hearer-old but discourse-new information. The notions are applied in a proposal for a new annotation scheme for information status, which is illustrated on some examples. The significance of the scheme is briefly demonstrated in a small study into the prosodic properties of a German corpus of radio news.

**Keywords:** information status, givenness, accommodation, DRT, discourse analysis.

## 1. Introduction

This paper discusses some well-known terminology from presupposition theory following the work of, primarily, Van der Sandt (1992) and Geurts (1999). In particular, I would like to take a closer look at the notions of “accommodation” and “binding”, which have frequently been presented as a binary opposition. It is my concern to question this dichotomy but also to verify to what degree it is possible to employ the two concepts in a task that attempts to classify nominal expressions concerning their informational contribution, known under the keyword “information status” (Prince 1981, 1992). Information status theory starts out from the observation that the intuitive notions *given* and *new* are not sufficient to adequately describe the richness of referential and information structural variation found in natural language expressions. I want to argue

---

<sup>1</sup> Acknowledgement: The research in this paper was funded by the DFG German Science Foundation, Sonderforschungsbereich 732 “Incremental Specification in Context”.

that not only can we identify more than two clearly distinguishable (and information structurally meaningful) classes, but that there is, furthermore, the need for a precise formal specification; a task for which presupposition theory and Discourse Representation Theory are our tools of choice.

## 2. Binding and accommodation

The term *presupposition* has originally been understood as a pre-condition of a sentence that a context has to fulfil if the sentence is meant to be acceptable. However, already Karttunen (1974) noted that “ordinary conversation does not always proceed in the ideal orderly fashion” sketched in that sense. Whenever a presupposition is neither entailed nor excluded by the context and it is at the same time specified in sufficient detail<sup>2</sup>, hearers will accept it as if it had been asserted. Since Lewis (1979) this process of acceptance is known as *accommodation*.

The work by Van der Sandt (1992) and Geurts (1999) comprises several important advancements in presupposition theory. First of all, the clear formal specification using DRT (Kamp 1981; Kamp & Reyle, 1993) allows for a systematic comparison of the broad variety of known presuppositional phenomena, the easy discovery of hitherto unknown presupposition triggers as well as their integration into a broader theoretical framework. Secondly, a new perspective on presuppositional phenomena is introduced, viz. the analogy between presuppositions and anaphors, which is probably most convincingly argued for in the field of definite descriptions, which on the one hand have been treated as prototypical presupposition triggers, requiring the identifiability of a somehow<sup>3</sup> unique referent satisfying the descriptive content, and, on the other hand, as expressions that have a great deal in common with pronouns and are, therefore, anaphors.

But it is not only individual type discourse referents that can be approached in terms of anaphora. On the contrary, any kind of presuppositional phenomenon can be rendered within the two-stage formalism offered by Van der Sandt and Geurts, and subsequently be subjected to comparison. The two stages consist in (i) the generation of

---

<sup>2</sup> Compare „too“ for a presupposition trigger where this is not the case (cf. Van der Sandt & Geurts (2001), Beaver & Zeevat (2007), Riester (2008b)).

<sup>3</sup> Uniqueness of definite descriptions, as has been noted a long time ago, is rarely ever “global uniqueness” but requires a controlled context, which may be implicitly or explicitly defined.

a so-called *preliminary presupposition* and (ii) its subsequent *projection*, which ultimately leads to sentence-internal or -external *binding* of the presupposition (or more precisely: its discourse referent) to a referent available elsewhere in the discourse. If no antecedent referent can be found in the discourse, then, according to the standard theory, it has to be accommodated. Accommodation preferably takes place at the level of the main discourse representation structure (DRS). In the following sections, however, I will demonstrate that often there are cases which superficially look like accommodation phenomena but which are in fact better described in terms of binding and for which I will use the notion *activation*. Note that there are other uses of this term in the literature that for all I can tell describe similar as well as less similar processes; compare, Chafe (1994), Lambrecht (1994), Arnold (1998), and Beaver & Clark (2008). What is essential for me at this point is that the term semantically captures exactly the process of bringing something to attention that was there but not in the immediate centre of attention. This stands in contrast to the *accommodation* cases, which I take to establish hitherto *completely unavailable* information.

### 2.1. *Binding, accommodation and activation in DRT*

This section glances over some well-known cases of presupposition resolution in the DRT framework, pointing out some unclear issues, which are responsible for a terminological and conceptual deficit of the existing theory. Compare the following examples.

- (1) a. If John is married, his wife will be happy.  
b. If John made coffee, his wife will be happy.

In (1a), the presupposition triggered by “his wife” is bound by lexical material in the antecedent clause, whereas in (1b) it projects to the sentence level where it gets accommodated; at least, this is how the story has been told on countless occasions.

However, if we are taking a closer look, what we really can observe from the formal DRT specification (figure 1) is that the set of two presuppositions triggered by “his wife” is only *partly* found in the antecedent clause.

In figure 1 we see the preliminary DRS generated by sentence (1a). The boxes preceded by the  $\partial$  signs (Beaver, 2001) are unresolved presuppositions and correspond to the descriptive content of the possessive pronoun (male person) as well as to the possessive relation inherent to the genitive construction. The underlined discourse

referents (cf. Geurts, 1999; Kamp, 2001) differ from their non-underlined cousin in that they require anaphoric resolution.

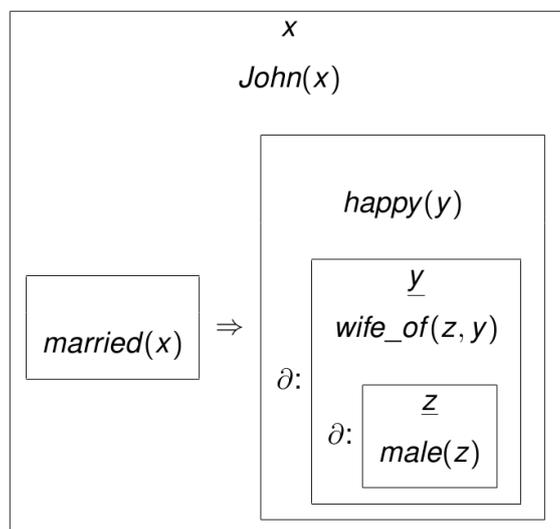

Figure 1: Preliminary representation of example (1a).

We start resolving the DRSs from the inside out. In figure 2, the inner presupposition has been projected along a path starting from its original location, via the box on the left-hand side, and up to the main level, while the discourse referent  $z$  has been bound to the referent denoting the person John.

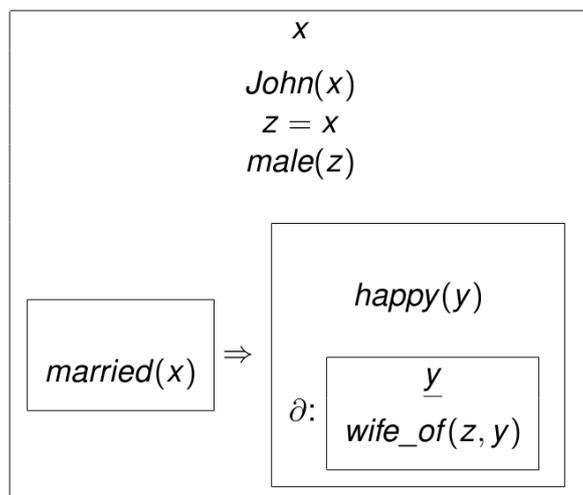

Figure 2: The innermost presupposition bound to  $x$ .

Now we try to proceed in an analogous fashion with the remaining preliminary presupposition. Intuitively John’s having a wife is what follows from his being married, hence, we would like to be able to resolve and bind the presupposition to the information contained in the antecedent box. This is not possible right away, however, because what needs to be done first is to *create* a discourse referent for John’s wife  $u$  in that box and then bind the anaphoric discourse referent  $y$  to  $u$  (figure 2b).

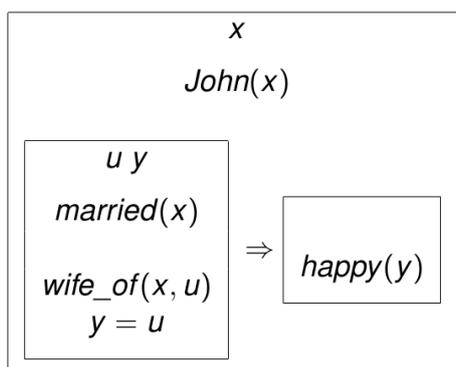

Figure 2b: Final representation of the discourse in (1a).

So, is this a process of accommodation? A mixture of binding and accommodation? I would like to argue that the process involved should not be called accommodation at all, neither are we dealing with binding in the strict sense. This case is quite different from one in which John’s wife is mentioned without previous use of the word “married” and in which the hearer doesn’t possess previous knowledge about John’s marital status. In that case accommodation is needed. But in the present case we can think of John’s wife as being uniquely available or accessible in a “marriage” scenario (figure 3), which is associated with the verb “married”.

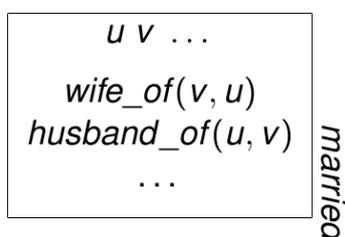

Figure 3: Simplified scenario context attributed to the word “married”.

The attribution of the property “married” to John in the antecedent of the conditional triggers this scenario and this is where the “wife”-presupposition is resolved. From the perspective of the main discourse representation, what happens is that a copy of the information associated with  $u$  is created in the left-hand box of the conditional, whereupon  $y$  will get bound to  $u$ . In order to distinguish this process terminologically from accommodation while preserving some degree of analogy, I will henceforth speak of the process using the notion *activation*.

*Activation* (definition): the process of copying information from a contextually available resource into the discourse context which did not exist there before, and binding a presupposition to this information.

## 2.2. Postponing new information

A different case is represented by the examples in (2)

- (2) a. Gerhard lives in Munich. The father of triplets is 42 years old.  
 b. I just met Fred's lawyer. She is really smart.

In both cases, we may say that the presuppositions triggered by the definite expressions in the second clause get anaphorically resolved or *bound* to the underlined expressions in the first clause. However, both cases also involve a certain degree of accommodation; in (2a) the entire descriptive content of the DP is accommodated and so is, in (2b), the information that the lawyer is a woman. The latter is shown in the transition from figures 4 and 5 (the discourse context and the representation of the second sentence of (2b)) to the integrated discourse context in figure 6.<sup>4</sup>

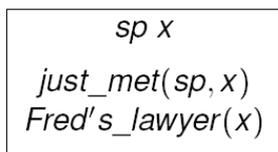

Figure 4: Discourse context after (2b-i).

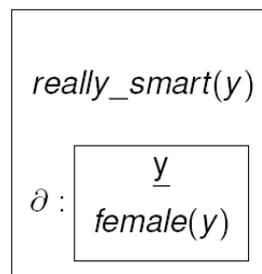

Figure 5: Contribution of (2b-ii).

<sup>4</sup> sp: “speaker”

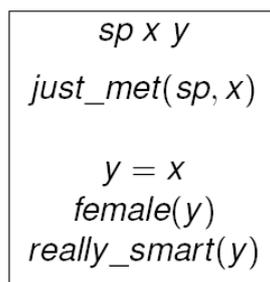

Figure 6: Integration of (2b-ii) into (2b-i).

Note that opposed to what we saw in the previous section, this is indeed a process of accommodation, as the “female” information existed nowhere except in the representation of the presupposition itself. Caveat: we could of course imagine a situation in which the sentences in (2) were spoken while it was already *common knowledge* that Gerhard had triplets or that Fred had a female lawyer although this information might not have been part of the recent discourse context. In such a situation we would have been justified to speak of *activation* once more, although the information involved would now have had to be copied from the hearer’s *encyclopaedic* (or knowledge) context (Kamp, ms; Riester, 2008a,b) rather than being taken from a special scenario.

Summary: in this section, I argued in favour of distinguishing “pure” accommodation processes from cases where a presupposition gets bound to information available in context resources other than the discourse. Such a move is desirable in order to fight an excessive – and hence confusing – use of the notion *accommodation*. Not everything which looks like accommodation from the perspective of the discourse context (for instance, in cases where seemingly new information suddenly pops up) should necessarily be given that name. This observation is already present in Geurts (1999: 84), although it doesn’t seem to have received much attention. Geurts remarked that the use of a name-like expression, e.g. “the moon”, for the first time in a conversation does not trigger accommodation on behalf of the hearer but should rather be seen as an instance of binding because the moon is not an unknown entity [unlike, for instance, “the red dwarf star Gliese 581”, A.R.]

### 3. From definiteness to information structure

#### 3.1. (De)accented definites

In Umbach (2002), we are provided with the following minimal pair of sentences in (3).

- (3) {John has an old cottage.}
- a. Last summer he reconSTRUCted the shed.
  - b. Last summer he reconstructed the SHED.

Umbach calls the object DPs “given definite” (3a) and “non-given definite” (3b), respectively, though we will see that these initially appealing terms will have to be used with great caution, as it is desirable to integrate the cases in (3) into a broader network of information status categories, which in some sense all have to do with given and new information.

It is unquestionable, however, that the prosodic difference present in the two examples corresponds with clear meaning differences, which we will now examine a bit more closely. Obviously, in (3a) “the shed” is used to refer back in a somewhat disrespectful manner to John’s old cottage. In (3b), on the other hand, “the shed” refers to an entity which is new to the discourse, and which is understood to be a different kind of building than what we have just called a cottage. Nevertheless, this new object is in some manner *related* to John’s old cottage.

In the DRT framework employed here, the contribution represented by the presuppositional expression “the shed” is in both cases the one in figure 7.

$$\partial: \boxed{\begin{array}{c} \underline{y} \\ shed(y) \end{array}}$$

Figure 7: Presupposition triggered by “the shed”.

From what we learnt in the previous section, we may again assume that different contexts play a role in resolving the presupposition. (3a) is of course the standard case of a presupposition being bound in the discourse context – compare figures 8 and 9.

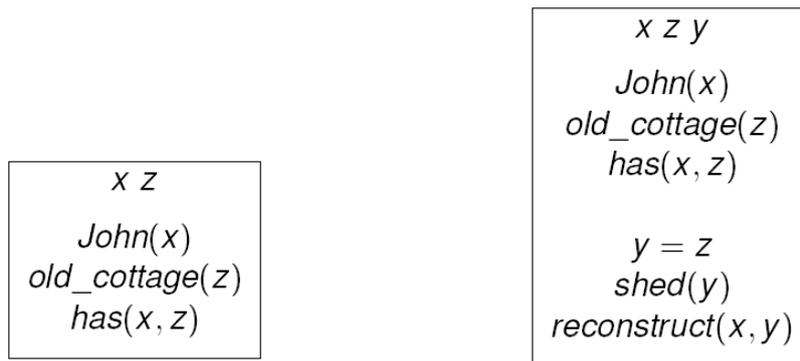

Figure 8: Discourse context before... Figure 9: ... and after integration of (3a).

(3b), on the other hand, requires what we already encountered in connection with example (1a) – the usage of a special scenario, without which the referent of the expression “the shed” remains unidentifiable. Hence, analogous to figure 3 above, I postulate the use of a “cottage” scenario (figure 10), which includes a number of entities prototypically associated with cottages – for instance a shed for storing tools.

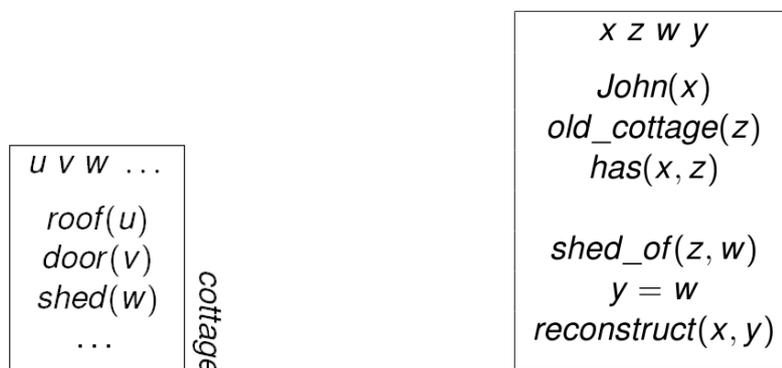

Figure 10: Scenario “cottage”. Figure 11: Integration of (3b) into discourse context using activated information.

As in the abovementioned case, we expect the relevant piece of information [*w*: *shed(w)*] to be copied (activated) from this “cottage scenario” into the discourse context where it can serve as the antecedent binding the anaphor.

### 3.2. Focus

An immediate complaint against the story just presented might be that the influence of focus has been completely neglected. Indeed, from what we know about focus since Selkirk (1984) and Rooth (1985, 1992) we should expect the accent on “SHED” to generate a focus feature in the syntax. The focus, then, triggers a presupposition to the effect that a set of alternatives must be identified. We certainly don’t seem to be on the wrong track if we assume that the set of alternatives triggered by the focus in (3b) consists of just the kinds of elements that we already postulated as being part of the “cottage” scenario in figure 10.<sup>5</sup> Hence, why wasn’t focus mentioned in the previous section?

This has to do with the more general perspective intrinsic to the annotation task that we are adopting. When labelling written text, accenting information as exemplified in (3) is usually not available. Nevertheless, the reader of a text is forced to make choices like that between the interpretation of “the shed” in (3a) and (3b) again and again. For the most part, it is contextual information provided by the text that enables such choices. Compare the discourses in (4a) and (4b).

- (4) a. When John set out to repair his old cottage he started with the roof, then went on with the shed and finally painted the façade in a lovely mint green.
- b. John inherited an old cottage, but quite frankly it was in such a bad shape that his first impulse was to tear the shed down and sell the land to a fast-food chain.

What is most directly available in ordinary text is the information status of the nominal expressions contained in it, not necessarily the focus-background structure of the sentences, although clues for the latter are also sometimes available (Riester, 2008b) and although information status (givenness) is, of course, not independent of information structure (Schwarzschild, 1999). Nevertheless, when analysing text, the first thing we should do is to ask the question in what sense the terms occurring in it are given. This is a feasible enterprise that we shall address in the next section.

---

<sup>5</sup> This would mean to postulate an *implicit* contrast between equal siblings such as “the shed”, “the roof” etc, which are all, in some sense, parts of one and the same cottage. Another way to interpret the example is to assume an *explicit* contrast between “the shed” and “the cottage”. The contrast, in that case, involves elements from a (mereological) *scale*.

*Focus*, on the other hand, is a highly theory-loaded concept, which cannot be annotated as easily. We possess by now an impressive body of ideas that describe what the core features of focus are, cf. Beaver & Clark (2008). Nevertheless, there is still no consensus with regard to the question how many different (prosodic or morphosyntactic) realisations of focus there are (or whether this is can actually be a matter of counting at all). Quite certainly, there is not just a unique “focus accent”, but contextual features – among which information status but also different types of contrast – are likely to influence how focus is realised prosodically. Calling “the SHED” in (3b) a focus is therefore not wrong but unfortunately a bit too simplistic.

As a resume, using capital letters to represent focus is an acceptable way for a linguist to indicate where s/he wants a focus to be located (mostly, in an isolated sentence or well-controlled discourse) but if our long-term goal is to investigate the prosodic details based on a finer-grained semantic classification of information status, then, in this connection, focus semantics (e.g. in terms of alternatives) is simply of no help.

## **4. Information status revisited**

### *4.1. Terminology*

Recently, there has been an increased interest in the question of how to annotate information status. In Riester (2008a), I have compared my own approach to the frameworks provided by Nissim et al. (2004), by Götze et al. (2007) and to the “classical” approach by Prince (1981, 1992).

The approaches have more or less in common that all of them provide information status labels for expressions that refer back to material that is available in the previous discourse (*discourse-given, old, given, textually evoked*), in the hearer’s knowledge context but not in the discourse (*generally accessible, generally mediated, unused*), in the speaker environment (*situative, accessible-situation, mediated-situation, situationally evoked*) as well as material that can be inferred from the previous discourse without being coreferential (*bridging, accessible-inferred, mediated-inferred, inferable*). Also problematic is the label *new*, which is sometimes used to only describe (certain) indefinite expressions but in other cases to also cover definite expressions referring to known persons or places that occur in a discourse for the first time; compare the label *new-unused* in Prince (1981). The reader may verify that this issue is very closely

related to the problem I discussed in section 2.1 regarding the insufficiently delimited use of the notion *accommodation* in cases where information is addressed that is discourse-new but hearer-old (see also Riester 2008b).

#### 4.2. *The classification*

The information status taxonomy employed in Riester (2008a,b) is grounded in formal semantic theories of presupposition and discourse. While partly (though not entirely) compatible or overlapping with previous approaches, it offers a reanalysis of information status which can be summarized as “*information status categories (at least for definites) should reflect the default contexts in which their presuppositions are resolved*”. There should consequently also be a category for expressions that cannot be bound but must be accommodated. The default contexts that we are assuming are the discourse context, the environment context (Kaplan, 1989), the encyclopaedic context of the hearer (Kamp, ms.) as well as scenario contexts like the ones introduced above in sections 2.1 and 3.1. In a current project a corpus containing about 3000 sentences<sup>6</sup> from transcriptions of recorded German radio news bulletins has been annotated according to the scheme presented in Riester (2008a,b), briefly repeated below. The annotation tool we used was SALTO (Burchardt et al. 2006).

##### 4.2.1. *Environment context*

Expressions that refer to items within the environment context (deictic expressions such as “today”, the discourse participants, demonstratives referring to objects in the speaker situation and so forth) receive the label *situative*. An example is shown in figure 12.

---

<sup>6</sup> The radio corpus described here was recorded half-hourly during three consecutive days. Necessarily, it contains many repetitions of the same news features. Those repetitions were skipped during the annotation process as were the weather forecasts.

be-accommodated) and known (activatable) entities is possible. The respective labels we are using are *accessible-via-description* (figure 14) and *accessible-general* (figure 15). Underspecification or ambiguity can be represented by assigning both labels at the same time and by ranking them.

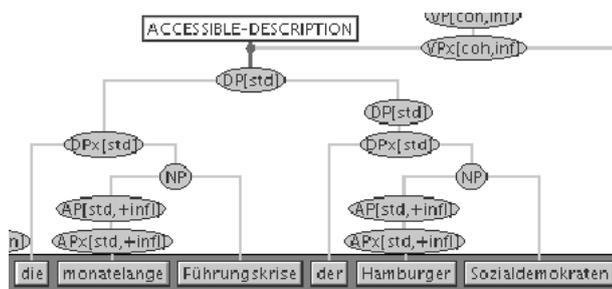

Figure 14: “the leadership crisis lasting for months among the Hamburg social democrats”

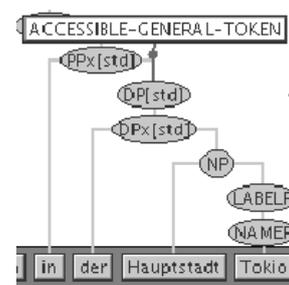

Figure 15: “in the capital Tokyo”

#### 4.2.4. Discourse context

In the scheme employed here, as in most others, discourse givenness is understood as being equivalent to coreference. This is not entirely uncontroversial, especially if the concept is to be generalised from referential phrases to words. For our purposes, however, coreference provides the strong advantage of logical clarity. The scheme distinguishes several subclasses of discourse givenness, four of which I will list below.

4.2.4.1. *D-given-pronoun*. This is the label attributed to entities referred to by a pronoun.

4.2.4.2. *D-given-repeated*. Whenever an entity is picked up again using literally the same string as before (e.g. Fred ... Fred) its second mention will receive this label.

4.2.4.3. *D-given-short*. This label is used for shortened forms of previously mentioned items. Example: Federal Chancellor Angela Merkel ... Merkel.

4.2.4.4 *D-given-epithet*. We are using this label to mark examples involving referential binding combined with accommodation of descriptive material like the one discussed above in section 2.2, repeated here.

- (2) a. Gerhard lives in Munich. The father of triplets is 42 years old.

Epithets are, traditionally, postponed descriptions, nicknames or titles of honour conventionally given to persons from history or legend, such as in “Alexander the Great” or when Homer uses the phrase “the horse tamer” to refer to the Trojan prince Hector. Our use of the term *epithet* is, however, technically defined as an expression which is on the one hand anaphoric but on the other hand introduces new information, which is not necessarily the case for many classical examples.

In integrating this term into our information status vocabulary, we therefore perform a slight meaning extension, which enables us to capture a previously insufficiently described linguistic phenomenon. The category label *d-given-epithet* replaces the earlier proposal *d-given-synonymous*, which we used previously and which was criticised by several commentators as terminologically inappropriate.<sup>7</sup> Synonyms are lexical terms that have the same meaning (*Sinn*) and can generally be exchanged for each other. While in (2a) “Gerhard” and “the father of triplets” refer to the same entity and, hence, in some sense do have the same meaning (*Bedeutung*), they can hardly be called synonyms.

#### 4.3. Labelling semantic examples

To round up the discussion from above, here is an overview on how the examples described in this paper would get classified using the proposed labelling scheme.

- (1) a. If John is married, [bridging [d-given-pronoun his] wife] will be happy.  
       b. If John made coffee, [accessible-via-description [d-given-pronoun his] wife] will be happy.
  
- (2) a. Gerhard lives in Munich. [d-given-epithet The father of triplets] is 42 years old.  
       b. I just met Fred’s lawyer. [d-given-epithet/d-given-pronoun <sup>8</sup>She] is really smart.
  
- (3) {John has an old cottage.}
  - a. Last summer he reconSTRUCted [d-given-epithet the shed].
  - b. Last summer he reconstructed [bridging the SHED].

---

<sup>7</sup> „Epithet“ is a spontaneous proposal by Larry Horn (p.c.) who was among those to criticize the use of “synonymous” in the described cases.

<sup>8</sup> As happens from time to time in the area of discourse givenness, several labels can apply simultaneously. The SALTO tool allows for ambiguous labeling in such cases.

#### 4.4. A glance at prosody

A text labelled for information status is particularly well suited for investigations into formal characteristics such as prosody or constituent order. In work which is currently being done at the Institute for Natural Language Processing in Stuttgart, we are investigating phonological and phonetic properties of the spoken realisations corresponding to the transcribed radio text (Schweitzer et al. 2008).

In a smaller corpus consisting of 500 sentences, whose spoken realisation was independently annotated for pitch accents according to the (G)ToBI scheme (Mayer, 1995), we had a look at the last accentable syllables of all expressions labelled for information status (only unambiguous ones). While we did not detect exclusive correspondences between IS labels and pitch accent types, we found significantly different distributions of pitch accents (or their absence) between, for instance, the categories *accessible-via-description* and *accessible-general*. Table 1 shows, for instance, that L\*H is by far the most frequent accent in the *accessible-general* category whereas the pitch accents found for *accessible-via-description* are more evenly distributed.

GToBI accent	accessible-via-description	accessible-general
H*	6	2
HH*L	0	1
!H*L	5	1
H*L	7	14
L*H	11	56
L*!H	4	1
L*HL	1	2
NONE	17	9

Table 1: Pitch accent distributions for *accessible-via-description* and *accessible-general* categories.

I acknowledge that that the data presented here can only provide a first impression. Investigations on a larger scale are on the way.

## 5. Conclusion

In this paper, I have tried to argue, on the one hand, in favour of a formally more stringent and detailed classification of information status and on the other hand for a more careful use of the term *accommodation*. While a lot of work remains to be done, I hope to have given the reader some impression of the possibilities that a formally rigid annotation scheme applied to natural language data may offer. While a lot of research has already been conducted on the prosodic properties of *focus*, we are only beginning to understand that *information status* has its own reflexes in intonation<sup>9</sup>. I would like to end with two open questions that I think should be addressed soon.

1. Where in a phrase is information status prosodically marked? (Note that the results in section 4.4. only pertain to the last accentable syllable but there is obviously a lot more going on in the course of the entire phrase.)

2. How can we get a grip on the distorting prosodic influence of *contrast*, which is not fully captured by annotations of information status in written text?

# Stress and Strength by Clitics in Slovenian\*

Boštjan Dvořák

## I. Introduction

*Whereas within a big majority of languages with any difference between the strong and weak pronouns (like in the southern Slavic) as to their use and occurrence, clitic pronouns show a rather regular behaviour according to syntactic rules and phonological dependencies, the situation in Slovenian may be considered as extremely different in that they not only do not necessarily follow the respective clitic properties, but even obviously contradict them. With their ability of being used as short answers (1) or stressed for contrastive purposes (2), Slovenian pronominal clitics demonstrate a set of crosslinguistically rare peculiarities concerning position (Franks 2000, Bošković 2001), stress and use (Dvořák 2003), not only functionally unusual but even in opposite to the most definitions of what clitics are in general.*

- (1) A: A ga poznaš?  
Q CL.3.m.ACC know2.SG.PR  
'Do you know him?'  
B: Ga.  
CL.3.m.ACC  
'I do.'

- (2) Slišim TE, vidim Te pa NE.  
Hear1. SG CL.2.SG.ACC see1. SG CL.2.SG.GEN PART. NEG.  
'I (do) hear, but I don't see You.'

*Thus, the definition of them as being "clitics" represents a serious problem, since this term associates them with a certain group of properties typical for this category of words in general, but not necessarily obligatory for this group of words in Slovenian. The present contribution aims to show both a general presentation of such typologically untypical, but typically Slovenian clitic occurrences, in association with some of the concomitant phenomena, as well as to present an attempt to explain their unusual development on the base of the consequent functional difference between the "weak" and the "strong" pronouns, which seems to be an essential condition rather than a contradiction. It is claimed that the stable functional role enabled this group of words to accept some additional grammatical functions, regardless of their primary origin.*

Although there are quite some considerably deep and extensive considerations about the special character of Slovenian pronominal clitics, mainly in comparative studies, as being in opposite, or, at least unusual in comparison to those of the closely related neighbouring languages (Franks 2000, Golden & Sheppard 2000, Bošković 2001, O'Rourke 2004) and even with some justified problematization of the term »clitic« (Peti-Stantič 1993 and latter) in this context, specially concerning the clitic position in Slovenian and the kajkavian Croatian, there is still no general overview of the exciting anomalies of clitic use and associated details given or possible in Slovenian in this relation, nor can we point to a reliable explanation for

---

\*The present contribution is a synopsis of the data presented at the CIL 18 Parallel Session on Information Structure in Seoul. I would specially like to thank to the organizers for including the contribution into the programme and to the audience for its constructive discussion.

the special development of the phenomenon described as »clitic predicatisation« in Dvořák 2003 or »Ga-ga Ellipsis«<sup>1</sup> in Dvořák/ Gergel 2004. Some of the most essential peculiarities of these object clitics and their use will be given therefore, and at the same time we will try to fill the gap for a valid explanation of these, in most points of view, comparably abnormal functions.

## II. Constraints and fields of use

### A) Short Answers<sup>2</sup>

Among the special fields of clitic use situations in Slovenian, that of the short answers by object clitics surely represents the richest, or at least the most striking one; they may occur after nearly any polar question containing a transitive construction of the type shown in (1), provided that the predicate is in the present tense. The other general condition for their occurrence is associated with the category of case; they do most frequently appear as accusative (1) and dative (3), but can also, though to a much minor frequency, be noticed as genitive clitic pronouns (4);

- (3) A: *A mu verjameš?*  
 Q CL.3.m.DAT believe2  
 ‘Do you believe him?’  
 B: *Mu.*  
 CL.3.m.DAT  
 ‘I do.’
- (4) A: *A ne popije dovolj vode?*  
 Q NEG. drink3 enough water. GEN  
 ‘Doesn’t (s)he drink enough water?’  
 B: *Je.*  
 CL.3.f.GEN  
 ‘(S)he does.’

The combination of the components tense and case represents a very simple and wide spread frame. However, there are some additional restrictions and special facilitating conditions to be mentioned in the use of such clitic answers. They will be listed in the following as separate points, some of which are also often to be considered as connected factors in certain domains.

1.) First, a clitic answer tends to occur after a question or another foregoing context, where the same object already occurs in the form of that clitic; if it is mentioned overtly, the same type of answer does mostly not sound acceptable any more – and the answer expressed by the clitic automatically changes from a declarative to an assertive one, according to a retrospective reinterpretation of the foregoing question from a standard to a dubitative one;

- (5) A: *A poznaš Boruta?*  
 Q know2.SG.PR B. ACC

<sup>1</sup> The expression “Ga-Ga-Ellipsis” (short: GGE) is another term for the “Predicatisation of Clitic Pronouns” (short: PCP), used in joint work with Remus Gergel (2004); it was inspired by the fact that *ga* (CL.3.m.ACC) shows the highest frequency among the words of this taxonomy.

<sup>2</sup> This field represents a type of *yes*-substitution occurring in several ways in different languages (illustrated in Dvořák 2003).

‘Do you know Borut?’

B: #*Ga*.  
CL.3.m.ACC  
‘(But) I do.’

B': *Poznam./ Ja*<sup>3</sup>.  
know1.SG.PR/ YES.  
‘I do.’/ ‘Yes.’

The expected positive answer in this case would be the verb, as given in B'. Similarly, the full verb is not impossible, but stylistically worse than the object clitic in cases like (1);

(1)' A: *A ga poznaš?*  
Q CL.3.m.ACC know2.SG.PR  
‘Do You know him?’

B: *Ga*.  
CL.3.m.ACC  
‘I do.’

B': #*Poznam*.  
know1.SG.PR  
‘I do.’

Though the possible use of isolated clitic pronouns covers a relatively broad area with respect to the general frame, where they usually represent a stylistic alternative for the positive answer “yes” in a polar context, there is a very special field of applicability, where their use is functionally stable and even most economical, when compared with any other kind of positive answer: that of an assertive function after a negated polar question.

2.) *The degree of specificity* is not entirely decisive, but plays an evident role for the acceptability of clitic answers<sup>4</sup>; the more specific resp. concrete an object is, the more it is likely for a speaker to use the clitic, whereas verbs generally fit better in cases where the object referred to is less specific; thus, in the following example referring to drinking wine the speaker uses the clitic when pointing to a bottle placed in front of himself, but prefers using the verb when drinking wine is associated with a general characteristic of a person;

(6) a) A: *Ne piješ tégale vina?*  
Neg. drink2 dem wineGen  
‘Don’t You drink that wine (here)?’

B: *Ga./ Ga, ga./ Sevéda ga.*  
It./ (redupl.)/ of course it.  
‘I do./ I do, I do./ Of course I do.’

b) A: *A ne piješ vina?*  
Q neg. drink2 wineGen  
‘Don’t You drink wine?’

B: *Pijem.* B' #*Ga*.  
Drink1 It.  
‘I do.’

<sup>3</sup> Ja, the Slovenian word for “yes”, can always be used as well, though it is not always the most elegant answer, stylistically.

<sup>4</sup> I would like to thank here Hans-Martin Gärtner from the ZAS, who has stimulated me to the experiments concerning this question.

3.) According to the above mentioned frame conditions it should be expected that the phenomenon is purely syntactically licensed and can occur after any transitive construction, but the verb *imeti* (to have) clearly indicates a further semantic constraint as well, as it completely excludes any kind of clitic answers. This exception is even more unusual, since *imeti* does not represent any auxiliary or differently used verb in Slovenian; however, it can be assumed that the amount of the components like transitivity or/and activity given in such sentences is not sufficient for the construction with this verb;

- (7) A: *Tole je moja hiša, ki*  
 DEM.n be3 POSS1f house REL  
 ‘This is my house, which  
*je včeraj še nisem imel.*  
 CL.3.f.GEN yesterday yet NEG.AUX1 ppam  
 I still didn’t have yesterday.’
- B: \**Danes pa JO. (Danes jo pa IMÁŠ.)*  
 Today PART.but CL.3.f.ACC  
 ‘But today you have it.’

Since possession is often indicated by verbs meaning *to be* and there is a lack of definiteness graduation in situations, where *iméti* is used, cases with definite objects like *hiša* in (7) are not as easy to find as with other transitive verbs (partly connection with 2.)); another speciality of *iméti* is its completely aspectless character (see further points). Any other transitive verb, even those with the same meaning, as *posedovati* e.g., do well within the construction;

- (8) A: *Tole je moja hiša, ki*  
 DEM.n be3 POSS1f house REL  
 ‘This is my house, which  
*je včeraj še nisem posedoval.*  
 CL.3.f.GEN yesterday yet NEG.AUX1 ppam  
 I still didn’t possess yesterday.’
- B: *Danes pa JO.*  
 Today PART.but CL.3.f.ACC  
 ‘But today you DO.’

No other evidence can surprisingly be found for a significant influence of what could be described as the activity degree of a transitive verb, on this phenomenon, since verbs clearly denoting non-active predicates like *poznáti* (to know) in (1) do not show any difference from those referring to obviously active acts like *povabíti* (to invite), in this respect – nor can a corresponding contrast be traced from such evident contrary pairs as *glédati* (active, to watch) and *vídeti* (passive, to see), the meaning of which is even too passive in Slovenian to allow an imperative form (\**vidi!*<sup>5</sup>), or *poslúšati* (active, to listen, *poslúšaj!*) and *slíšati* (passive, to hear, \**slíši!*). It is thus claimed in Dvořák & Gergel (2004) that the peculiarity connected with *iméti* should be interpreted in the frame of the more general set of semantic characteristics associated with the verb *to have* in a crosslinguistic view<sup>6</sup>.

<sup>5</sup> Though, this is quite possible in the closely related Croatian (e.g.: *Vidi ga!* ‘Look at him!’), and, due to some influence, also in a few adjacent areas of the Slovenian.

<sup>6</sup> Dvořák & Gergel 2004 associate this question with Kayne’s (1993) comparative study.

Similarly to *iméti*, Slovenian modal verbs also exclude pure clitic answers; they always require the presence of the same (repeated) modal verb form, which can be, and often is, combined with the according clitic pronoun, as e.g. in (9), (10) and (11);

- (9) A: *A ga móraš povabíti?*  
 Q CL.3.m.ACC must2.SG.PR INF.invite  
 ‘Do you must invite him?’
- B: *\*Ga./ Móram./ Móram ga./ Ga móram.*  
 ‘I must.’
- (10) A: *A mu ne móreš verjéti?*  
 Q CL.3.m.DAT NEG be able2.SG.PR INF.believe  
 ‘Can’t you believe him?’
- B: *Lahkó mu./ Mu lahkó./ Lahkó./ \*Mu.*  
 ADV.easily CL.3.m.DAT ADV.easily  
 ‘I can.’
- B’: *Ne mórem mu./ Mu ne mórem./ Ne mórem.*  
 NEG be able1.SG.PR CL.3.m.DAT NEG be able1.SG.PR  
 ‘I can’t.’

The modalized adverbial particle *lahkó* (easily), replacing the verbs *móči* (to be able) and *sméti* (to be allowed) in declarative use, as shown in (10)B, represents a borderline case, as far as it still may partly be understood as an adverb of manner by speakers<sup>7</sup> (11)B (as indicated by the segmentation in „*Mu. Lahkó.*”), whereas the full modal is used in negated sentences only, as in B' in (10) and (11).

- (11) A: *A mu lahkó verjámem?*  
 Q CL.3.m.DAT ADV.easy believe1.SG.PR  
 ‘Can I believe him?’
- B: *#Mu./ Lahkó./ Lahkó mu./ Mu lahkó./ Mu. Lahkó.*  
 ‘You can.’
- B’ *Ne móreš/ sméš mu./ Mu ne móreš/ sméš.*  
 ‘You can’t.’/ ‘You shouldn’t.’

The clitic pronoun *mu* in (3), (10) and (11), as well as *ga* in (1) and (9) refer to a singular referent of masculine gender, already known from some foregoing context; it is the short or weak form of the pronoun, generally used in contexts of known, not emphasized reference. If the reference is semantically emphasized, as is the case after a wh-question, when an object is being introduced into the context, the strong form of the pronoun, namely the tonic *njêmu* (12) resp. *njêga* (13) has to be used;

- (12) A: *Kómu verjámeš?* (13) A: *Koga kličeš?*  
 Wh believe2 Wh whom call2

<sup>7</sup> It could be speculated therefore about the role of those constructions for the evolving of the present phenomenon, as in *lahkó ga* the former adverb *lahkó* is really felt and can be interpreted as a verb by the speakers – and would thus represent a normal, non-elliptical construction.

‘To whom do you believe?’

B: *Njêmu.*  
PRON.3.SG.DAT  
‘To him.’

B’: \*Mu.

‘Whom do you call?’

B: *Njega.* B’: \*Ga.  
PRON.3.SG.ACC  
‘Him.’

This functional difference between the clitic and the tonic pronouns remains stable and strict in Slovenian, with any kind of mergence leading immediately to an ungrammatical construction. But nevertheless, what is officially called and – with respect to this functional difference – should be interpreted as clitic pronouns, can generally serve as positive answers after a polar question, standing alone, as seen in (1), with *ga*, or in (2), with *te*, or in (3), with *mu*, or in (4), with *je*, and in (8), with *jo* being but some of the various forms of the whole set shown in table 1 and 2 representing the Slovenian pronominal system;

Table 2: The same forms of reflexive pronouns are used for all numbers and persons.

The weak pronouns can and mostly do, but need not necessarily differ from the strong ones; in some cases the two pronominal forms are identical. However, the functions to be called “tonic” and “clitic” always stay separated, as will be shown in latter examples (see 39 below).

## B) Stress and Strength Relations

The second important fact about the possible use and behaviour of these (originally) clitic forms is shown in the example (2) at the beginning of this contribution; they are often or even usually stressed in cases where the stress occupies a full or an auxiliary verb in „normal“ languages, i.e. mainly for the purpose of strength expression. This behaviour could be interpreted, in some points, on the base of the syntax-phonology interface, since the position of clitic elements and auxiliary verbs in the past tense shows an exception for the 3<sup>rd</sup> person Sg subjects<sup>8</sup>, where the auxiliary is stressed (14’), instead, as with all other persons and numbers, the clitic; but in the present tense, the clitic pronouns represent an entire set again, with the common ability to overtake stress for strength purposes (15), (16), (17);

- (14) *Slišal sem TE, videl pa NE.*  
hear.ppa.m. AUX.1 CL.2.SG.ACC see.ppa.m PART. NEG.  
‘I heard, but I didn’t see you.’
- (14’) *Slišal Te JE, videl pa NE.*  
hear.ppa.m. CL.2.SG.ACC AUX.3 see.ppa.m PART. NEG.  
‘He heard, but he didn’t see you.’
- (15) (2) *Slišim TE, vidim Te pa NE.*  
Hear1 CL.2.SG.ACC see1 CL.2.SG.GEN PART. NEG  
‘I DO hear, but I don’t see you.’
- (16) *A ME slišiš?*  
Q CL.1.SG.ACC hear2  
‘Do you REALLY hear me?’
- (17) *Pravi, da JIM verjame.*  
Say3 that CL.3.PL.DAT believe3  
‘(S)he says that (s)he DOES believe them.’

The stress bearing role for strength purposes in a sentence, as shown in the above examples, coincides well with Höhles (1992 and latter) claim of semantically rather empty material, i.e. elements with low semantic importance easily assuming stress in this relation, as being most likely to be connected with the truth content within a statement. This situation is comparable with the stress bearing modal (English *to do*) or auxiliary (German *haben*) verbs, applied in past or present tense constructions, and indeed, the object clitics in Slovenian behave very much like these verbal elements in the mentioned Germanic languages.

However, stressed clitics do non occur exclusively in Slovenian; as it is well known, in some of the Romance languages object clitics may regularly appear in a stressed final position

<sup>8</sup> This is not a specifically Slovenian, but seems to be an old and common Slavic rule; several concepts as an attempt for explanation have been presented at the “3<sup>rd</sup> Person Workshop” by Dvořák, B., Homola, P. and Migdalski, K. on January 12<sup>th</sup> 2007 at ZAS, Berlin.

as well, and this is due to the phonological structure of those languages, as far as we have to deal with predominantly iambic patterns. Such cases are known from French (18) and Catalan imperative clauses with postponed object clitics. A further example comes from Bulgarian negated sentences, in which negation of a transitive clause containing an object clitic requires the stress of this very clitic in final position as well (19);

(18) *Prends - LE!*  
 Take2 CL.3.SG.M  
 ‘Take it/ Take him!’

(19) *Az ne GO viždam.*  
 Pron.1.P.Sg. Neg. CL.3.m.ACC see1  
 ‘I don’t see him.’

But the essential difference between those cases and the Slovenian data consists in the striking fact, that the clitics in French and Bulgarian are stressed exclusively for some purely phonological requirements and only in certain positions, in accordance to the mentioned iambic syllable structure, which does not allow any other position or stress variation in the respective case, whereas in Slovenian they obviously behave quite independently of the whole sentence structure, becoming thus rather neutrally marked, autonomous words with predicative characteristics. Thus, they can stand alone (as in the case of short answers), and stressing them in normal positions within complete sentence structures becomes semantically relevant, regardless to the syntactic position;

(17') *Pravi, da JIM verjame./, da verjame JIM.*  
 Say3 that CL.3.PL.DAT believe3  
 ‘(S)he says that (s)he DOES believe them.’

(17'') *Pravi, da jim VERJAME.*  
 Say3 that CL.3.PL.DAT believe3  
 ‘(S)he says that (s)he BELIEVES them.’

As demonstrated in (17') and (17''), the stressed object clitic effects a strength relation, whereas a theme introduction is indicated by the stressed full verb (17''). In spite of the above formulated free position rule, being true of stressed clitics, the unstressed are not free at all (17'''); in primary clitic use the position is much more restricted, making evident that the free position is essentially licensed by the stress.

(17''') \**Pravi, da VERJAME jim.*  
 Say3 that believe3 CL.3.PL.DAT

This stress-dependent relation and the fact, that the clitic and the tonic function cannot merge at all (20), show clearly that the new functional roles of Slovenian clitic pronouns do not replace the old ones; they are just added to the primary functions on the base of stress and a consequent difference between the „weak“ and „strong“ pronouns.

(20) *Pravi, da NJIM verjame./, da verjame NJIM.*  
 Say3 that PRON.3.PL believe3  
 ‘(S)he says that (s)he believes to THEM./... it is to THEM that (s)he believes.’

### C) Redundant use

Admittedly, there still are some detailed areas, where the pure phonological stress is obligatory, as seen in the context with the 3<sup>rd</sup> person subjects in (14) and (14'), or where the phonological structure is relevant as well, as seen in the below listed examples, both due to the tendentiously iambic pattern in Slovenian central dialects; those cases may reveal a former stage of the latter analogically extended system, originally comparable to that in the mentioned Romance languages. But the today's general "object clitic stressing ability" represents a complete system and is due to a longer continuous development, including a perceptual change, after which the elements may be interpreted as predicates by the speakers. A further evidence for this development is the fact that object clitics often remain in a sentence even when being semantically redundant – at least from an outer point of view – for the whole statement, as is the case in negated sentences, where the negative particle *ne* bears the stress – indicating that they are seen as predicates in the context;

- (21) *V* *Braziliji* *sadijo* *butije,* *v* *Sredozemlju*  
 In Brazil.LOC plant3. PL butia. PL in Mediterranean.LOC  
 'In Brazil they plant Butia-palms, in the Mediterranean
- jih* *pa* *NE.*  
 CL.3.PL.GEN but NEG  
 they don't.'

- (22) A: *Kje* *rastejo* *butije*  
 Where grow3. PL b.PL  
 'Where do the Butia-palms grow
- in* *kakšna* *klima* *jim* *paše?*  
 and what climate CL.3.PL.DAT suit3  
 and what kind of climate does suit to them?'
- B: *Ne* *vem,* *kaj* *jim* *paše*  
 NEG know1 what CL.3.PL.DAT suit3  
 'I don't know what they like
- in* *kaj* *jim* *NE.*  
 and what CL.3.PL.DAT NEG  
 and what they don't.'

In (21) and (22), the negation particle *ne* would be sufficient for the second part of the sentence construction, but the speakers feel like the clitic pronoun, extracted from an overt occurrence or repeated from the first part of the sentence, is needed again. After a negation, any accusative automatically turns to a genitive, as in (21); however, genitive and accusative pronominal forms are identical for all persons and numbers except for f. Sg. (23);

- (23) A: *A* *jo* *poznáš?*  
 Q CL.3.f.ACC know2.SG.PR  
 'Do you know her?'
- B: *Jo.* B': *Je* *NE.*  
 CL.3.f.ACC CL.3.f.GEN NEG

‘I do.’ (“Her.”)

‘I don’t.’ (“Her not.”)

Answering by clitic pronouns is not anyway limited to a fixed repeating of forms; a certain flexibility within the set of the taxonomy is always given and easily performed by the speakers, according to the rules required for grammatical adjustment and congruity, so that a jump from one to another person (24) or even number (25) happens automatically;

(24) A: *A mi ne verjámeš?*  
Q CL.1.DAT.SG NEG believe2.SG.PR  
‘Don’t you believe me?’

B: *Ti.*  
CL.2.DAT.SG  
‘I do.’ (“You.”)

B’: *Ti NE.*  
CL.2.DAT.SG NEG  
‘I don’t.’ (“You not.”)

(25) A: *A me ne poznáte?*  
Q CL.1.GEN.SG NEG know2. PL.PR  
‘Don’t you know me?’

B: *Vas.*  
CL.2.ACC.PL (polite form)  
‘I do.’

B’: *Vas NE.*  
CL.2.GEN.PL NEG  
‘I don’t.’

#### D) Economy and special areas of use

As already mentioned above, after a negated question like in (25), the positive answer by an object clitic pronoun represents a specially economic type of answer, as it avoids the ambiguity given with *ja*, the Slovenian “yes”, in such cases. Therefore, this type of answer is specially frequent after negated transitive questions, representing proportionally the most stable field of its occurrence in spoken dialogues. In these situations a clitic answer is also most frequently obtained in experiments done about general use of clitic sentences, namely almost always – due to the fact that no other answer type would be more effective and semantically fit better into the context. Due to the foregoing negative frame the object clitic effects an answer rather comparable to the German “doch” or the French “si” than a normal “yes”, similarly to the situation provoked by its use after overt object mentioning, according to Dvořák/Gergel 2004, as shown in (5) – and illustrated again in (26):

(26) A: *A poznáte to palmo?*  
Q know2.Pl DEM palm. ACC  
‘Do you know this palm species?’

B: *#Jo.*  
CL.3.f.ACC.SG  
‘(But) I do.’

B’: *Poznam.*  
know1  
‘I do.’

When the object is overtly mentioned in a polar question, the positive answer will be usually performed by the full verb and not by the clitic. Answering by using the object clitic is still possible here – but not completely grammatical, if it should stand just for the normal positive answer meaning “yes”; when used, however, the clitic answer effects a mutation of the discourse situation with the sense of the question changing retrospectively from a normal to a dubitative one automatically, as *jo* is an assertive answer in this case. After positive

questions the clitic answers are normally found when they already occur in the same form in the question. This restriction is of no importance for negated questions; as any positive answer is at least partly assertive after a negation, the object clitic may be used independently of whether it is repeated or congruently built (27) or representing an overt object (28) in the question;

- (27) A: *A je ne poznáte?*  
 Q CL.3.f.GEN.SG NEG know2.Pl  
 ‘Don't you know it?’
- B: *Jo.* B': *(Poznam.)*  
 CL.3.f.ACC.SG know1  
 ‘I do.’ ‘I know.’
- (28) A: *A ne poznáte te palme?*  
 Q NEG know2.Pl DEM.GEN palm.GEN  
 ‘Don't you know this palm species?’
- B: *Jo.* B': *#Poznam.*  
 CL.3.f.ACC.SG know1  
 ‘I do.’ ‘I know.’

The (positive) answers by object clitics in all these situations are even essentially better than any full verb repetition (B'). This is also proved by their frequency after those questions, whereas there is seemingly a partly mismatch with the full verb answers on their place.

A two-part object like the one effected by coordination in (29) can also be expressed by the object clitic (here a dual one according to the number rules) by no impediment, just like the repetition in (30), where it is additionally doubled;

- (29) A: *A ne vidiš Boruta in Maje?*  
 Q NEG see2 Borut.GEN and Maja.GEN  
 ‘Don't You see Borut and Maja?’
- B: *Ju.* B': *Vidim.*  
 CL.3.ACC.DL see1  
 ‘I do.’ ‘I see.’
- (30) A: *Ju ne vídi?*  
 CL.3.GEN.DL NEG see3.SG.PR  
 ‘Doesn't (s)he see both of them?’
- B: *Ju, ju.* B': *Ju NE.*  
 CL.3.ACC.DL CL.3.GEN.DL NEG  
 ‘He does, he does.’ (“Both of them, 2x.”) ‘He doesn't.’

Whenever the answer clause is negated – like in (30)B', but also in the above examples (23)B', (24)B' and (25)B' – the negative particle *ne* occupies the final position in it; this final position is reserved for *ne* in declarative negated clauses in general. With a changed word order from clitic + *ne* to *ne* + clitic, the sentence becomes automatically a negated imperative, as demonstrated in (31):

(31) A: *A naj ju pokličem?*  
 Q OPT CL.3. ACC.DL call  
 ‘Should I call (the both of) them?’

B: *NE ju!*  
 NEG CL.3.GEN.DL  
 ‘You shouldn’t!’

This opposition is demonstrated in (32), where the two possible answers to a foregoing ambiguous question represent a minimal pair – with the position of *cl + ne* vs. *ne + cl*. being the only distinctive point between a declarative and an imperative clause again; any position change (with the same meaning) is ungrammatical. The question and the two answers are formally analysed in (32’)<sup>9</sup>;

(32) A: *A ji zaupam?* B: *Ji NE.* B’: *NE ji!*  
 Q CL.3.f.DAT trust.1.SG.PR CL NEG NEG CL  
 ‘Do I trust her?’/ ‘Should I trust her?’ ‘You don’t.’ ‘Don’t!’

Usually, the question after which a negated imperative (B’) is to be expected, would be built with an Optative (33). A possible scenario of clitic movement, which probably led to the above elliptic constructions, is added below in this example; here, the minimal word order opposition is effected by embedding the imperative clause (B) in (B’), as an embedded imperative shows the same order (*cl + ne*) as a declarative clause. Thus, embedding wipes out the difference between the two clause types again (33B’, 34B’).

(33) A: *A naj ji zaupam?*  
 Q OPT CL.3.f.DAT trust.1.SG.PR  
 ‘Should I trust her?’

B: *NE ji!* B’: *Právi, da ji NE!*  
 NEG CL.3.f.DAT say.3 that CL.3.f.DAT NEG  
 ‘Don’t!’ ‘(S)he says you shouldn’t.’

(B: *Ne zaúpaj ji!* B’: *Právi, da ji ne zaúpaj!*)  
 NEG trust.IMP2.SG CL.3.f.DAT say.3 that CL NEG  
 IMP.2.

(34) A: *A ji zaúpa?*  
 Q CL.3.f.DAT trust.3.SG.PR  
 ‘Does (s)he trust her?’

<sup>9</sup> I owe many thanks to Ilse Zimmermann for the check, discussion and help in the formalization of these relations in German and Slovenian sentences (32’; 44’).

B: *Ji NE.*  
 CL.3.f.DAT NEG  
 '(S)he doesn't.'

B': *Právi, da ji NE.*  
 say.3 that CL.3.f.DAT NEG  
 '(S)he says that (s)he doesn't.'

Embedded imperatives are generally possible and frequent in Slovenian (Dvořák 2005, Rus 2005); this leads to many transitive constructions with object clitics in such cases too. Finally, approximately the same elliptic structures are licensed in such clauses as in declarative sentences, with clitics consequently being able to bear the imperative meaning as well (35c); though, an object clitic can only license an imperative when embedded, but never, when standing alone (as in 35b);

(35)a) A: *ZAUPAJ ji!*  
 IMP2.SG CL.3.SG.DAT.F  
 'Trust her!'

b) A: *\*Ji!*  
 CL.3.SG.DAT.F

c) A: *Sem rekel, da JI.*  
 Aux1 say.ppa.m that CL.3.SG.DAT.F  
 'I said (that) you SHOULD.'

With the conditions given by embedded imperative constructions, a new situation field arises and we obtain very unusual and typologically strange possibilities with respect to stress and strength relations, as e.g. strength-marked imperative clauses, which were even expected to be excluded crosslinguistically (Repp and Zimmermann, pc). In Slovenian, they exist and they are licensed by object clitics (36b). In such sentences, the stress can be put on the verb (for theme introduction, 36a) or on the object clitic (for indicating strength, 36b).

(36)a) A: *Sem rekel, da ji ZAUPAJ.*  
 Aux1 say.ppa.m that CL trust.IMP2.SG  
 'I said that you should TRUST her.'

(36)b) A: *Sem rekel, da JI zaupaj.*  
 Aux1 say.ppa.m that CL trust.IMP2.SG  
 'I said that you SHOULD trust her.'

Additionally, there are some rules to be mentioned about the further possibilities in connection with the stressed clitic position within a sentence; if put on the second place after the verb, as in (37a), a kind of inner dependency can be established, very much like in declarative clauses, when the clitic is stressed, and the hearer expects a sort of opposite or a narrowing of the statement in the following part of the clause; the other position (b) is not possible, except after embedding.

(37)a) A: *Zaupaj JI, ampak ne preveč!*  
 trust.IMP2.SG CL.3.SG.DAT.F but not too much  
 'You SHOULD trust her, but not too much.'

b) A: *\*JI zaúpaj, ampak....*

Whereas the clitic pronouns can be generally distinguished from the tonic ones by appearance (with the tonic pronouns being mostly longer, 38), this is not the case with 1<sup>st</sup> and 2<sup>nd</sup> Person in Dual and Plural, where there is only a functional, but no formal difference between the two forms, as shown in (39), and the function changes during the same context;

- (38) A: *Kóga klíčejo?*  
 WH whom call. 3.PL.PR  
 ‘Whom do they call?’
- B: *Mêne./ Têbe./ Njêga./ Njó.* B’: \**Me./ Te./ Ga./ Jo.*  
 Emph. Pron. Cl. Pron.  
 Me./ You./ Him./ Her.
- (39) A: *Kómu verjámejo, a VAMA?*  
 Wh who DAT. believe3.PL Q Emph.Pron.DL  
 ‘Whom do they believe, do they believe YOU (DL)?’
- B: *Ne.*  
 ‘No.’
- A’: *Pa VAMA.*  
 Part. CL.2.DAT.DL  
 ‘But they do.’

*Vama* (CL.2.DAT.DL, „to the both of you”) is emphasized for different purposes in (39); first, its stress refers to the wh-related context, as it is an open question with A asking directly to whom they (3.PL, the people) believe, with *vama* being therefore stressed in the role of a “strong”, tonic pronoun. But, after the negation addressed by B, A’ inserts the positive statement by introducing it with an adversative particle again, aiming thus to express strength in polar context; this requires the use of the clitic pronoun. Admittedly, the adversative particle *pa* could introduce the emphasized tonic pronoun as well, but after the statement expressed by this construction has been negated, it only can refer to adversative polarity.

In negated cases the negative particle *ne* is always stressed in Slovenian, as far as the truth value of a sentence is emphasised (40, 41, 42, 43); this being negated in preceding position, a positive contrast can be effected by stressing either the clitic pronoun or the particle *pa* (which licences a big amount of contrast constructions) in final position (43).

- (40) a) *Slišal sem TE, videl pa NE.*  
 hear.ppa.m. AUX.1 CL.2.SG.ACC see.ppa.m PART. NEG.  
 ‘I heard, but I didn’t see you.’

hear1.SG.PR CL.2.SG.GEN NEG see1.SG.PR CL.2.SG.ACC PART  
'I don't hear you, but I see you.'

In the above sentences, *ne* and object clitics appear in several positions, always in a polar context, being stressed in parallel connection for the strength purposes. In past tense constructions, *ne* is prefixed to auxiliaries. Some essential rules of its behaviour – with special regard to the object clitics – may be assumed from the given examples, and listed in a short sketch<sup>3</sup>:

- There are two kinds of negation, Pol- and Strength- negation. Pol- is used in normal sentence negation. Strength negation obtains additional stress as confirmation of a statement (Repp 2006).
- CP<sub>+/force</sub> (Strength P) (Mood P) (TP) Pol P vP\* VP (Zimmerman 2006)
- *Ne* can be merged in Pol and/or in Strength.
- Clitics except *je* are moved to the left to the Wackernagel position, verbs to F<sup>0</sup>, pronouns to the adjunct position. This results to the clitic cluster order: Aux + Refl + Dat + Acc
- *Ne* is a proclitic requiring a verbal host: *ne vidim, nisem videl...* It moves together with the verb to the left periphery of the sentence, passing over the other clitics. This is a last resort movement.
- In elliptic answer statements the elision proceeds on the surface structure; thus the sentence stress can be placed on clitic formatives.
- In Strength the contrast *ne/Ø* is placed by extra accent for FALSUM/VERUM. This accent is situated in Ø on the left neighbour constituent of Strength.

As already indicated and partly commented, Slovenian facts generally fit well in Hoehles (1992) claim of the most unspecific elements overtaking easily the key role by *verum focus* constructions in biased contexts; for comparison, three German sentences are analysed with respect to strength conditioned stressing of – in the German case – auxiliary verb *haben* (to have, a) in the contrast to emphasized negation (b) and theme introduction (c), and formally analysed in (44').

- (44) a) *Es HAT hier drei Monate lang nicht geregnet.*  
It AUX.3 here three months long NEG rain.ppp  
'It REALLY didn't rain here for three months.'

missing, the meaning is clearly past, as the tense is automatically copied from the first part of the sentence (a).

- (48) a) *Danica ni razuméla predpisov, Lukrecija PA.*  
 D. n.aux ppaf ipf instructions GEN, L. PART.  
 ‘Danica did not understand the instructions, but Lukrecija did.’
- b) *Danica ni razuméla predpisov, Natáša pa JIH.*  
 D. n.aux ppaf ipf instructions GEN, N. PART.them  
 ‘Danica did not understand the instructions, but Lukrecija does.’
- c) *Anica ni povabila sosédov, Natálija PA.*  
 A. n.aux ppaf pf neighbours GEN, N PART.  
 ‘Anica did not invite the neighbours, but Natalija did.’
- d) *\*Anica ni povabila sosédov, Johánca pa JIH.*  
 A. n.aux ppaf pf neighbours GEN, J. PART.  
 them  
 ‘Anica did not invite the neighbours, but Johanca does.’
- e) *Anica ni vabila sosédov, Johánca pa JIH.*  
 A. n.aux ppaf ipf neighbours GEN, J. PART.  
 them  
 ‘Anica did not invite the neighbours, but Johanca does.’

In the sentences b) and d), *jih* (the m/f Pl Acc clitic pronoun) is added – and this effects the present tense meaning of the second part of the sentence. However, the second part of the sentence in d) is fully ungrammatical because of the perfective aspect of the verb in the preceding part. The version e) is completely grammatical again; the verb form used in it is imperfective. – This special effect is due to the simple fact that perfective verbs can generally not be used in present tense function (except when this is used in iterative meaning) in Slovenian; like in several Slavic languages, perfective verbs in present form are automatically associated with a future meaning – but this does not work with clitic pronouns.

A further interesting dimension of the predicatisation of clitic pronouns (PCP) in Slovenian is that of their occurrence in clustered groups, in which they originally appear in a strict order according to consequent priority rules, Refl + Dat + Acc; clusters may be double or triple sequences, as shown in (49) and (50). It is an amazing fact that, though being defined by a stable construction and not variable in their sequence order, they may be split by additional (e.g. adverbial material) and the single clitic elements can thus represent quite independent constituents again, as in (49)B’ and (50)C;

- (49) A: *Misliš, da mu zapeljuje ženo?*  
 think2 that CL.3.m.DAT seduce3 wife ACC  
 ‘Do you think that he seduces his wife?’
- B: *Mislim, da mu JO. / \*da jo MU.*  
 think1 that CL.3.m.DAT CL.3.f.ACC  
 ‘I think he does.’ (‘I think that him HER.’)
- B’: *Mislim, da mu kdaj pa kdaj res JO.*

think1 that CL.3.m.DAT when and when really CL.3.f.ACC  
 ‘I think he sometimes really does.’ (‘I think that him sometimes really HER.’)

(50) A: *Diplómo se mu prizná.*  
 diplomaACC CL.REFL.ACC CL.3.m.DAT recognize3  
 ‘They recognize his diploma.’

B: *A se mu JO?*  
 Q CL.REFL.ACC CL.3.m.DAT CL.3.f.ACC  
 ‘Do they?’

A: *Se mu JO, se mu JO.*  
 ‘They do, they do.’

C: *Mislím, da je pràv, da*  
 think1 that be3 correct, that  
 ‘I think it is correct, that

*se mu končno vendarle JO.*  
 CL.REFL.ACC CL.3.m.DAT finally nevertheless CL.3.f.ACC  
 they finally do (it), after all.’

There are several details to be commented in the above sentences. First, the rule formulated about PCP differences in reflecting pronominal vs. overt reference is not decisive in a clustered construction, as may be seen in (49)B; a sequence of an accusative element following a dative clitic in the question is a sufficient mechanism for a clitic cluster to arise in the answer. This does not change even when the dative clitic *mu* is replaced by an overt name, e.g. *Petru*. Second, stress seems to play an essential role in all those cluster constructions again, since the final element (usually monosyllabic) is always stressed and any other variation is impossible. The final accent rule results first in the iambic pattern of minimal parts of the clause (pa MU/mu PA; se GA; ji JO; mu JO; me NE; sem GA; ga JE etc.) and can be further expanded to the anapestic pattern in triple sequences (se mu JO; mu jo JE; sem mu JO; nama JIH; si ju JE etc.). The pronunciation of those sequences may not always be phonologically uniform; there is a variety of obligatory spelling properties, defined by minimally differing details of intonation, which can be but shortly mentioned here, but which obviously play an important role in both the realization and perception of produced speech acts by speakers, as e.g. – just to mention one of them – the fact that “*mu JO*” in (49)B is fluently pronounced without any break in the iambic step, whereas in “*mu kdaj pa kdaj /res/ JO*” in (49)B’ the adverb *res* requires an additional intonation – effecting a break – before the final accent, and a pure fluent iambic \**res JO* is not sufficient. Similarly, there is a semantic difference between a “staccato”-like *vÈndarle JO* and a “smooth” *vendarle JÒ* with respect to the strength dimension again – as well as to the question of whether it is pronounced in direct or indirect speech.

Whenever clusters are split by additional information, this can obviously only happen by inserting the material before the final step of the cluster.

### III. On origins of PCP

Whatever can be observed in the domain of clitic pronouns (and, to some extent, of all other clitic elements as well) in Slovenian, can be combined, connected and contextually referred to

independent stress rules; focussing a pronominal clitic by stressing it can license most unusual positions and functions – in a crosslinguistic view. Nevertheless, the functional difference between the pronominal clitics and their tonic counterparts always remained, and still remains, stable in Slovenian – and is even increasing compared to the situation in (Štokavian) Croatian and Serbian, where some degree of functional mergence is not ungrammatical if depending on what could be called environmental harmony requirements (51), whereas the Slovenian definition of a clitic pronoun tended to become purely functional at least after 1500 and is remaining so even in cases of morphological identity, as illustrated in (39) above. If compared with the standard Štokavian situation illustrated in (51) – when the subject pronoun is used, the tonic pronoun is better than the clitic one for the object, consequently –, the Slovenian conditions (52) seem to be essentially different;

(51) (ŠTOKAVIAN) CROATIAN/ SERBIAN

- a) *Ja njega vidim.* / *VIDIM ga.*  
 I tonic pron. see 1.SG.PRES see 1.SG.PRES CL.3.SG.ACC  
 ‘I see him.’ ‘I see him.’
- b) *#Ja ga vidim.*  
 I CL.3.SG.ACC see 1.SG.PRES  
 ‘I see him.’

(52) SLOVENIAN

- a) *Jaz ga vidim.* / *Vidim ga./Ga vidim.*  
 I CL.3.SG.ACC see 1.SG.PRES  
 ‘I see him.’ ‘I see him.’
- b) *\*Jaz njega vidim.*  
 I tonic pron. see 1.SG.PRES  
 ‘I see him.’

It is thus to expect and seems quite plausible that this very consequent functional separation was the main condition to enable the clitic pronouns to gain additional functions after some time, as it completely excluded any confusion or misunderstanding. However, the situation described and typical for Slovenian – with purely functional clitics being most probably the main condition for latter special development – is also found, at least in a certain extent, in considerable parts of Croatian language territory; specially the Kajkavian dialects (Peti-Stantić, pc) show many characteristics concerning position and use of the clitics differing from the standard rules of the today’s written Štokavian and parallel to those described for Slovenian. However, it must be admitted in this respect that the Slovenian language territory is not completely uniform either; the situation described in this contribution mainly fits for the most of the central and western dialectal area including the spoken standard language. In parts of the eastern dialectal area (Prekmurje, Štajersko) the functional separation between tonic and clitic (long and short) pronominal forms is much weaker and not as consequent as farther west; this fact may be illustrated by a well-known and popular folk song from Štajerska beginning with following verse:

- (53) a) *Óna méne ljúbi.*  
 She.PRONf PRON.1.SG.ACC love3  
 ‘She loves me.’

For the speakers of the central area, the sentence is completely ungrammatical in this interpretation, unless the object pronoun (as in the tonic form) is stressed (and semantically emphasized), meaning consequently: *She loves ME.* – but this is not the case. It is specially for its meaningful and funny ambiguity that the song is so much beloved in the whole Slovenian area, as it can be understood as meaning just the contrary, when interpreted as a grammatically correct sentence:

- b) *Ona me ne ljubi.*  
 She.PRONf CL.1.SG.ACC NEG love3  
 ‘She does not love me.’

Besides the regional alternations with their indigenous differences, the urban slang speech (as spoken in Ljubljana and elsewhere) often exhibits an opulent use of strong pronouns where the weak forms would be expected – apparently in opposite to the above assumptions; however, it must be restrictively noticed, that a stylistic (over)emphasizing of each single element of a chain is the real reason for these occurrence and not a decrease of the weak forms in general<sup>10</sup>;

- (54) A: *Jest sem teb’ že reku, de*  
 I.PRON AUX1 CL.2.SG.DAT already say.ppam that  
 ‘I’ve already said you that
- ti mene zajebavaš.*  
 You. PRON PRON.1.SG.ACC make fun2  
 you are making fun of me.’

The predicatisation of pronominal clitics and its concomitant phenomena are a stable element of today's standard Slovenian, present, actively used or at least passively intellegible in all of its areas and parts, and not about to disappear or to evolve separately; after the essential step on the path of what we now call *predicativization* had taken place, it is a firm characteristic of this language, mutually influenced by its structure and influencing it at the same time. Corresponding to the spread and density of the phenomenon<sup>11</sup>, the children normally acquire it at an early age. This is specially facilitated with some elliptically constructed interrogative sentences frequently used when communicating with little children, as the following example from a Kindergarten (Piran, 1978) demonstrates:

- (55) A: *Robi, a te<sup>12</sup> (tiščí) lúlat?*  
 R. Q CL.2.SG.ACC press3 INF.pee-pee  
 ‘Robi, do you must pee?’

<sup>10</sup> Though, some mergence (due to influence from Croatian or stemming from an older, more archaic type – with Subj.Pronoun + Object Clitic Pronoun > Strong Object Pronoun?) may be found in sentences like *Povèj ti nêmu/mên, kaj zdej misl’š.* “(Let you) say me/him, what you think now!” – To compare with Cr. *Vidi Ti njega!* (also often cited in colloquial Slovenian, for the more usual *Lej ga no!*).

<sup>11</sup> It is interesting to notice, however, that, in spite of its wide spread, the phenomenon was not payed much attention in the literature so far, and that it was rather lately observed at all; this amazing fact is probably due to a more negative attitude towards colloquial phenomena, as well as to the fact that the construction mostly occurs in rather natural, spontaneous and non-constructed speech; a further factor for this lack of evidence might have been demands on children to always answer questions in full, complete sentences...

<sup>12</sup> Since the full verb *tiščati* (to press, to urge) is generally not used, the children may acquire the *CL+Inf.* Construction very fast and early; this is evident by the introducing statements with the strong pronoun: *Tušica, mene lulat!* (Mrs. Educator, I must pee-pee!).

B: *Ja, me.*  
 Yes, CL.1.SG.ACC  
 ‘Yes, I must.’

Finally, another, at least partly connected point should be mentioned, which may have played a role and eventually additionally encouraged the spread of the PCP in Slovenian language development – that of the *relativum absolutum*, the bipartite relative pronoun<sup>13</sup>, consisting of *ki* + *clitic pronoun* for object reference, – in that it effected an additional segmentation or iambic patterned parsing of clause parts. When splitting an object relative clause, as is shown by the next example (56), by inserting some material, the stress is automatically put on the second syllable of the relative cluster, i.e. on the pronominal clitic, without a semantic effect;

(56) *Oleándrovec imá prekrásno gosénico, ki JO,*  
 oleander hawk-moth have3 wonderful ACC larva ACC that CL.3.f.ACC  
 ‘The Oleander hawk-moth has a wonderful caterpillar, that

*če imámo sréčo, jeséni nájdemo na oleándru.*  
 when have1.PL luck in autumn find1.PL ON ol. ACC  
 we can find on oleander in autumn, if we are lucky.’

Even if the evolving of this trait had no decisive influence on the formation and significant importance for the high occurrence of the PCP-phenomenon in detail, its outcome and spread after 1500<sup>14</sup> has essentially contributed to the general frequency of stressed clitic pronouns in Slovenian, the main ingredient of our construction. Several connected factors must have influenced, encouraged and affirmed the strange Slovenian verb-less clause type since then, resulting in the scarcely known, but amazing peculiarity. Let us for the conclusion listen to a conversation (57) among boys on Trubarjeva-street, from 1998, in Ljubljana;

(57)  
 A: *A Ti poznaš pol tega Petra? Jest ga*  
       *NE.*  
 Q you know2 then DEM Peter I him GEN  
 not  
 ‘Do you know this Peter then? I don’t.’

B: *Sej ga jest tud’ NE. Kdó pa misl’š, de GA?*  
 PART him GEN I also not who but think2 that HIM  
 ‘But I don’t either. Who do you think, at all, does?’

C: *Janez GA. Pa jest ga tut’, še iz vrtca.*  
 J. HIM. And I him also yet from Kindergarten  
 ‘Janez DOES. And I also do from the Kindergarten on.’

A’:  
*Tu pa tam kdó GA. Ga pa nobèn NÈ dob’r.*  
 Here and there who HIM HIM but nobody not well  
 ‘Now and then somebody does. But nobody does well.’

<sup>13</sup> The same type is also found in several other Slavic languages, as eg. older Czech and Old Church Slavonic, but is mostly dominated by the monomorphous forms; the Slovenian situation is similar to that in Modern Greek.

<sup>14</sup> An exact dating is still rather speculative, specially for different regions, but texts written by Primož Trubar seem to be good evidence for the spread of the formerly predominant monomorphous forms.

B': *Kdó ga? Kdó pa GA? Nej se jav' tist', ke GA!*  
 who him who but HIM should refl announce that who HIM  
 'Who does? Who does then? The one who does, should tell it!'

D: *Kdor GA, GA, kdor ga NE, ga pa NE.*  
 who HIM HIM who him NOT him but NOT  
 'Those who do, do. Those who don't, don't.'

A'': *Tako je. Zakvá te to zaníma, kdó GA pa kdó ga NE?*  
 so is why you that interests who HIM and who him NOT  
 'So it is. Why are you so curious about who does and who doesn't?'

B'': *ME, ke bi ga rad spoznov! No, sam', de kdó GA.*  
 ME as Kond him gladly ppam get to know well, only that who HIM  
 'I AM, as I would like to know him. Well, great that somebody does.'

C': *Ga, ga. Jest ga še kar dob'r. A ti ga predstav'm?*  
 him, him I him rather well Q you him introduce  
 'I do, I do. I do (know) him quite well. Should I introduce him to you?'

B''': *Ja! Prós'm, de mi ga!*  
 Yes please that me him  
 'Yes! Please, do that!'

# **On the variability of focus meanings**

**Dejan Matic**

Max Planck Institute for Evolutionary Anthropology  
Deutscher Platz 6, D-04103 Leipzig, Germany  
dejan\_matic@eva.mpg.de

## **Abstract**

The abundant evidence for semantic variation of focus constructions across languages suggests that focus is not a classical Aristotelian category definable in terms of sufficient and necessary conditions, but rather a fuzzy set of family resemblances. There are many possible ways to address this variability, from a universalist stance to a radically relativist position, with a number of intermediate positions between these two extremes. The present paper does not offer a ready-made answer to the question of semantic variability, but rather aims at illustrating the full range of cross-linguistic variation and at scrutinising the merits and faults of possible approaches to this variation.

**Keywords:** focus, semantics, pragmatics, linguistic relativity, linguistic category.

## **0. Introduction**

Much of the work done on focus constructions in linguistic typology rests upon the silent assumption that there exists a clear-cut cross-linguistically valid unitary focus meaning which may serve as a basis for both language description and language comparison. The primary purpose of this paper is to demonstrate that this assumption should not remain silent, i.e. that it cannot be taken for granted and needs to be subject to scrutiny. This, in turn, will be shown to have consequences for the typological research on so-called focus constructions.

In order to make my point, I will first present the standard view (Section 1) and then offer evidence for semantic and/or pragmatic variation of focus constructions across languages (Section 2). Section 3 contains an outline of possible and actual theoretical responses to this variability, while Section 4 is devoted to the assessment of these responses. In conclusion, I will try to sketch the consequences of the data presented for both typological and theoretical approaches to focus.

## **1. The universality of focus: Standard treatment of focus constructions**

The procedure usually applied in comparative and typological works on focus and in descriptions of less known languages may be roughly summarised as follows. A very general definition of focus is assumed, either an intuitively appealing description based on the notion of discourse newness, or some version of the Roothian focus semantics (Rooth 1992; see Krifka 2007 for a good overview). Then a context believed to be indicative of focus semantics is singled out. This is typically constituent questions and answers to them, where the elements of the answer corresponding to the question word in the question are widely believed to denote focus. The next step is to identify formal properties of the elements thus identified as ‘focus’ and to assume that they invariably denote the specific meaning attributed to focus. These formal properties are labelled ‘focus construction’. If a language has more than one focus constructions, they are as a rule compatible with different contexts and are therefore taken to denote different types of focus.

The typological perspective implies comparison of focus constructions in different languages in order to reduce their variability to a limited number of types. If the intention of the focus typology is purely taxonomic, the research results in an inventory of focus construction types which are attested cross-linguistically (cf. e.g. Drubig & Schaffar 2001, Elordieta 2007). If the goal of typologising focus constructions is to uncover the universal features of the human language, an attempt is made to reduce the variability of focus constructions to one single structure which somehow underlies all the different means of expressing focus across languages. More often than not, focus is transformed into a syntactic feature and thus reified (cf. e.g. É. Kiss 1998, Drubig 2007). The following quote nicely illustrates the general gist of various typological approaches to focus:

[T]he heterogeneity of (non-neutral) focus marking mechanisms attested in natural language – positional, prosodic and morphological – differ only in terms of superficial realization of an identical feature. (Kidwai 1999: 224)

Even though not all approaches are so explicit as to the universality of the semantic (and, in some cases, syntactic) feature ‘focus’ as the quote above, the simplified outline of the methodology commonly employed given in this section makes

it sufficiently clear that the posited semantic/syntactic primitive ‘focus’ is the necessary precondition for both identification and comparison of focus constructions: if there were no cross-linguistically valid grammatical category based on clear-cut semantic criteria, what the typologists compare would be basically apples and oranges. Accordingly, the assumption of the existence of the grammatical primitive ‘focus’ must result in the following prediction:

#### Focus Universality Prediction (FUP)

If there is a universal semantically based grammatical feature ‘focus’, focus constructions in all languages must:

- (a) be compatible with identical contexts,
- (b) display identical types, and
- (c) induce identical truth conditional effects.

In the following section, I will show that this prediction is not universally satisfied and investigate the consequences of this for the typology of focus constructions.<sup>1</sup>

## 2. Challenges to the universality of focus

### 2.1. *Different context compatibilities*

The first clause of FUP predicts that, for a construction to count as a focus construction, it must be compatible with contexts in which other non-controversial focus constructions are regularly used. This, however, does not seem to be universally the case: in many languages, what is identified as a focus construction on the basis of the question-answer test either covers only a subset of contexts in which focus constructions are expected to appear, or it can appear even in those contexts in which focus constructions should not appear, given the adopted definition of focus. Latter case is illustrated in example (1):

---

<sup>1</sup> Unless otherwise indicated, the data quoted in Sections 2, 3, and 4 stem either from my own fieldwork or from my native intuitions.

(1) Kolyma Yukaghir

D'ə ta:t anda: merej-dəllə šoromə-p-ki **tabud-ək** aŋsi:la:l'əl-ŋilə...

ptl so there fly-ss.perf man-pl-3.poss that-foc search-obj.foc.3pl

[A girl asks the Moon to take her up in the sky; the Moon goes down to Earth to pick her up, the girl steps on it and they fly to the sky.]

# 'When she flew away, her relatives looked for HER'

# '... it was HER her relatives looked for'. (Nikolaeva 1997: 46.21)

In Kolyma Yukaghir, a Paleosiberian language spoken in north-eastern Siberia, the combination of a direct object marked with the suffix *-ək* ('focus case') and a special agreement pattern on the main predicate ('object focus suffixes') is widely believed to be a focus construction denoting narrow focus on the object, among other reasons, due to the obligatoriness of this formal marking in constituent questions and answers to them (cf. Maslova 2003). However, in a considerable number of cases, this construction is used in contexts in which both the definition of focus and the evidence from the languages with non-controversial focus constructions would predict that the object should be treated as the topic, not as the focus of the clause. This is exemplified in (1), where Kolyma Yukaghir employs its focus construction in a context in which it is impossible to use the two canonical English focus constructions (prosodic focus and clefts).<sup>2</sup> This is a prima facie evidence for the invalidity of the first clause of FUP: an otherwise well-behaved Kolyma Yukaghir focus construction is compatible with a set of contexts which is wider than the one with which focus constructions are supposed to be compatible. We have to conclude that the semantic basis of the Kolyma Yukaghir focus construction is different from that of many European languages, i.e. that it is not a focus construction at all. But then we are faced with another problem: we must find a way to account for the fact that, despite differences, it does regularly appear in a number of contexts which are indicative of focus. The standard view of focus as a cross-linguistically valid grammatical primitive does not predict cases in which linguistic forms – in this case Kolyma Yukaghir 'focus' construction and the English focus constructions – only partially overlap semantically.

---

<sup>2</sup> Apart from the sentence given in (1), I have counted some 40-odd instances of topic-like objects encoded with the focus construction in the relatively small corpus published by Nikolaeva (1997) – see e.g. another nice example in Nikolaeva (1997: 29.19-20).

## 2.2. Different types

The second clause of FUP predicts that, if there is a universal grammatical primitive ‘focus’, the types of focus across languages should be identical. In order to evaluate this claim, consider first example (2), in which two types of focus marking in English are compared with two types of focus marking in Hungarian in a prototypical focus context, a question-answer pair:

### (2) English vs. Hungarian I: Question-Answer Pairs

- |   |                  |          |                  |              |
|---|------------------|----------|------------------|--------------|
| Who did he invite?                          | Kit              | hívott   | meg?             |              |
|   | who-acc          | call-pst | prv              |              |
| (a) ✓He invited <b>JOHN</b> . (prosodic)    | # Meg            | hív-ta   | <b>János-t</b> . | (postverbal) |
|   | prv              | call-pst | J.-acc           |              |
| (b) # It is <b>John</b> he invited. (cleft) | ✓ <b>János-t</b> | hív-ta   | meg.             | (preverbal)  |
|   | J.-acc           | call-pst | prv              |              |

The comparison of English and Hungarian focus constructions in a question-answer pair suggests that we are dealing with a simple equivalence: the prosodic focus in English corresponds to the preverbal focus in Hungarian. If this is the case, this equivalence should hold across contexts. Sentences in (3), however, exemplifying another typical focus context, correction of the Common Ground of the interlocutor, show a slightly different picture:

### (3) English vs. Hungarian II: Corrective utterances

- |   |        |          |     |            |
|---|--------|----------|-----|------------|
| (a) ✓It is <b>John</b> he invited, not Tom. (cleft)       |        |          |     |            |
| (b) ✓ <b>János-t</b> hív-ta meg, nem Tamás-t. (preverbal) |        |          |     |            |
|   | J.-acc | call-pst | prv | not T.-acc |

In a corrective context, the Hungarian preverbal focus does not correspond to the prosodic focus in English, as in question-answer pairs, but rather to the cleft construction. Table 1 gives a rough schematic representation of this:

English	prosodic focus	cleft
Hungarian	postverbal focus	preverbal focus

Table 1: English and Hungarian focus constructions

Obviously, the preverbal focus construction in Hungarian covers a range of semantic/pragmatic functions which cross-cuts the division of labour of the prosodic focus and the cleft construction in English. Again, as in the case of Kolyma Yukaghir, the hypothesis of the existence of the universal grammatical primitive ‘focus’ does not seem to be able to cope with this type of variation. If a simple semantic core (or a syntactic feature derived from it) is supposed to trigger the use of a set of constructions cross-linguistically, then this semantic core should be either invariable or vary along identical lines in all languages. Since this is obviously not the case in Hungarian and English, the second clause of FUP must also be considered invalid, at least in its universalist reading.

### 2.3. Different truth-conditional effects

Finally, if focus constructions are invariably defined by the same semantic core, they must be expected to trigger identical truth-conditional effects (third clause of FUP). Since focus-sensitive items are the standard test case for the truth-conditional impact of focus, I will use one example of (the lack of) association with focus to demonstrate cross-linguistic variation in this domain. It is a well known fact that items like *only* or *even* function as operators scoping over the set of focus-defined alternatives. Thus, in the sentence ‘The man is adding only SALT’, *only* takes the set of alternatives to ‘salt’ and quantifies universally over them; the particle has to be associated with focus and cannot be interpreted independently of it (with some well-defined exceptions; see Beaver & Clark 2007 for a more elaborate account). Examples (4) and (5) illustrate how the restrictive clitic =*t(A)kAn*, roughly corresponding to *only*, functions in Even, a North Tungusic language of north-eastern Siberia:

- (4) Ah̄i ulku-d-de-n, ńari=**dm̄ar=takan** tak-ŭ ne:-d-ni.  
 woman stir-prog-nfut-3 man=foc=only salt-acc put-nfut-3  
 ‘The woman is stirring, and only the MAN is adding salt’.
- (5) Ah̄i ulku-d-de-n, ńari=**dm̄ar** takŭ=**tkan** ne:-d-ni.  
 woman stir-prog-nfut-3 man=foc salt=only put-nfut-3  
 #‘The woman is stirring, and the MAN is adding only salt’. (not a second instance focus!)

The clitic particle =*d(A)mAr* can be used in question-answer pairs and it often occurs in corrective contexts, which makes it a good candidate for a focus construction.

In (4), it interacts with the restrictive clitic  $=t(A)kAn$  in exactly the same way the English prosodic focus interacts with the particle *only*. In (5), however,  $=t(A)kAn$  is interpreted independently of  $=d(A)mAr$ , and that in a clause which does not represent a second instance utterance. If  $=d(A)mAr$  is really to be considered a focus marker, then this is another serious problem for the approach which assumes a universal focus semantics.

#### 2.4. Possible conclusion I: Focus is not universal

What the data presented in examples (1) to (5) demonstrate is that Focus Universality Prediction is not satisfied in any of its clauses, i.e. that cross-linguistically, focus not only does not correspond to a single, unified meaning, but it actually does not seem to represent an Aristotelian category, definable in terms of necessary and sufficient conditions. The conclusion is thus that what is called ‘focus’ seems to be merely a set of partial overlaps of certain linguistic structures lumped together because of the general feeling that they somehow convey some kind of emphasis. In other words, focus is not universal.

### 3. Salvaging the universality of focus

In what follows, I am going to sketch a possible way out of the pessimistic conclusion reached in Section 2.4. The first step is to uncover one further tacit assumption in the research on information structure, which I will label *contextual determinism*. Against this background, two possible remedies for the universality of focus will be presented.

#### 3.1. Contextual determinism

The basic diagnostics for determining whether a construction denotes focus or not is, as mentioned above, its applicability/obligatoriness in question-answer pairs. This methodological procedure is based on two premises, of which the latter is as a rule simply tacitly assumed: (a) If construction  $\alpha$  is congruently used in Q-A pairs,  $\alpha$  denotes focus, and (b) Meaning is uniquely determined via context (context-to-meaning approach). Both premises have their logical consequences in cross-linguistic research of information structure: (a) If constructions  $\alpha_1$  and  $\alpha_2$  are congruently used in Q-A pairs

in languages L1 and L2, they have the identical focal meaning, and (b) If context uniquely determines meaning,  $\alpha_1$  and  $\alpha_2$  have to appear in identical contexts and display identical types.

Both remedies to be proposed in this section question the validity of this line of reasoning, though in quite different ways. I will try to show that strict adherence to contextual determinism is not justified not only from the point of view of typology, but also from the point of view of simple linguistic description of focus systems.

### *3.2. Partial remedy 1: Parametric feature variation*

One method of accounting for at least some instances of cross-linguistic variation of focus constructions is to assume that focus is indeed a universal category with a unitary core meaning, and that different context compatibilities are due to additional semantic features, specified as [+], [-] or [+/-]. This elegant solution was first proposed by É. Kiss (1998) and has gained considerable popularity (cf. e.g. Drubig 2007). The approach has a relatively simple underlying logic. When two focus constructions in different languages,  $\alpha_1$  and  $\alpha_2$ , are compared, the congruent use of both constructions in question-answer pairs leads to the assumption that  $\alpha_1$  and  $\alpha_2$  are basically identical in meaning. If  $\alpha_1$  is applicable in a more restricted set of contexts than  $\alpha_2$ , then this is the case because  $\alpha_1$ , but not  $\alpha_2$ , has the [+] specification for a feature, which restricts  $\alpha_1$ 's applicability to a subset of contexts covered by  $\alpha_2$ . The features of variation mentioned in this connection are invariably connected with the alternative semantics of focus: quantificational properties ([+/-universal], [+/-scalar], etc.), limitations on the cardinality of the focus set (binary vs. n-ary set), etc..

An often cited example of this kind of variation is Hungarian preverbal focus as opposed to English prosodic focus. It is assumed that the prosodic focus in English is not specified for the feature [exhaustive] (which boils down to universal quantification over the focus set of alternatives), whereas the preverbal focus in Hungarian is invariably [+exhaustive].<sup>3</sup> The contextual mismatch described in Section 2.2. (ex. (2) and (3)) is, on this interpretation, basically reducible to the difference in context compatibilities due to a difference in feature specification.

The objective of this approach is obviously to salvage both the universality of focus and the context-to-meaning approach: context is still the unique determinant of

---

<sup>3</sup> The exhaustivity interpretation of Hungarian focus is not uncontroversial – see e.g. Wedgwood (2005) for convincing counterarguments.

meaning, while the variation in use is due to parametrisable semantic variation. The idea that different focus constructions can have different feature specifications seems to me to be beyond doubt, since it is well attested both within and across languages (cf., for instance, the difference between the prosodic focus and the cleft construction in English). It is the context-to-meaning part that is in need of some clarification. In example (2) it is shown that in Hungarian, the acceptable answer to a constituent question must contain a preverbal focus. If the context uniquely determines the acceptability of a focus construction, this implies that all answers to questions in Hungarian have to be exhaustive, i.e. that focus alternatives have to be in the scope of a universal quantifier. This is not a plausible interpretation, given the everyday pragmatics of answers, so that we have to assume that there is more to Hungarian preverbal focus than a simple feature specification. I would like to suggest that it is the second possible remedy for the universality of focus, rhetorical variation, i.e. variation in the rhetorical specifications for different contexts in natural discourse.

### *3.3. Partial remedy 2: Rhetorical variation*

If we drop the context-to-meaning approach, i.e. if we recognise that there is no natural one-to-one relationship between contexts and focus constructions which has to be valid across languages, we can argue for the existence of yet another possible solution to the problem of the universality of focus: rhetorical variation. In this line of explanation, focus can still be considered a universal category with unitary core meaning; observed variation, if it cannot be accounted for by resorting to parametric feature variation, is reduced to different rhetorical conventions in discourse. Rhetorical conventions, which can vary from language to language, can be represented as sets of contexts in which the focus meaning is expressed in L(anguage)<sub>1</sub> and left underspecified in L<sub>2</sub>. The underlying logic of this approach similar to that of the previous remedy: Two focus constructions in two languages,  $\alpha_1$  and  $\alpha_2$ , are identified as such by means of focality tests and are assumed to be basically identical in meaning. The fact that  $\alpha_1$  and  $\alpha_2$  appear in contexts which only partially overlap is explained as a consequence of different rhetorical specifications for specific contexts in the given languages.

One convenient example for this type of variation would be question-answer pairs in Hungarian and English, if we assume that this specific context class is specified for one type of focus in one language and for another in another language; in this way the initial equation “Hungarian preverbal focus = English cleft” can be upheld, and the

burden of accounting for the observed variation is on the discourse rhetoric of these two languages. Another instance of rhetorical variation is the fronted focus constructions in the languages of the Balkans. Modern Greek and Serbo-Croat both have a focus construction in which the focus is placed clause-initially (F(ron)ted)F(ocus)-construction). As I demonstrated elsewhere (Matić 2003), the semantics of this construction is basically identical in both languages: FF construction has a scalar additive focus semantics, quantifying over alternatives in a way resembling (though not identical to) the English particle *even*. Despite this semantic identity, Modern Greek and Serbo-Croat FF constructions are not used in identical contexts. Consider the following example:

- (6) (a) Modern Greek (article title, *Elefterotipia*, 13.09.2000, p. 20)  
 ✓[Tin arsi ton kirose-on kata tis Afstria-s]<sub>FOC</sub>  
 art.acc raising art.gen.pl sanction-gen.pl against art.gen A.-gen  
 apofasi-s-e i EE.  
 decide-aor-3 art EU
- (b) Serbo-Croat  
 # [O ukidanj-u sankcija protiv Austrij-e]<sub>FOC</sub> odluči-la je EU.  
 on raising-acc sanction.gen.pl against A.-gen decide-ptc aux EU  
 ‘The European Union decided to lift the sanctions against Austria.’

In Modern Greek, FF construction is often used in out of the blue contexts, as in (7a); in Serbo-Croat, as shown in (7b), this construction is unequivocally infelicitous in uttered out of the blue. Since the semantics of FF construction is identical in both languages, we have to conclude that the difference lies in the context specification: Modern Greek has conventionalised the use of a specific type of focus construction in one context type, whereas Serbo-Croat strongly disfavours the use of this construction in this same context. This basically boils down to the claim that the expression of a certain meaning in a certain context is in part a function of language-specific discourse conventionalisations.

This approach to the variation of focus constructions does not exclude the idea of parametric feature variation, but rather complements it by acknowledging the possibility of a one-to-many relationship between context and meaning.

### 3.4. Possible conclusion II: Focus is universal, after all?

Taken together, parametric feature variation and rhetorical variation can probably account for a considerable number of the variation phenomena mentioned in this paper and thus make the existence of a semantically based grammatical primitive ‘focus’ more probable than it seemed at the outset. Differences in context compatibilities and in focus types receive their natural explanation in the parametric nature of focus and in the parametric nature of discourse. We may thus conclude that focus indeed is universal, but with a proviso: semantic and rhetorical feature variations must be taken into account in the typological work on focus.

## 4. Limits of parametric variation

The optimistic conclusion reached at in the preceding section – optimistic for the universalist stance, that is – basically assumes that all constructions signalling presence of alternatives encode focus and relegates all differences to the realm of parametric variation. The question that naturally arises in this kind of account is how far the variation can go for a construction to still count as focus-denoting, i.e. how many idiosyncrasies a construction can have and still be a focus construction. This is a crucial question, since postulating a universal category can only be scientifically justified if the precise limits of the category can be determined.

To illustrate the difficulties of delimitation, let us take a look at a relatively well known focus construction, the nominal focus marked with *baa/ayaa* in Somali, a Cushitic language spoken in eastern Africa (see Saeed 1984 for a detailed description of the system). On the basis of the question-answer test it is easy to conclude that *baa/ayaa* is indeed attached to constituents denoting focus, so that it can be safely assumed to be a focus construction:

- (7) **Yaa** Maryam dilay?                    – **Cali baa** Maryam dilay.  
who Maryam beat.pst.3m.foc Cali foc Maryam beat.pst.3m.foc  
‘Who beat Maryam?’ – ‘CALI beat Maryam.’ (Tosco 2002: 31)

However, there are some indications that the denotational field of *baa/ayaa* is much broader than that of a typical focus construction. First, it is regularly used with

dummy arguments (Lecarme 1999: 284), which cannot invoke alternatives and can therefore not be focused:

- (8) **Wax baan** akhrínayaa  
thing foc:1sg read  
'I am reading.' (lit. # 'I am reading SOMETHING' as an answer to the question 'What are you doing')

Second, and more important, a look at Somali natural discourse reveals that in most instances, *baa/ayaa* is not used to demarcate expressions which are to be interpreted with respect to alternatives, i.e. classical foci, but rather to mark constituents denoting topic or scene switch in narrative discourse (Tosco 2002); for instance, expressions corresponding to the discourse connector 'and then' are regularly marked with *baa/ayaa*. Example (10) illustrates this:

- (9) **Maalin baa** nin socota ahi, shabeel waddada dhex bilqan  
day foc man traveller was leopard road=def middle spread  
ku kulmay.  
in met  
# 'ONE DAY a traveller met a leopard lying on the road'.  
# 'It was ONE DAY that a traveller met a leopard...' (Tosco 2002: 37)

It is important to note that the semantics of *baa/ayaa* can be construed as having to do with alternatives, even for examples like (8) and (9), if one is willing to do so. Thus, it is possible to claim that in (9), *maalin baa* 'one day' is interpreted against the background of the previous days in a story, or in contrast to all the possible days or nights in which one could bump into a leopard, or similar; and the focused dummy in (8) can be assumed to be interpreted in contrast to a negative existential, i.e. that 'reading (something)' stands in opposition to 'reading nothing', etc. The contexts of usage which are doubtless radically different from those in which e.g. European languages employ focus constructions can be attributed to different rhetorical constraints in Somali discourse, or perhaps also to one or another type of difference in feature specification.

But if we decide to do so, i.e. to force an obviously recalcitrant construction into our general definition of focus, we should still be aware that the category denoted by *baa/ayaa* is in actual fact quite different from the category denoted by prosody or

clefting in English and other European languages, on the basis of which the notion of focus is defined in the first place. We are faced with a dilemma here: on the one hand, there is a possibility to use the remedies proposed in Section 3 in order to salvage the universality of the posited grammatical primitive ‘focus’, but on the other, these remedies seem to be so generous to the analysing linguist that they may lead to a wrong characterisation of the construction in question. In other words, we can reach the desired level of generality with our tools, but at the price of possibly misinterpreting data and rendering the tools we use vacuous, since they can turn anything to focus, if need be.

Thus, the dilemma we are confronted with is actually the classical linguistic problem of having to decide whether one wishes to lump categories together or to split them apart. Lumping categories together implies a conscious decision to neglect the differences, since they only blur the great picture. The advantage of this approach is that one can easily assume the existence of a unified category and make large-scale generalisations on the encoding of focus and on the syntax-semantics interface in general. Splitting categories basically means that one takes differences seriously. This inevitably leads to the assumption that there are a number of cognate, but not identical categories and results in the kind of research which investigates differences themselves, since they allow us an insight into the possible range of variation across languages. Lumping and splitting are thus not only distinct with respect to their attitude towards the linguistic methodology, but they basically correspond to two distinct research programmes.

At least with respect to the typology of focus constructions, both approaches face some serious problems. In ignoring semantic/pragmatic differences, lumpers may find themselves in a position to compare apples and oranges, i.e. to draw conclusions on the basis of a completely heterogeneous material; the problem lumpers have is thus obviously an ontological one. Splitters, on the other hand, have to cope with a methodological difficulty: given the current definition of focus and the parameters of variation, there are no explicit criteria for drawing a line between the variation within one category and two distinct categories.

One solution for the lumpers’ problem that I can think of would be to assume that cross-linguistic categories, including focus, are organised as prototypical categories. Since in this understanding of categories, having only some properties of a category presents no serious obstacle for the membership in it, the apples-and-oranges problem would not arise. This solution has a quirk, though: the psychological reality of cross-linguistic prototypes is highly doubtful (cf. e.g. Dryer 1997), so that it is not clear what independent justification we have for positing their existence, apart from avoiding

problematic consequences of our disregard for variation. It hence seems to me that we still do not have a good solution for the ontological problem of lumping approaches.

The solution of the problem splitters face seems easier to reach. The splitters' difficulty is basically the fact that the definition of focus usually employed is too broad, since it is based on only one attribute, that of invoking alternatives. Greater precision and clearer criteria for discerning a member of the category 'focus' from a member of similar, but distinct categories, can be achieved by enriching the definition with further attributes. For instance, one possible candidate would be the condition that the alternatives invoked have to belong to the assertive part of the utterance (cf. Lambrecht 1994); other enrichments are also conceivable (and desirable).

In other words, my impression is that the splitting approach has a better chance to overcome the obstacle of insufficient precision in dealing with focus constructions cross-linguistically. This means that constructions like the Somali *baa/ayaa* structure cannot be counted as focus constructions anymore, since they clearly transgress the limit posited by the enriched definition of focus. The typological corollary of this is that we once more have to get back to the preliminary conclusion I (Section 2.4), which denies the universality of focus, albeit this time with a more cautious wording.

## **5. En lieu of a conclusion: Focus needn't be universal**

It has been shown that the a priori assumption of the existence of a unitary focus meaning across languages cannot be upheld without serious damage to descriptive adequacy and methodological accuracy. On the other hand, it is also clear that not every difference between two constructions must lead to the conclusion that there is no cross-linguistic comparability at all, since we have means to account for the variation within certain limits. Given our present state of knowledge and the present state of our methodology, it seems reasonable to refrain from apodictic judgements of the type 'there is/there isn't a universal grammatical feature "focus"' and formulate our conclusions with more caution. I would like to suggest that focus as a grammatical category need not necessarily be encoded in every language, though it might perhaps in the end turn out that it is encoded in many, maybe in the majority of languages. This is basically an empirical question, and in dealing with single languages, it seems reasonable to have in mind both the ways of explaining the observed semantic variation (my remedies 1 and 2), and the limits of these remedies (as demonstrated in Section 4).

From the European perspective, focusing seems to be all-pervasive, so that one might wonder whether it is really conceivable that it may turn out that there is a language which does not encode focus at all (and this a possible, even probable outcome of the research programme outlined above). A nice quote can give us a clue on how this may work:

Many of the ideas associated with focus [...] are closely related to context and speaker's intentions (salience, noteworthiness, inferred alternatives), which implies that they needn't always be directly encoded in linguistic structure. (Wedgwood 2008)

In addition to the rather technical methodological caveats to which this paper is dedicated, this quote adds a more general caveat: Not everything that is relevant for interpretation must be encoded as a separate grammatical category, and this holds true for focus as for any other semantic value.

## Abstract

The Korean focus particle *-lato* carries the implication similar to that of English *even*, but also shows distributions which are unlike *even*, or *even*-like items in other languages (German *auch nur*, Italian *anche solo*, etc). In this paper I claim that the Korean focus particle *-lato* can be analyzed in parallel with *auch nur* or *anche solo*, by decomposing it into the covert exclusive particle similar to English *merely* and the additive particle *-to*, which is similar to *also*. Furthermore, to account for the difference between *-lato* and *auch nur* or *anche solo*, I assume that *-to* in *-lato* introduces an additive presupposition weaker than that of *also*, *auch* or *anche*.

**Keywords:** *-lato*, *even*, weak additivity, exclusivity, factivity, scalarity.

## 1. Introduction

The Korean focus particle *-lato* has been widely discussed by various authors (Lee et al. 2000, Choi 2007, among others) due to its unique distribution and implication. The following examples exhibit the characteristic properties of *-lato*. First, *-lato* associates with focus (Rooth 1985), and carries a scalar implication apparently identical to that of English *even*:

- (1) a. *Mary-ka John-ekey [sakwa]<sub>f</sub>-lato cwuessta-nun kes-un sasil-i anita.*

---

<sup>1</sup> This paper is a direct extension of Lim (to appear): the core analysis and the organization are basically identical, but some revisions and extensive discussions are added. I would like to thank audiences at 17<sup>th</sup> Japanese/Korean Linguistics Conference and CIL 18, as well as Jinyoung Choi, Barry Schein, and Roumyana Pancheva, for their comments and suggestions. Special thanks go to Elena Guerzoni for the detailed comments and extensive discussions. All remaining errors are mine.

Mary-Nom John-Dat apple-*lato* gave-Rel Comp-Top fact-Nom Neg  
 “It is not the case that Mary even gave [apples]<sub>f</sub> to John.”

- b. *Mary-ka [John]<sub>f</sub>-ekey-lato sakwa-lul cwuessta-nun kes-un sasil-i anita.*  
 Mary-Nom John-Dat-*lato* apple-Acc gave-Rel Comp-Top fact-Nom Neg  
 “It is not the case that Mary even gave apples to [John]<sub>f</sub>.”

(1a), where *-lato* associates with *sakwa* ‘apple’, carries the implication that apples are the most likely objects for Mary to give to John, just like its English counterpart, where *even* associates with *apples*. Similarly, the implication of (1b) is that John is the most likely person to receive apples from Mary, the same implication as what its English counterpart carries.

Second, the distribution of *-lato* is similar to that of Negative Polarity Items (hereafter NPIs) like *any* or *lift a finger*. (2) shows *-lato* is not acceptable in plain affirmative sentences, and (3) shows it is acceptable in the scope of long-distance negation.

- (2) a. ??*John-un [sakwa]<sub>f</sub>-lato mekessta.*  
 John-Top apple-*lato* ate  
 b. #John ate any apple.
- (3) a. *Mary-ka [sakwa]<sub>f</sub>-lato mekessta-nun kes-un sasil-i anita.*  
 Mary-Nom apple-*lato* ate-Rel Comp-Top fact-Nom Neg  
 “It is not the case that Mary even ate apples.”  
 b. It is not the case that Mary ate any apples.

Things become complicated, however, when we notice that *-lato* is different from run-of-the-mill NPIs in two crucial respects. First, as (4) shows, *-lato* is not acceptable in the immediate scope of negation, which is different from *any*:

- (4) a. #*John-un [sakwa]<sub>f</sub>-lato mek-cianh-ass-ta.*  
 John-Top apple-*lato* eat-Neg-Past-Decl  
 b. John did not eat any apple.

Secondly, *-lato* is licensed in a significant number of contexts where NPIs are known to be unacceptable, including under modals, as shown in (5):

- (5) *John-un [Bill]<sub>f</sub>-i-lato manna-yaha-n-ta.*

John-Top Bill-L-*lato* meet-necessary-Pres-Decl  
 “John must meet even/at least Bill.”

In this paper I claim that, a la Guerzoni’s (2003, 2006) analysis of German *auch nur* ‘(lit.) also only’ and Italian *anche solo* ‘(lit.) also only’, and Nakanishi’s (2006) analysis of Japanese *-dake-demo* ‘(lit.) only even’, *-lato* can be decomposed into two independent scope-taking components. Specifically, I propose that, *-lato* consists of the covert exclusive particle corresponding to English *just* or *merely*, which carries the exclusive and most-likely presuppositions, and another particle which carries a weaker additive presupposition than *auch*, *anche*, and *-demo*, requiring the existence of the *non-false* alternatives to the assertion instead of true ones. Before presenting the analysis, however, let us first see some of previous analyses, and why they failed to correctly account for the peculiar behavior of *-lato*.

## 2. First trial: *-lato* vs. *even<sub>npi</sub>*

### 2.1. Rooth’s (1985) *even<sub>npi</sub>*

Rooth(1985) analyzes *even* as taking a propositional scope and quantifying over a set of contextually salient alternatives to the proposition in its scope. In this analysis, the set of alternatives (*focus value* in Rooth 1985, and marked by the notation  $[[ \ ]]^f$ ) is obtained compositionally by replacing the denotation of focused constituents with the objects of the same semantic type. An example is given in (6).

- (6) a. *I met even [Mary]<sub>f</sub>.*  
 b. LF: *even [I met Mary]*  
 c.  $[[[(6b)]]]^f = \{I \text{ met Mary, I met Bill, I met John, .....}\}$

Once combined with this set and the proposition in its scope (the *prejacent*), *even* introduces the presupposition that the prejacent is the least likely presupposition among the alternatives in the contextually salient set C (Horn 1969, Rooth 1985). An example is given in (7), and the lexical entry for *even* can be described as (8).

- (7) a. *I met even [Mary]<sub>f</sub>.*  
 b. Assertion: *I met Mary*

c. Scalar presupposition: Mary is the least-likely person for me to meet.

(8)  $[[\textit{even}]]^w(C)(p)$  presupposes that  $p$  is the **least likely** proposition in  $C$

However, the presupposition of *even* seems to be changed under the negation, as shown in (9), where the scalar presupposition is most-likely rather than least-likely. This is problematic in the standard theory of presupposition projection, for it is generally accepted that under negation presuppositions do not change.

(9) a. *I did not meet even [Mary]<sub>f</sub>.*

b. Assertion: *I did not meet Mary*

c. Scalar presupposition: Mary is the most-likely person for me to meet.

Rooth (1985) tries to solve this problem by assuming that *even* in (9c) is a different homophone (*even<sub>npi</sub>*) which is only licensed under the context where NPIs are licensed, and directly introduces a most-likely presupposition:

(10)  $[[\textit{even}_{npi}]]^w(C)(p)$  presupposes that  $p$  is the **most likely** proposition in  $C$

(11) a. *I did not meet even [Mary]<sub>f</sub>.*

b. LF: [Neg [*even<sub>npi</sub>* [I met Mary]]]

c. Scalar presupposition: Mary is the most likely person for me to meet.

## 2.2. *-lato as even<sub>npi</sub>* - why and why not

We have already seen some examples suggesting that *-lato* seemingly corresponds to Rooth(1985)'s *even<sub>npi</sub>*: it is not acceptable in episodic affirmative sentences (see 2), but acceptable in the scope of negation (see 3). (12) shows two further pieces of seemingly supporting evidence. First, *-lato* is acceptable under some entailment-reversal environments (including downward-entailment and Strawson-entailment in the sense of von Stechow 1999), like under the scope of *nollap*- 'be surprised'. Second, *-lato* combines with semantically weak foci, which is compatible with the most-likely presupposition, line the one triggered by *even<sub>npi</sub>*.

(12) *Na-nun John-i kwuk [han]<sub>f</sub> / #[payk]<sub>f</sub> swukalak-i-lato*  
 I-Top John-Nom soup one / 100 spoon-L-lato  
*mekessta-nun sasil-i nollapta.*

Ate-Rel                      fact-Nom                      be surprised.

“I am surprised that John even ate one spoon of soup.”

This view faces several problems, however. First, as shown in (4), *-lato* is not acceptable under local negation. Second, *-lato* is allowed under some contexts where NPIs are not acceptable, including modals (see 5) and attitude predicates (13).

- (13) *Na-nun John-i kwuk [han]<sub>f</sub>/#[payk]<sub>f</sub> swukalak-i-lato*  
 I-Top John-Nom soup one / 100 spoon-L-lato  
*mekessta-ko mitnunta.*  
 Ate-Comp believe

“I believe that John even ate one spoon of soup.”

Finally, in yes/no questions *-lato* triggers an obligatory negatively biased interpretation, which cannot be accounted for in terms of *even<sub>npi</sub>* analysis (see Guerzoni 2003, 2004). The bias effect is illustrated in (14):

- (14) *John-i [il]<sub>f</sub> talle-lato peless-ni?*  
 John-Nom one dollar-lato earned-Q  
 “Did John make (even) a single dollar?”  
 Bias: John did not make any money.

### 3. Second trial: *-lato* vs. *auch nur* and *anche solo*

*-lato* actually shares some semantic and distributional properties with German *auch nur*, Italian *anche solo*, or Japanese *-dake-demo*. Following examples show similarities between *-lato* and *auch nur*, *anche solo*, or *-dake-demo*, and the differences between them and English *even*. First, unlike English *even*, *-lato*, as well as *auch nur*, *anche solo*, and *-dake-demo*, is not acceptable in the local scope of negation, as already mentioned in the introduction.

- (15) a. *#John-un [sakwa]<sub>f</sub>-lato mek-cianh-ass-ta.*  
 John-Top apple-lato eat-neg-Past-Decl  
 b. *#Hans kann nicht auch nur [Italienisch]<sub>f</sub>* (German)  
 Hans knows not also only Italian (Schwarz 2005)  
 c. *#John-wa [sono hon]<sub>f</sub>-dake-demo yom-ana-katta.* (Japanese)

John-Top that book-only-even read-Neg-Past (Nakanishi 2006)

Furthermore, *-lato* does not associate with semantically strong foci, unlike English *even*, but similarly to *auch nur*, *anche solo*, and *-dake-demo*.

(16) a. *John-un Mary-ka sakwa [han]<sub>f</sub> /#[paek]<sub>f</sub> kay-lato*

John-Top Mary-Nom apple one /100 CL-*lato*

*mek-ess-ta-nun sasil-ey nola-ess-ta.*

eat-Past-Decl-Rel fact-Dat be surprised-Past-Decl

“John was surprised that Mary ate even one apple / 100 apples”

b. *Es hast mich überrascht dass die Maria auch nur die [einfachste]<sub>f</sub>/*

It has me surprised that the Maria also only the easiest /

*#[schwierigste]<sub>f</sub>frage beantworten konnte.*

hardest question answer could (German: Guerzoni 2006)

Facts considered above lead us to consider about Guerzoni(2003, 2006)’s proposal about *auch nur* and *anche solo*, and Nakanishi(2006)’s proposal about *-dake-demo*.

### 3.1. Guerzoni’s (2003, 2006) analysis on *auch nur* and *anche solo*

Guerzoni (2003, 2006) proposes that the *even*-like semantics and restricted (NPI-like) distribution of items like *auch nur* or *anche solo* is the consequence of the composition and scope of their evident subcomponents. In her proposal, *auch nur*, *anche solo*, and their cross-linguistic cognates can be analyzed compositionally as a combination of two particles: the additive particle (17) (like *also*) and the scalar exclusive particle in (18) (corresponding to *only*), consisting of three different components – factivity, scalarity, and exclusivity (Guerzoni 2003: 175).

(17)  $[[auch/anche/also]]^w(C)(P)$  is defined iff some proposition in  $C \neq p$  is true in  $w$ .

(18)  $[[nur/solo/only]]^w(C)(P)$  is defined iff

(i)  $p(w) = 1$  factivity

(ii)  $p$  is the most likely/insignificant proposition in  $C$  scalarity

If defined, then (iii)  $\sim \exists q \neq p$  in  $C$  that is true (unless  $p$  entails  $q$ ) exclusivity

Guerzoni (2003, 2006) also assumes that in German and Italian, *nur/solo* is

underspecified relative to whether the prejacent is presupposed and exclusivity asserted or the other way around. Guerzoni labels this second option *nur<sub>2</sub>/solo<sub>2</sub>*:

- (19)  $[[nur_2/solo_2]]^w(C)(p)$  is defined iff
- |  |             |
|--|-------------|
| (ii) p is the most likely/insignificant proposition in C             | scalarity   |
| (iii) there is no other q in C that is true (unless p entails q)     | exclusivity |
| If defined, then (i) $[[nur_2/solo_2]]^w(C)(p)$ is true iff $p(w)=1$ | factivity   |

Guerzoni argues that the unacceptability of *auch nur* or *anche solo* in plain affirmative sentences and a number of other linguistic contexts is due to the contradiction between their presuppositions emerging when the particles associate with the same focus and take the same scope (see 20), whereas the clash is resolved when *auch* or *anche* scopes outside entailment reversal expressions at LF (see 21).

- (20) #*Hans hat auch nur [[die Maria]<sub>f</sub> getroffen*.

LF: [auch [nur<sub>2</sub> [Hans hat [[die Maria]<sub>f</sub> getroffen]]]

Presupposition due to *nur<sub>2</sub>*: Hans met no x different from Mary & Mary was the most likely for him to meet.

Presupposition due to *auch*: Hans met someone different from Mary.

- (21) *Niemand auch nur [[die Maria]<sub>f</sub> getroffen*.

LF: (iii) auch [niemand<sub>1</sub> (ii) 1 [nur [t<sub>1</sub> [[die Maria]<sub>f</sub> getroffen]]]

Presupposition of *auch*: There is some  $x \neq M$ . that nobody met x.

Presupposition of *nur<sub>2</sub>* at (ii): There is no  $x \neq M$ . that everybody met x & Mary was the most likely for everyone to meet.

### 3.2. -lato as also + only: preliminary evidence

One part of my proposal about -lato is that, in parallel with Guerzoni's analysis of *auch nur* / *anche solo*, -lato can be decomposed into a covert exclusive particle, corresponding to Guerzoni's *nur<sub>2</sub>/solo<sub>2</sub>*, and an additive particle -to. In the following subsection I will provide some preliminary evidence supporting my proposal.

#### 3.2.1. Morphological complexity of -lato

Overtly, -lato contains the particle -to, comparable to English *even/also*, and the affix -la, which also features in Korean as combined with the conditional marker -myen in -lamyen and the contrastive marker -ya in -laya:

(22) *-la* + {*myen*, *to*, *ya*}

- a. *John-i-la-myen ku il-ul ha-lswuiss-ta.*  
 John-L-*la*-COND that work-Acc do-be able to-Decl  
 “If he is John, he can do that work.”
- b. *John-i-la-to ku il-ul ha-lswu-iss-ta.*  
 John-L-*la*-also that work-Acc do-be able to-Decl  
 “Even if he is John, he can do that work.”
- c. *John-i-la-ya ku il-ul ha-lswuiss-ta.*  
 John-L-*la*-Cont that work-Acc do-be able to-Decl  
 “(roughly) Only John can do that work.”

Each particle, *-myen*, *-to*, and *-ya* can be used in isolation in Korean. In addition, *-man* can appear before *-lato*, forming *-manilato*, but cannot co-occur with *-to*, forming *-manto* as shown in (23):

- (23) a. *wain [han]<sub>f</sub> can-(man)-i-lato masi-myen ku-nun haykotoy-lkes-ita.*  
 wine one CL-only-L-*lato* drink-Cond he-Top get fired-Fut-Decl  
 “Even if he drinks one glass of wine he will get fired.”
- b. \**wain [han]<sub>f</sub> can-man-to masi-myen ku-nun haykotoy-lkes-ita.*  
 wine one CL-only-*to* drink-Cond he-Top get fired-Fut-Decl  
 (Intended reading: same as 23a)

It is plausible to account for the facts given in (22) and (23) by assuming that *-la* in *-lato* signals the presence of a covert exclusive *-man<sub>2</sub>*, corresponding to English *merely* and Guerzoni’s *nur<sub>2</sub>/solo<sub>2</sub>*, but semantically different from the overt *-man* (corresponding to Guerzoni’s *nur<sub>1</sub>/solo<sub>1</sub>*).<sup>2</sup>

### 3.2.2. Semantic equivalence between *-lato* and *-man...-to*

In Korean concessive conditionals with *-lato* are fully equivalent to concessive conditionals with *-man...to*. In (24a) the conditional marker *-myen* is on the antecedent, and *-lato* is on the focus of the antecedent, whereas in (24b) *-man* is on the focus of the antecedent and *-to* is on the antecedent. However, they seem semantically equivalent: both (24a) and (24b) means (24c).

<sup>2</sup> Chungmin Lee and Jiyoung Shim (p.c.) pointed out the difference between *-lato* and *-man-i-lato*, and Elena Guerzoni and Maria-Luisa Zubizarreta (p.c.) suggested to me to make it clear the difference between the covert exclusive particle and the overt *-man*.

- (24) a. *wain [han]<sub>f</sub> can-i-lato masi-myen ku-nun haykotoy-lkes-ita.*  
 wine one CL-L-*lato* drink-Cond he-Top get fired-Fut-Decl  
 b. *wain [han]<sub>f</sub> can-man masi-e-to ku-nun haykotoy-lkes-ita.*  
 wine one CL-L-only drink-L-also he-Top get fired-Fut-Decl  
 c. *Even if he drinks [one]<sub>f</sub> glass of wine he will get fired.*

This equivalence lends further plausibility to the idea that *-lato* consists of the covert exclusive particle and the overt additive particle.

### 3.3. Why *-lato* is not *auch nur* or *anche solo* - difference in distribution

Even though there are striking similarities between *-lato*, on the one hand, and *auch nur* and *anche solo*, on the other hand, there are significant differences between them, which prevents us from applying Guerzoni's proposal to *-lato* without any revision. Most of all, as pointed out in the introduction, *-lato* is licensed under attitude predicates (see 13 above) and non-counterfactual modals (see 5 above), whereas its German and Italian cognates are not acceptable under these contexts. See (25).

- (25) a. *Ich glaube #(nicht) dass du auch nur die Maria begrüsst hast.*  
 I believe not that you also only the Mary greet have  
 b. *#Es ist möglich dass der Hans auch nur die Maria begrüsst.*  
 It is possible that the Hans also only the Mary greets.

## 4. Solving the puzzle

To account for the apparently contradicting facts, I would like to propose that the difference between *-lato* and *auch nur/anche solo* is due to the fact that *-to* in *-lato* carries presuppositions different from the ones that *also/auch/anche* carry. The lexical entries for the covert exclusive particle *-man<sub>2</sub>* and the additive particle *-to* are shown in (26) and (27), respectively.

- (26)  $[[\text{-man}_2]]^w(C)(p) = [[\text{nur}_2/\text{solo}_2]]^w(C)(p)$  is defined iff
- |  |             |
|--|-------------|
| (i) p is the most likely/insignificant proposition in C                        | scalarity   |
| (ii) there is no other q in C that is true (unless p entails q)                | exclusivity |
| If defined, then $[[\text{nur}_2/\text{solo}_2]]^w(C)(p)$ is true iff $p(w)=1$ | factivity   |

(27)  $[[\text{-to}]]^w(C)(p)$  is defined iff

(i)  $\exists q [q \in C \wedge q \neq p] \wedge q(w) \neq 0$  (weak) additivity

(ii)  $p$  is the LEAST likely proposition in  $C$  scalarity

If defined, then  $[[\text{-to}]]^w(C)(p) = p(w)$

In this proposal,  $\text{-man}_2$  shares the same lexical entry as Guerzoni's  $\text{nur}_2/\text{solo}_2$ , but  $\text{-to}$  is different from  $\text{auch/anche/also}$  in two respects. First, as in (27ii),  $\text{-to}$  introduces the same scalar presupposition as Karttunen and Peters' (1979) *even*, unlike what has been assumed about other additive particles like *also*. Second, the additive presupposition of  $\text{-to}$  is weaker than the additive presupposition of  $\text{auch/anche/also}$ , in that it only requires that there be an alternative proposition different from the prejacent which is *not false* (i.e. either *true* or *undefined*), while *auch* requires the existence of a true alternative. In the following subsections I will show how this lexical difference explains the distribution and meaning of  $\text{-lato}$ .

#### 4.1. Simple affirmative sentences

Let us begin with the simple affirmative sentence (28).

(28) ??John-un [Bill]<sub>f</sub>-i-lato manna-ess-ta.

John-Top Bill-L-*lato* meet-Past-Decl

(Intended reading: 'John even met [Bill]<sub>f</sub>')

My account predicts that (28) is unacceptable because of the contradiction between the presupposition of the covert exclusive particle  $\text{-man}_2$  and that of the overt additive particle  $\text{-to}$ , like Guerzoni's account for *auch nur/anche solo*. However, I claim that, unlike *auch nur/anche solo*, presuppositions in contradiction in  $\text{-lato}$  are the scalar ones rather than the existential ones. (29) shows this point.

(29) Scalarity

LF: [(iii) *to* [(ii)  $\text{man}_2$  [(i) John [[Bill]<sub>f</sub> manna-]]]

(i):  $[[\text{(i)}]]^o(w) = 1$  iff John met Bill in  $w$

$[[\text{(i)}]]^f(w) = \{\lambda w. J. \text{ met } x \text{ in } w: x \in D_e\}$

(ii):  $[[\text{(ii)}]]^o(w)$  is defined if B. is the MOST likely for J. to meet in  $w$

(iii):  $[[\text{(iii)}]]^o(w)$  is defined iff

B. is the MOST likely person in  $w$  for J. to meet. (from  $\text{man}_2$ )

AND B. is the LEAST likely person in w for J. to meet. (from  $-to$ ) ( $\perp$ )

In (29), since the two focus particles take essentially the same scope, in (iii), we derive the scalar presupposition that Bill is the most likely person for John to meet, due to the presence of  $-man_2$ ; and at the same time, we also derive the scalar presupposition that Bill is the least likely person for John to meet, because of the presence of  $-to$ . Therefore we get the presupposition clash.

On the other hand, (30) shows, unlike in *auch nur* or *anche solo*, there is no clash between the exclusive presupposition of  $-man_2$  and the additive presupposition of  $-to$  due to the weakness of the latter.

(30) (Weak) additivity and exclusivity

LF: [(iii) *to* [(ii)  $man_2$  [(i) *John* [[*Bill*]<sub>f</sub> *man-na*]]]

(i):  $[[\text{(i)}]]^o(w) = 1$  iff John met Bill in w

$[[\text{(i)}]]^f(w) = \{\lambda w. J. \text{ met } x \text{ in } w: x \in D_e\}$

(ii):  $[[\text{(ii)}]]^o(w)$  is defined iff  $\sim \exists x \neq B. \text{ s.t. } J. \text{ met } x$

$[[\text{(ii)}]]^f(w) = \{\lambda w. \sim \exists y \neq x \text{ s.t. } J. \text{ met } y \text{ in } w. \text{ John met } x \text{ in } w: x \in D_e\}$

(iii):  $[[\text{(iii)}]]^o(w)$  is defined iff

John met no one different from Bill (from  $man_2$ )

AND for some  $x \neq \text{Bill}$ ,  $[\lambda w'. \text{ John met no one } \neq x.$

$\text{John met } x](w) = 1$  or undefined (from  $-to$ )

The focus value of (i) in (30) is a set of alternatives determined by the focus on *Bill*. Turning to (ii), the interpretation of this constituent comes with the definedness condition introduced by  $man_2$ , that is that John met Bill and no one else. Given this, the focus value of this same constituent is going to be a set of alternatives, each coming with a similar definedness condition. Specifically, each alternative is defined iff John met no individual different from the one substituted for Bill in that alternative. Given this, and given that the assertion entails that John met Bill, all alternatives different from the prejacent will turn out to be undefined, a situation that trivially satisfies the weak additive presupposition of  $-to$ , hence no clash. Therefore, we can safely conclude that, within this analysis, scalarity is the only factor ruling out (28).

This conclusion leads us to a very interesting and novel prediction: if we can construct examples where the relative scope of the two particles makes the scalar presuppositions of  $-to$  and  $-man_2$  compatible, we expect that example to be grammatical. The prediction is correct, as this is exactly what happens when moving  $-to$

outside the scope of modals, attitude predicates, and long-distance negation. As an illustration, in the following subsection I will show how the presupposition clash between two scalar presuppositions can be resolved via movement in modalized sentences.

### 3.2. Modals

Consider the following example.

- (31) *John-i [Bill]<sub>f</sub>-i-lato manna-totoy-n-ta.*  
 John-Nom Bill-L-*lato* meet-may-Pres-Decl  
 “John may meet merely Bill.”

The additive presupposition of *-to* and the exclusive presupposition of the hidden *-man<sub>2</sub>* are going to be compatible with each other, regardless of the position of *-to* at LF. (32) shows that two scalar presuppositions are compatible each other if *-to* moves above the modal.

#### (32) Scalarity

- LF: [(iv) *-to* [(iii)  $\diamond$  [(ii) *-man<sub>2</sub>* [(i) John [[*Bill*]<sub>f</sub> manna-]]]]]
- (i): [[(i)]]<sup>o</sup>(w) = 1 iff John meet Bill in w  
 [[(i)]]<sup>f</sup>(w) = { $\lambda w$ . John meet x in w:  $x \in D_e$ }
- (ii): [[(ii)]]<sup>o</sup>(w) is defined iff  $\sim \exists x \neq \text{Bill}$  such that John meet x  
 [[(ii)]]<sup>f</sup>(w) = { $\lambda w$ :  $\sim \exists y \neq x$  s.t. John met y in w. John meet x in w:  $x \in D_e$ }
- (iii): [[(iii)]]<sup>o</sup>(w) is defined iff B. is the most likely for J. to meet in w  
 If defined, [[(iii)]]<sup>o</sup>(w) = 1 iff J. is allowed to meet B. in w.  
 [[(iii)]]<sup>f</sup>(w) = { $\lambda w$ : B. is the most likely person for J. to meet in w.  
 $\exists w'$ , John is allowed to meet x in w':  $x \in D_e$  }
- (iv): [[(iv)]]<sup>o</sup>(w) is defined iff  
 B. is **the most likely person for J. to meet in w (due to *-man<sub>2</sub>*)**  
 AND B. is **the least likely person for J. to be allowed to meet (due to *-to*)**.

As in (32), the two scalar presuppositions are ‘Bill is the most likely person for John to meet in w’ (due to *man<sub>2</sub>*) and ‘Bill is the least likely person for John to be allowed to meet in w.’ (due to *to*) One can easily think about a scenario where these presuppositions are simultaneously true, like (33):

- (33) John is an interviewer of a local newspaper, and it is typically prohibited for interviewers to get close to the secret agents. Bill, one in John's neighborhood, is indeed a secret agent. However, since Bill happens to be John's closest neighbor, it is really hard for John to avoid Bill.

In this situation it is true that (among the neighbors) Bill is the most likely person for John to meet, given the locations of their respective homes, and yet it is also true that Bill is the least likely person (among the neighbors) for John to be allowed to meet, due to their respective professions.

The same reasoning can be applied to necessity modals and attitude predicates, since one can also think about scenarios where Bill is the most likely person for John to meet as well as the least likely person for John to be required to meet, or for some to believe that John met him, etc.

### 3.3. Quantifiers<sup>3</sup>

The discussion about modals raises another problem about quantifiers. Modals can be considered quantifiers over possible worlds, and under modals the clash between scalar presuppositions of *-man* and *-to* can be resolved, we might also expect that the presupposition clash of *-lato* should be resolved under usual quantifiers, such as *nwukwunka* 'someone' or *motun* 'every'. This prediction is not borne out, however. (i) is still unacceptable even though *-lato* appears under the scope of the quantifier *nwukwunka* 'someone':

- (34) #*Haksayng nwukwunka-ka [sakwa]<sub>f</sub>-lato mek-ess-ta.*  
 student someone-Nom apple-*lato* eat-Past-Decl

This problem may be resolved if we adopt Heim's (1988) theory of presupposition projection under the scope of quantifiers, according to which a universal presupposition is derived in the scope of quantifiers. For example, in Heim (1998), the lexical entry for *some* is (35).

- (35) [[some]] =  $\lambda P.\lambda Q: \forall xP(x), x \in \text{Dom}_Q. \exists y[P(y) \& Q(y)]$

---

<sup>3</sup> The problem in this subsection was originally pointed out by Daniel Büring (p.c.).

(36) shows why under this lexical entry the presupposition clash emerges.

(36) Scalarity

LF: [(v) -to[(iv)  $\exists$ student<sub>1</sub> [(iii)  $\lambda 1$  [(ii) -man(i) [g(1)[[Mary]<sub>f</sub>]<sub>f</sub> manna-]]]]]]

[[i)]<sup>o</sup>=  $\lambda w$ . g(1) met Mary in w

[[ii)]<sup>o</sup>=  $\lambda w$ : g(1) met Mary and no one else

& Mary was the most likely for g(1) to meet. g(1) met Mary in w

[[iii)]<sup>o</sup>=  $\lambda w$ . $\lambda x$ : x met Mary and no one else

& Mary was the most likely for x to meet. x met Mary in w

[[ $\exists$ st.]<sup>o</sup>=  $\lambda P$ . $\lambda Q$ :  $\forall xP(x)$ ,  $x \in \text{Dom}_Q$ .  $\exists y[P(y) \& Q(y)](\text{student})$

=  $\lambda Q$ :  $\forall x$ : student(x),  $x \in \text{Dom}_Q$ .  $\exists y[\text{student}(y) \& Q(y)]$

[[iv)]<sup>o</sup>=  $\lambda w$ :  $\forall x$ : student(x) [x met Mary and no one else

& Mary was the most likely for x to meet].

$\exists y$  [student(y) & x met Mary in w]

[[v)]<sup>o</sup>=  $\lambda w$ :  $\forall x$ : student(x) [x met Mary and no one else

& Mary was the most likely for x to meet]

&  $\exists z \neq \text{Mary}$  such that [ $\lambda w'$ :  $\forall u$ : student(u), u met z and no one else

& z was the most likely for u to meet.

$\exists v$  [student(v) & v met z in w']](w)  $\neq 0$

&  $\forall r$ : student(r) [Mary was the least likely person for r to meet].

$\exists y$  [student(y) & y met Mary in w]

As the underlined presuppositions show in (36), under Heim(1988)'s theory of presupposition projection, the presuppositions we finally get in (36) will be, Mary was the most likely for every student to meet in w (due to the scalar presupposition of *-man*<sub>2</sub>, which is projected under the existential quantifier), and Mary was the least likely person for every student to meet in w (due to the scalar presupposition of *-to*), which clash with each other.

### 3.4. Local negation

In this last section I would like to return to the case of *-lato* under local negation.

(37) a. #John-un [aiskhulim]<sub>f</sub>-i-lato mek-cianh-ass-ta.

John-Top ice cream-L-lato eat-neg-Past-Decl

b. John did not eat any ice cream. (English)

Why does local negation matter? While the analysis proposed so far explains most cases of unacceptability of *-lato* in terms of an unavoidable conflict between the two scalar presuppositions of *-to* and *-man* respectively, in cases like (37) the scope of *-to* above negation could in principle resolve the contradiction. Given this, facts like (37) still await an explanation. Here I adopt Nakanishi's (2006) proposal on Japanese *-dake-demo* 'only even'. The following example (from Nakanishi 2006: 290) shows that *-dake-demo*, like *-lato*, is unacceptable under local negation.

- (38) \**John-wa* [sono hon]<sub>F</sub>-*dake-demo* *yom-ana-katta*.  
 John-TOP that book-only-even read-NEG-PAST  
 (Intended reading: 'John even read [that book]<sub>f</sub>')

Nakanishi (2006), whose view on *-dake-demo* is otherwise fully parallel to Guerzoni's (2003, 2006) analysis of *auch nur* and *anche solo*, provides a convincing explanation for cases like (38), which is missing in Guerzoni's theory (and in fact is not applicable in the analysis of German and Italian). Nakanishi notes that Japanese negation always takes scope under *-dake* 'only', as shown in (39).

- (39) (from Nakanishi 2006: 291, ex. 8)  
 a. *John-wa* [*Hon A*]<sub>F</sub> {-*mo*/*-demo*} *yonda-wake-de-wa-nai*.  
 John-TOP Book A {even/*-even*} read-it is not the case  
 "It is not the case that John even read Book A."  
 b. LF: [not [ even C [ John read [Book A]<sub>F</sub> ] ] ]      $\neg > \text{even}$

Given this, Nakanishi (2006) argues that both *-dake* and *-demo* in *-dake-demo* take wide scope over local negation, and the clash between two scalar presuppositions remains unresolved when they both combine with the negative proposition. (40) shows Korean *-man* also always takes wide scope over negation:

- (40) *John-un* [*Barriers*]<sub>f</sub>-*man* *an ilk-ess-ta*.<sup>4</sup>

---

<sup>4</sup> To avoid confusion here I use so-called short-form negation in Korean. In the case of long-form negation, the scope between *-man* and negation varies depending on the intonational cue.

- John-un* *Barriers-man* *ilk-cianh-ass-ta*.  
 John-Top *Barriers-only* read-neg-Past-Decl  
 a. *John-un* [*Barriers*]<sub>f</sub>-*man* *ilk-cianh-ass-ta*.

John-Top *Barriers*-only neg read-Past-Decl

“John read everything except *Barriers*” Only > Neg, \*Neg > Only

Based on this, I propose that local negation always takes narrow scope with respect to *-lato*, which makes it impossible to resolve the presupposition clash by moving *-to* in *-lato* to take a different scope from *-man<sub>2</sub>*.

#### 4. Conclusions and remaining problems

In this paper I argued that *-lato* can be decomposed into two subparts, the covert *-man<sub>2</sub>* and the overt *-to*, following decompositional analysis of alleged NPI *evens*, like *auch nur* or *anche solo*. Furthermore, I also argued that *-to* in *-lato* introduces the additive presupposition weaker than that of *also*, *auch* or *solo*. This decompositional analysis can account for the unique distribution and the semantics of *-lato*, without stipulating any NPI-like behavior.

Of course there are still remaining problems, among which I would like to address one - *-lato* and *amwu* ‘any’. As thoroughly examined in Choi (2007), *-lato* can combine with *amwu* (NP)- ‘any (NP)’, behaving like free-choice (FC) items *any* NP in English, as indicated in the interpretation of (41):

(41) *John-un amwu/etten-koki-lato mek-elswuiiss-ta.*

John-Top any/what-meat-lato eat-may/can-Decl

“John is allowed to eat meat: every meat is a possible eating option for John.”

(Choi 2007: 318)

Choi (2007) pointed out that the decompositional analysis of *-lato* made in this paper does not capture the FC flavor of *amwu* (NP) *lato*. For example, the presuppositions introduced by *-lato* in (41) are shown in (42), where we cannot derive the FC effect.

---

‘John read everything except *Barriers*.’ Only > Neg

b. *John-un Barriers-man ilk-[ci]anh-ass-ta.*

‘John read not only *Barriers* (but other books).’ Neg > Only

Since *-lato* is accompanied with an intonational cue, we may still conclude that both particles in *-lato* always takes wide scope over local negation.

- (42) a. LF:[ -to [  $\diamond$  [ -man [ John eats *amwu-/wh*-meat ] ] ] ]  
 b. ExclP of *-man* : John eats nothing different from *amwu-/wh*-meat  
 c. ScalarP of *-man*: *Amwu-/wh*-meat is the most likely meat for John to eat.  
 d. ScalarP of *-to*: *Amwu-/wh*-meat is the least likely for J. to be allowed to eat.  
 e. Weak Additivity of *-to*: There was an x different from *amwu-/wh*-meat such that if John eats nothing different from *amwu-/wh*-meat, and if x was the most likely meat for John to eat, then John is allowed to eat x.

(Choi 2007: 315ff)

To solve this problem, Choi (2007) claims, in parallel with Guerzoni's (2003, 2006) analysis of *auch nur* and *anche solo* (and therefore mine), that *-lato* introduces three different presuppositions, the exclusive one, the additive one, and the scalar one. Unlikely to those analyses, however, Choi (2007) also claims that: i) *-lato* does not introduce a weak additive presupposition, but the (usual) additive presupposition, and ii) the exclusive presupposition is not projected globally, but is accommodated locally. For instance, in Choi (2007), the presupposition introduced by *-lato* in (41) will be as (43):

- (43) a. ScalarP: *Amwu/etten koki* (x), i.e., some meat (x) is the most likely or insignificant (amount/kind of) meat for John to eat.  
 b. ExclP: There is nothing different from *amwu/etten-koki* (x) that John eats.  
 c. ExistP: There is some other (amount/kind of) meat (y) such that John is allowed to eat y.  
 d. Assertion (together with locally projected presupposition): It is allowed that there is no different *amwu/etten-koki* (x) that John eats.

Even though in Choi's (2007) framework the FC-effect of *amwu* (NP) *lato* may be accounted for, she does not give us a satisfactory explanation of the behavior of *-lato* in general. First, as already pointed out by Choi(2007) herself, it is unclear in her analysis what motivates the local accommodation of the exclusive presupposition introduced by *-lato* in modal contexts. Furthermore, it is still unclear in Choi's (2007) analysis how to derive the negatively-biased yes/no questions. If local accommodation occurs in each of possible answers (in this case, the positive answer and the negative answer),<sup>5</sup> it seems that these accommodated alternatives seem not to show any clash with the existential presupposition, which is essential to derive the negative-bias in

---

<sup>5</sup> Following Guerzoni(2003, 2004), we assume Karttunen(1977)'s semantics of questions.

Guerzoni(2003, 2004)'s analysis (since the exclusive presupposition is accommodated). However, at this point I have no definite answer to the question of how the FC-effect of *amwu* (NP) *lato* can be analyzed in a compositional way, either.

# The myth of Hungarian focus

Edgar Onea Gaspar\*

University of Stuttgart  
edgar.onea@ling.uni-stuttgart.de

## Abstract

Due to a number of syntactic and semantic properties associated with preverbal focus in Hungarian, most prominently the exhaustiveness feature, “Hungarian focus” has led to the assumption of specific functional and semantic categories in cross linguistic literature and to the relatively widespread distinction between structural (identificational) and prosodic (information) focus. While there have been attempts to motivate such categories cross linguistically, the Hungarian data still remains the principle piece of evidence.

On the one hand, this paper presents a selection of the data and arguments in favor of a structural analysis of Hungarian focus and for the assumption that it involves exhaustification (or a similar semantic operation). But on the other hand, I will also present evidence for problems with this kind of analysis and claim that the aspectual structure of Hungarian might be relevant for a deeper understanding of the syntactic and semantic properties of Hungarian focus. Based on such considerations I will suggest that Hungarian focus could be analyzed without postulating a special kind of focus or any specific exhaustification operator at the syntax-semantics interface. Instead, I will suggest that exhaustiveness emerges from the interaction of different factors such as the pragmatics of focus and aspectual properties.

## 1. Focus and Hungarian focus

Since the work of Szabolcsi (1981, 1994) and É. Kiss (1998, 2006, 2008) Hungarian focus has become one of the best known and best studied notions of information structure. The general claim is that in Hungarian a particular functional projection is dedicated to a specific kind of focus that has been also called “exhaustive” or “identificational focus” and is often used synonymously for the term “operator focus”. So, in (1) the focused expression *Marit* appears in an immediately pre-verbal position analyzed as the focus projection and imposes a strongly exhaustive interpretation as given in the translation: if *Marit* appeared at some other position in the clause, the exhaustiveness effect would disappear regardless of the prosodic properties of the expression.

- (1) *Péter [Marit]<sub>F</sub> csókolta meg.*  
Peter Mary.ACC kissed PRF  
‘Peter kissed Mary (and noone else).’

---

\* This research has been partly funded by the SFB 732 Project C2 at the University of Stuttgart. I would like to thank the following people for discussion and helpful comments on different version of this paper or related talks: David Beaver, Agnes Bende Farkas, Beata Gyuris, Andreas Haida, Klaus von Heusinger, Hans Kamp, Katalin É. Kiss, Udo Klein, Arndt Riester, Anna Szabolcsi, Daniel Wedgwood, Henk Zeevat, Malte Zimmermann and all participants of the session Information Structure organized by Manfred Krifka and Caroline Féry at CIL Korea 2008. All and any shortcomings are my own responsibility.

There is a whole array of both syntactic and semantic/pragmatic evidence that the basic observation about Hungarian focus is on the right track and cross linguistic studies have also provided some additional support inasmuch as similarities between focus fronting constructions in other languages and Hungarian focus have been found.

Nevertheless, in this paper I will suggest an alternative analysis for Hungarian focus, without making so radical assumptions about different types of focus. In particular I will propose an analysis that derives exhaustiveness from the interaction between standard semantics of focus and verbal semantics in Hungarian. While the first motivation of this new analysis is related to the data and will become evident in the data section, there is also an additional motivation, i.e. that strong theoretical and cross linguistic consequences are drawn from the analysis of Hungarian focus which might turn out not to be necessary if this alternative analysis is, at least in principle, correct. There are three aspects of this: i) the question, how a very specific notion of exhaustive focus is compatible with more general notions of information structure, ii) whether an exhaustification operator needs to be assumed at the syntax-semantics/pragmatics interface and finally iii) whether focus movement needs to be assumed in syntax and if so, what kind of triggering conditions are assumed.

For the purposes of this paper the first two aspects are more relevant. In semantic and pragmatic theories of information structure Hungarian focus never was adequately integrated and mostly remained a more or less exotic exception. The main reason for this is that – given the significant variability in what the prosodic accent may indicate – the semantics of focus is generally treated as weaker. Note for instance the definition of focus given in Krifka (2007:18): “focus indicates the presence of alternatives that are relevant for the interpretation of linguistic expressions”. The punch line of the Hungarian focus argument is that cross linguistically (possibly as part of Universal Grammar) there is a special kind of exhaustive focus that differs from other kinds of focus by the semantic feature of exhaustiveness. While this does not directly contradict more standard pragmatic views on focus it gives rise to a quite different view of the role of focus in grammar. This is particularly striking if one considers that for a language like English it is not even clear whether we are entitled to assume any particular semantic import of prosodic prominence or whether prosodic prominence is rather a formal reflex of discourse structure in terms of givenness, prominence or activation (cf. e.g. Beaver & Clark (2008) and Büring (2008) for discussion).

Another way to pin down this point is that Hungarian focus is structural as opposed to prosodic focus. Structural focus is an overtly syntactic phenomenon and needs to have some effect on the compositional semantic value of sentences containing it. In this case, Hungarian focus seems similar to *it*-clefts in English. But then again, at a closer look, in Hungarian the structural focus is the rather unmarked case of what would count as prosodic focus in English and in Hungarian, as compared to the structural focus, the prosodic/in situ focus is pragmatically rather marked. If so, that would mean that the Hungarian pragmatics is – after all – quite radically different from English. The second aspect of the discussion, involves the question of the status of exhaustiveness between semantics and pragmatics. Hungarian focus, being arguably exhaustive at the syntax-semantics or pragmatics interface, is considered as one of the principle motivations for the assumption that an

exhaustiveness operator at a higher CP level should universally be assumed for any language. This claim is used e.g. by Fox (2006) for deriving scalar implicatures, while more globalist approaches would rather use exhaustiveness operators independently of syntax as implementation of more general pragmatic principles (e.g. Horn 1972, van Rooij & Schulz 2004).

Finally, another dimension of the discussion regards the interface between syntax and phonology. As discussed e.g. in Szendrői (2003) at some length, there are reasons to believe that the so called focus movement in Hungarian is in fact prosodically and not syntactically motivated. As opposed to this, Horváth (2005, 2006) argues that the alleged focus movement is in fact feature-checking syntactic movement which is independent of the notion of focus but rather motivated directly the exhaustiveness feature itself. É. Kiss (2008) defends the more traditional view that Hungarian focus cannot be reduced to prosodic or independently motivated syntactic movement. Again, this discussion is directly relevant to the question, how grammar deals with notions of information structure at the syntax-pragmatics interface.

In this paper I will argue that the situation regarding Hungarian focus may be somewhat more different than it has been assumed, because some potentially relevant factors have not been discussed sufficiently. In particular, I will argue that verbal semantics, more specifically, the aspectual properties of Hungarian is directly related to both the syntactic position and to the interpretation of focus in Hungarian. I assume that at least part of the special properties of Hungarian focus can be traced back to the peculiarities of the interaction between a more standard notion of focus and the aspectual system. In other words: it will be argued that Hungarian focus is in fact just plain and usual focus and the peculiarities that contribute to its mythical status can be derived from the aspectual system of Hungarian.

The paper is structured as follows. In the first part of this paper, I will discuss the principle data about Hungarian focus and show evidence for and against the exhaustiveness analysis already discussed in the literature. In the second part of the paper I will provide some new data connected to verbal semantics and aspectual variation interacting with focus interpretation and sketch the idea of an alternative analysis.

## **2. Hungarian focus and exhaustiveness**

This section presents the basic data about Hungarian focus and the principle arguments that favour the assumption that Hungarian focus is semantically exhaustive or at least exhaustive in a distinguished way. In the first part of this section I present the general data while I turn to the exhaustiveness arguments in the second part.

### *2.1. The data*

Word order in Hungarian sentences is not used to mark grammatical relations (subject, object etc.), which are entirely assigned by case, but to reflect information structure and scope. Hence virtually

any word order between arguments and verb is possible. The most neutral word order seems, however, SVO as shown in (2). Adverbs, temporal modifiers and other adjuncts may appear both pre- and post-verbally and the order of arguments and adjuncts both in pre- and post-verbal positions is relatively free.

- (2) *Péter meg-csókolta Marit.*  
 Peter PRF kissed Mary.ACC.  
 ‘Peter kissed Mary.’

If several arguments are in front of the verb they are considered topical in the sense of Reinhardt (1981), i.e. “what the sentence is about”, and if they or some of them are prosodically highlighted with an A-accent (Jackendoff 1972) the highlighted constituent must be adjacent to the verb as shown in (3). For the purposes of data presentation focus is used (as in most of the literature) as synonymous with F-marked in the sense of Selkirk (1996) or Schwazschild (1999). This notion will be significantly revised at the end of this section, so it is important to keep in mind that this particular use of “focus” is limited to this section.

Focused elements may appear post-verbally as well, as shown in (4). Crucially, an adverb may appear between the verb and a post-verbal focus but not between the pre-verbal focus and the verb.

- (3) [*Tegnap Péter*]<sub>Top</sub> [*MARIT*]<sub>F</sub> *látta*.  
 Yesterday Peter Mary.ACC saw  
 ‘Yesterday, Peter saw MARY.’
- (4) [*Tegnap Péter*]<sub>Top</sub> *látta* [*MARIT*]<sub>F</sub>.  
 Yesterday Peter saw Mary.ACC  
 ‘Yesterday, Peter saw MARY.’

There is one single case in which an adverb may occur between a pre-verbally focused expression and the verbal predicate: if the focused constituent is a quantifier like *minden* (‘every’) or an *is*(‘too’)-phrase. This phenomenon is illustrated in (5), but in such a case the adverb appearing between the verbal predicate and the focused *minden*-phrase or *is*-phrase is focused itself, although prosodically not bearing the main accent. In the literature such foci are known as second occurrence focus (cf. Rooth 1996). Note that in (5) any other adverb, argument or adjunct could appear instead of *tegnap* (‘yesterday’).

- (5) *Péter [minden lányt]<sub>F</sub> [tegnap]<sub>F</sub> látott.*  
 Peter every girl yesterday saw  
 ‘It was every girl that Peter saw just yesterday.’

Verbs in Hungarian may be simple such as *csókol* (‘kiss’) or complex. Complex verbs may contain an incorporated pre-verbal bare noun (i.e. a noun with no determiner as *fát-vág* (‘tree-chop’) (cf.

Farkas & de Swart (2003)) or a verbal prefix (PRF) as *le-vág* ('down-chop'). (I will ignore bare nouns in this paper completely.) The meaning of PRF in Hungarian interacts with the meaning of the main verb giving rise to mostly predictable meaning composites, as shown in (6), where the meaning of the composite *kiment* ('went out') is directly derivable from *ki* ('out') and *ment* ('went'). In most of the cases PRF are spatial prepositions expressing the direction of some motion and they also have impact on telicity and perfectivity of events expressed by verbal predicates. Simple verbs and complex verbs consisting of a BN and a verb are not perfective and usually a-telic as shown in (7) while complex verbs consisting of PRF and verb are telic and perfective as shown in (8)<sup>1</sup>.

(6) *Péter kiment.*

Peter PRF-went

'Peter went out.'

(7) *Péter (\*egy óra alatt) (egy órát) nézte Marit.*

Peter one hour under one hour.ACC watched Mary.ACC

'Peter watched Mary (\*in an hour) (for an hour)'

(8) *Péter (egy óra alatt) (\*egy órát) megnézte Marit.*

Peter one hour under one hour.ACC PRF-watched Mary.ACC

'Peter watched Mary (in an hour) (\*for an hour)'

A pre-verbal PRF bears the main stress of the verbal complex. This may be related to the fact the Hungarian has word-initial accent and pre-verbal PRF or BN form together with the verb a phonological word, cf. Szendrői (2001, 2003) for discussion. If a post-verbal focus occurs, the PRF remains pre-verbal and continues to bear the main stress of the verbal complex. However, if a pre-verbal focus occurs PRF appears post-verbally, as shown in (9). Excepted from this rule are (among others) cases in which the pre-verbally focused expression is a universal quantifier like *minden* ('every') or the focused expression is accompanied by *is* ('too') as shown in (10). In addition if the focused expression is a quantifier like *sok* ('many') or *több* ('more') PRF may appear both pre-verbally and post-verbally as shown in (11). Note that both for foci containing *sok*-('many') and *minden*('every') phrases PRF must appear post-verbally, if the stress is not on the quantifier but on the restrictor, as shown in (12).

(9) *Péter [Marit]<sub>F</sub> (\*meg)nézte meg.*

Peter Mary.ACC PRF-watched-PRF

'Peter watched MARY.'

(10) *Péter [Marit is]<sub>F</sub> megnézte (\*meg).*

Peter Mary.ACC too watched-PRF

---

<sup>1</sup> Verbal prefixes can often be used as perfectivity and telicity markers. This function of PRF is inasmuch central that the most frequent PRF *meg* does not have any spatial meaning, it is used just as an aspect marker and cannot be properly translated into English. Note, however that there are exceptions from this generalization, cf. Kiefer (2008) for details.

‘Peter watched MARY too.’

(11) *Péter [sok lányt]<sub>F</sub> (meg)csókolt (meg).*

Peter many girl.ACC kissed PRF

‘Peter kissed MANY GIRLS.’

(12) *Péter sok [lányt]<sub>F</sub> (\*meg)csókolt (meg).*

Peter many girl.ACC kissed PRF

‘Peter kissed many GIRLS.’

If a pre-verbal focus appears and PRF appears post-verbally it is de-stressed but if pre-verbal focus occurs and PRF still appears pre-verbally it is not de-stressed and bears the main stress of the verbal complex.

It has often been overseen in the literature that in Hungarian post-verbal focus does not mark the answer to a *wh*-question, while pre-verbal focus does, as shown in (13). The a. answer, in which the focused expression is pre-verbal, marks a natural answer to the question, while the b. answer, in which the focused expression is post-verbal, cannot be interpreted as a natural, direct answer to the question. The b. answer seems to require some continuation in which a contrasting expression to the focused expression appears, in other words the answer seems incomplete.

(13) *Ki csókolta meg Marit?*

Who kissed PRF Mary.ACC

‘Who kissed Mary?’

- a. *[Péter] csókolta meg Marit.*  
Peter kissed PRF Mary.ACC  
‘PETER kissed Mary’
- b. *? Marit megcsókolta [Péter].*  
Mary.ACC PRF-kissed Peter  
‘PETER kissed Mary’

Excepted from this observation are pre-verbal foci which do not trigger a post-verbal occurrence of PRF, such as the quantifier *minden* (‘every’) or – even more interestingly – in the case of *sok* (‘many’) which, if focused, allow both pre-verbal and post-verbal PRF: in (14) the a. answer is interpreted as an indirect answer to the question, indicating something like there is no point in asking how many girls since there were really many, while the b. answer marks *sok* (‘many’) as the direct answer to the question. Hence the descriptive generalization is that pre-verbal focus marks the direct, natural answer to a question exactly in case PRF appears post-verbally, and fails to do so if PRF appears pre-verbally.

(14) *Hány lány csókolta meg Pétert?*

How-many girl kissed PRF Peter.ACC

‘How many girls did kiss Peter?’

- a. *Pétert [sok lány]<sub>F</sub> megcsókolta.*  
 Peter.ACC many girl PRF-kissed  
 ‘MANY GIRLS kissed Peter. (So don’t ask how many!)’
- b. *Pétert [sok lány]<sub>F</sub> csókolta meg.*  
 Peter.ACC many girl PRF-kissed  
 ‘MANY GIRLS kissed Peter. (And not just a few.)’

In all cases in which focus can mark the direct answer to a *wh*-question, i.e. if PRF are post-verbal, focus can also be used to contradict a previously made assertion, by replacing an argument of the former sentence by the focused expression. Again, in such cases post-verbal focus or the use of quantifiers that do not allow a post-verbal occurrence of PRF is pragmatically weird.

It is widely assumed that pre-verbal focus in Hungarian (at least if it co occurs with post-verbal PRF) gets an exhaustive interpretation. Hence (9) is interpreted as conveying the information that Peter saw Mary and only Mary. In other words, the observation is that if focus marks the direct answer to a question, we get an exhaustive interpretation.

Given the difference between different foci at different positions in a Hungarian clause some additional classification appears to be necessary:

(15) Different types of foci in Hungarian:

- a. I call a focused expression a **F<sub>1</sub>** if it is
- (i) pre-verbal and
  - (ii) if a PRF is present it occurs post-verbally and
  - (iii) the focused expression can mark the direct answer to a *wh*-question.
- b. I call a focused expression a **F<sub>2</sub>** if it is
- (i) post-verbal or
  - (ii) pre-verbal and if a PRF is present it occurs pre-verbally and
  - (iii) the focused expression does not mark the direct answer to a *wh*-question

Note that this terminological distinction is made or presupposed (in a compatible way) in virtually any paper on Hungarian focus, however the labelling is somewhat different: e.g. **F<sub>1</sub>** has been also dubbed *identificational focus*.

## 2.2 The exhaustiveness discussion

The basic observation made in the literature about **F<sub>1</sub>** in Hungarian is that it is semantically very similar to English *it*-clefts. This observation is one of the main motivations that lead É. Kiss (1998) to assume that **F<sub>1</sub>** in Hungarian can be viewed in a broader context in which so called “in situ” focus can be distinguished from “moved” focus by the existence of some features like [ $\pm$ exhaustive] and [ $\pm$ contrastive] which in different languages trigger focus-movement in different combinations.

Indeed, when it comes to exhaustivity, the comparison of **F<sub>1</sub>** in Hungarian with *it*-clefts holds over a

number of tests. Maybe the most convincing of these is that in expressions that are excluded from F<sub>1</sub> in Hungarian e.g. in (10) *it*-clefts are excluded in English as well, as shown in (16).

(16) ??*It was PETER too, who kissed Mary.*

The claim that F<sub>1</sub> in Hungarian is strictly exhaustive, has been advocated in two different ways.

On the one hand it has been assumed that there is a covert exhaustivity operator in the immediately pre-verbal position in Hungarian, which can account for the [+exhaustive] feature of F<sub>1</sub>. This operator is very similar to the focus sensitive particle ‘only’. This implicates that even though *it*-clefts and F<sub>1</sub> in Hungarian are similar, they get exhaustivity effects in different ways: *it*-clefts via presupposition and F<sub>1</sub> in Hungarian via an exhaustivity operator. Of course this argument only works if one assumes that F<sub>1</sub> and pre-verbal F<sub>2</sub> occupy distinct syntactic positions, since otherwise F<sub>2</sub> (that is nevertheless pre-verbal) would also be predicted to have an exhaustive reading.

This exhaustification-operator argument has received some criticism in the literature. It has been shown for instance that this exhaustive reading is achieved without a covert ‘only’. Wedgwood (2005), based on an example going back to Horn, provides an example showing that there is no covert ‘only’ in the pre-verbal position in Hungarian. If there were a covert ‘only’ in the pre-verbal position, one would expect not only (18) but also (17) to be acceptable in Hungarian, which however is not the case.

(17) ??*Azt tudtam, hogy Mari megevett egy pizzát, de most vettem észre,*  
 that knew.I.SG that Mary ate a pizza.ACC but now took.I.SG notice  
*hogy [egy pizzát]<sub>F</sub> evett meg.*  
 that a pizza.ACC ate PRF

Intended reading: ‘I knew that Mary ate a pizza, but I have just noticed that it was (only) a PIZZA she ate.’

(18) *Azt tudtam, hogy Mari megevett egy pizzát, de most vettem észre,*  
 that knew.I.SG that Mary ate a pizza.ACC but now took.I.SG notice  
*hogy csak [egy pizzát]<sub>F</sub> evett meg.*  
 that only a pizza.ACC ate PRF

‘I knew that Mary ate a pizza, but I have just noticed that it was only A PIZZA she ate.’

É.Kiss (2007) argues that the contrast between (17) and (18) only shows that the covert operator is not a full fledged ‘only’ and not that there is no exhaustivity operator. In her view ‘only’ has some discourse function, such that ‘only’ is an evaluative particle marking that on a scale of alternatives the focus represents a non-maximal value, while the covert exhaustivity operator has only truth conditional effects. The same view is also advocated by Horváth (2006).

Another kind of counter-evidence for the exhaustivity operator approach is based on examples like (19) provided by a corpus study of Wedgwood et al. (2007). The argument is, that if in (19) *Marit* is an instance of F<sub>1</sub>, which according to the definition it must be, the exhaustivity operator must be

applied to the phrase ‘among others Mary’. But this simply contradicts exhaustification. The point here is not only (as it might seem) that an exhaustive reading does not arise (since in some way the operator might be neutralized by the expression itself) but rather why  $F_1$  is used if exhaustification is not intended.

- (19) *Péter többek között [Marit]<sub>F</sub> csókolta meg.*  
 Peter among others Mary.ACC kissed PRF  
 ‘Peter kissed among other MARY’

The other way to derive exhaustiveness involves a presuppositional effect (Kenesei 1989, 2005, Szabolcsi 1994). The idea is that  $F_1$  in Hungarian exhaustively identifies a term presupposed by the rest of the sentence. Note that identifying a presupposed entity does not necessarily yield a semantically encoded exhaustivity effect. Hence, in most approaches of this kind the presupposition is viewed as something similar to a definite description. According to such analyses the semantics of the immediately pre-verbal position in Hungarian includes an operator that compositionally turns the focused expression to an identificational term applied to a definite description:  $\lambda x \lambda P [x = \iota y [P(y)]]$ , where P stands for the background (Krifka 1992) and x for the referent of the focused expression<sup>2</sup>. Hence, for instance in (9) we get a partition of the sentence into a focus: *Mary* and a background:  $\lambda x$  *Peter kissed x*, and the exhaustivity operator applied to these expressions yields:  $Mary = \iota y [\lambda x$  Peter kissed x (y)].

A presupposition associated with focus has been widely discussed in the literature. Similarly such a presupposition can be assumed for *it*-clefts in English, as e.g. in Rooth (1999), but the exhaustivity effect is usually derived pragmatically in order to avoid standard issues with plurals etc. If however for Hungarian uniqueness is included into the presupposition, this leads to serious problems as soon as even simple plurals have to be discussed. These problems can be solved, but solutions are not trivial. (Note that in Hungarian “nobody” can be in  $F_1$ .)

The two main approaches briefly introduced above have been rejected in Wedgwood (2005) and Horváth (2006). Horváth (2006) rejects the mentioned approaches arguing that the so called focus position is indeed exhaustive in nature, just that it has nothing intrinsically to do with focus. In her view, the immediately pre-verbal position is interpreted as an operator of exhaustive identification, which is focus sensitive and hence has a strong tendency to be a good attachment site for focused expressions, but it may host also non-focused elements and focused elements may appear in other positions as well, even in cases in which the immediately pre-verbal position is occupied by a non-focused expression. Examples like (5) are central to her approach because they show that the immediately pre-verbal position is exhaustive even if the main prosodic focus is elsewhere in the clause. Indeed for this kind of examples her analysis makes the right predictions and it has to be noted that this is the only analysis “on the market” making those right predictions.

---

<sup>2</sup> These notions are generally associated with a structured-meaning approach to focus whereby the general idea is that focus triggers a partition of meanings into a focus and background-part, which applied to the focus denotation, yields the ordinary truth conditions of the sentence (cf. Krifka 2007 for introduction).

However: Horváth treats *tegnap* ('yesterday') as unfocused, while I introduced a focus marking for *tegnap* arguing that this is an instance of a second occurrence focus, which does not need to bear a pitch accent but arguably still is prominent in a particular way (cf. Beaver et al. 2007 and Beaver & Clark 2008 for English). But of course, second occurrence focus *can* bear a pitch accent and indeed speakers tend to place a pitch accent onto the adverb as well, even though it is clearly not the main accent of the sentence.

On Horváth's approach a crucial fact is not accounted for: the fact that only very few quantifiers can appear in the pre-pre-verbal position, as in (5), namely *minden* ('every') and *is*('too')-phrases, which can be focused pre-verbally without triggering the post-verbal appearance of PRF, while e.g. *sok* ('many'), which also can be focused pre-verbally without triggering the post-verbal appearance of PRF, or other expressions like names or definite NPs cannot, as shown in (20).

- (20) \**Péter [sok lányt]<sub>F</sub> tegnap/[tegnap]<sub>F</sub> csókolt meg.*  
 Peter many girl.ACC yesterday kissed PRF  
 'Peter kissed MANY GIRLS yesterday'

The most likely interpretation of (5) is, as correctly predicted by Horváth, that Peter saw not only some but every girl exactly yesterday (and on no other day), however such a sentence may only be used in Hungarian to contradict implicatures that might arise from 'Peter saw Mary YESTERDAY', by pointing out that there is no special thing about Peter seeing Mary exactly yesterday since in fact this is not only true for Mary but for all of the girls. Of course in such a case examples like (5) do not necessarily show that the pre-verbal position is independent of focus but rather that second occurrence focus may but needn't be significantly distressed in Hungarian, while it may still appear in an immediately pre-verbal position. In this case 'every girl' is a focus indicating a contradiction and 'yesterday' is a second occurrence focus. But then the crucial question is, why can't the second occurrence focus appear pre-verbally if the focused expression is a *sok*('many')-phrase as in (20), while the second occurrence focus may appear in the post-verbal position in a similar construction, as in (21).<sup>3</sup>

- (21) *Péter [sok lányt]<sub>F</sub> csókolt meg [tegnap]<sub>F</sub>.*  
 Peter many girl.ACC yesterday kissed PRF  
 'Peter kissed MANY GIRLS yesterday'

Wedgwood (2005) extensively argues against the idea that the exhaustive nature of  $F_1$  is semantically encoded in Hungarian and attempts to derive that particular effect at the semantics-pragmatics interface. Crucially, he argues, that the expression in  $F_1$  is a predicate over an  $\varepsilon$ -term in the sense of Egli & von Stechow (1995), i.e. something like a definite description. Unfortunately, the predictions of Wedgwood (2005) regarding exhaustiveness are not so clear, since an  $\varepsilon$ -term does not presuppose uniqueness – in fact the very reason that it has been introduced for describing

---

<sup>3</sup> Note that this contrast has not been accounted for by any theory of Hungarian.

definite descriptions was to account for definite descriptions without a uniqueness presupposition. If enriched by a uniqueness presupposition, the analyses would have the same predictions as Szabolcsi (1994), otherwise it seems to derive a somewhat more fuzzy pragmatic exhaustiveness effect which cannot derive exhaustiveness as an entailment or some particularly stable inference.

Summing up the discussion,  $F_1$  in Hungarian has been argued to be semantically exhaustive and support exhaustivity at the level of entailment (as opposed to implicatures). While it is debatable whether this is a real case of entailment or not, the data require an analysis that at some level yields a strong exhaustiveness prediction. On the other hand there are counter examples and problems with this kind of analysis which suggest that at some level more has to be said about Hungarian focus: while exhaustiveness may be a fact about  $F_1$  in Hungarian, certainly more has to be said about it before one can draw the conclusion that there is something like “exhaustive” or “identificational” focus as part of grammar (especially if the claim is considered cross linguistically relevant).

### **3. An alternative approach**

My main point in this paper is that, given the complicated data and the complexity of the discussion about Hungarian focus, it may actually be the wrong strategy to try to reduce the whole question to the presence or absence of a semantic feature or operator. Certainly, any approach to Hungarian focus that does not accept the exhaustiveness facts and derives something weaker than what is needed to account for the data is doomed to failure. Similarly, any attempt to push the idea of an exhaustiveness operator as truth conditional part of the meaning of Hungarian sentences involving  $F_1$  is suspect given some of the data above.

So, one might consider a different strategy: why shouldn't exhaustiveness in the case of  $F_1$  focus simply be the effect of the interaction of different factors. Depending on the nature of the factors involved it might even be possible to sometimes derive exhaustiveness in terms of truth conditions at the level of sentence meaning, sometimes, this might be a possible outcome of contextual factors and sometimes this inference may not arise at all. This certainly seems to be just about the right description of the data.

In this paper I argue that two of the factors involved (whereas there may be more) are: (i) the semantic import of focus in general and (ii) the aspectual system of Hungarian and I will sketch a model that is able to deal with this kind of interaction. Concerning the first point I will argue that in Hungarian  $F_1$  is the only possible focus position and in fact  $F_2$  is not an instance of focus but rather of contrast in a more specific sense. Regarding the second point I will elaborate on an idea presented in Onea (2007) according to which the word order between verbal prefix and verb associated with  $F_1$  sentences is relevant for the semantic analysis of Hungarian focus.

#### *3.1. Focus and contrast in Hungarian*

A crucial part of the exhaustiveness argument for  $F_1$  in Hungarian is directly related to the

observation that  $F_1$  is very similar to English *it*-clefts. There is, however, a very important difference between them as well, namely that in Hungarian  $F_1$  marks a natural answer to a *wh*-question as discussed above (cf. example (13)), while English *it*-clefts, which are supposed to share at least some of the key properties of  $F_1$  in Hungarian, do not mark natural answers to *wh*-questions, as shown in (22).

Moreover in other languages in which something dubbed ‘focus movement’ is attested, there is absolutely no such effect as observed in Hungarian: For instance in Romanian both pre-verbal and post-verbal focus can mark natural answers to a question as in (23), though an answer containing a pre-verbal focus seems somewhat more natural.

(22) *Who did John see?*

- a. *John saw [Mary]<sub>F</sub>.*
- b. *? It was [Mary]<sub>F</sub>, John saw.*

(23) *Pe cine a văzut Ion?*

ACC Who did see John

‘Who did John see?’

- a. *Ion l-a văzut [pe Mihai]<sub>F</sub>.*

John CL-did see ACC Michael

‘John saw MICHAEL’

- b. *Ion [pe Mihai]<sub>F</sub> l-a văzut.*

John ACC Michael CL-did see

‘John saw MICHAEL’

This observation has two sides: first, even if we were to accept the presuppositional analysis, one still needs to explain why  $F_2$  is not a direct answer to a question while its semantic pendant in other languages seems to be, and second, why would only a strictly exhaustively identifying answer be a good answer to a question, while in English this (i.e. *it*-clefts) is not conceived as a natural answer to *wh*-questions.

One way to deal with this problem is to say that in Hungarian the function (or one of the functions) of  $F_1$  is precisely to mark the answer to a question, while  $F_2$  in Hungarian does not have this function. It is widely known that in languages like English or German, prosodic prominence (even involving A-accent) can have different functional motivations. Marking the answering constituent to a *wh*-question is one of those functions, as argued e.g. by Roberts (1996) or Büring (2000), while there may be other reasons as well, such as being a contrasted expression to some other expression in the discourse cf. Rooth (1992). Arguably such different functions of (or reasons for) prosodic prominence are semantically related in the wider sense that they all evoke alternatives, since marking the answering constituent to the question under discussion can be analysed as presupposing precisely the set of alternatives that constitute the semantic value of the question itself as proposed in Hamblin (1973). But then again, marking the answering constituent is a functionally clearly distinguishable function of prosodic prominence and as a matter of terminology one can reserve the

term “focus” for this particular function, while reserving the term “contrast” for the other cases of contrast in a wider sense. A similar terminological decision regarding the term “focus” is also made in Beaver and Clark (2008).

Let us, hence, call  $F_1$  “focus” and  $F_2$  “contrast”.

Of course this is not a solution to the problem, just a re-labeling. But the advantage of this terminological move is that it becomes clear that there is at least one semantic description of the function of focus in general that perfectly fits the Hungarian data at least regarding their syntactic distribution. From this, exhaustiveness does not follow semantically, but – since the answer to a question is generally interpreted as exhaustive in most contexts – there is reason to assume a pragmatic notion of exhaustiveness for Hungarian focus.

But what evidence is there actually for this rephrasing of the problem? Why would e.g. (10) not be a good answer to a question? Empirically, this is because one may only focus ‘every’ or ‘too’ phrases if this is meant to contrast to a former assertion or to a *wh*-question word, which is hence conceived as “the wrong way of putting the question”. From a rather formal point of view, one may put it this way: let both contrast and focus generate alternatives, hence fall under a wider notion of focus in the sense of Krifka (2008), but let focus generate complete clauses as alternatives while contrast generates singular expressions as alternatives. Crucially, a set of clausal alternatives is a question-presupposition, hence we get immediately that a focus answers a question under discussion. For contrast the presupposition is not a question but some constituent to which the  $F_2$  constituent is contrasted. This immediately predicts that as an answer to a question  $F_1$  is preferred over  $F_2$  and as a contrast to some constituent,  $F_2$  is preferred over  $F_1$ .

To make this point more explicit I will adopt the compositional system of Alternative Semantics (Rooth 1992) with minor modifications:

$\varphi$  is an expression,  
 $\|\varphi\|^O$  is the ordinary semantic value of  $\varphi$  and  
 $\|\varphi\|^F$  is the focus semantic value of  $\varphi$ .

Rules for determining  $\|\varphi\|^F$

$$\begin{aligned} \|\varphi\|^O &= \|\varphi_F\|^O \\ \|\varphi\|^F &= \{\|\varphi\|^O\} \\ \|\varphi_F\|^F &= D_{\text{type}(\|\varphi\|^O)} \end{aligned}$$

Compositional rules:

$$\begin{aligned} \|\alpha \beta\|^O &= \|\alpha\|^O(\|\beta\|^O) \\ \|\alpha \beta\|^F &= \{ \alpha'(\beta') \mid \alpha' \in \|\alpha\|^F, \beta' \in \|\beta\|^F \} \end{aligned}$$

Additional rule: in the composition of the focus semantic value presuppositions do not project to the level of alternatives<sup>4</sup>

At the level of focus interpretation a set presupposition arises. The presupposition is modeled as a free set variable  $\sim C$  with the following conditions:

---

<sup>4</sup> The alternatives do not need to be presupposed. This is an extension of the framework and tackles the problem of definite descriptions in Alternative Semantics (von Stechow 2008). The problem is that the alternatives to a definite term are alternative definite descriptions and if they were presupposed in the discourse wrong results would be predicted. For an independent motivation of a similar assumption, cf. Oëna & von Stechow (2008).

$$C \subseteq \|\varphi_2\|^F$$

$$\exists \psi [p \neq \|\varphi_2\|^O \wedge \psi \in C]^5 \quad (\psi \text{ is not restricted for type})$$

For  $F_1$   $\sim C$  is at the clause level.

For  $F_2$   $\sim C$  is at the constituent level.

Hence, alternatives to a clause containing  $F_1$  are a set of entities of type  $t$ , while for a clause containing  $F_2$  only a set containing entities of type  $e$  are generated.

By saying this, I still have told why and how this semantic difference arises: one may assume that there is a particular blocking effect in Hungarian i.e. the alternative calculation in the sense of Rooth (1992) may collapse at a certain syntactic projection as argued in Onea (2007 and 2008), or that clause-level alternatives are restricted by syntax or by some operator to this peculiar position. Even a bidirectional OT analysis is conceivable, which would derive the unmarked alternatives (i.e. the clause level alternatives) for the unmarked focus position and marked alternatives (i.e. constituent level alternatives) at any other position. But for the proposal to be made here this is not of central interest, since deriving clause level alternatives on its own yields at best some pragmatic exhaustiveness effect, as it has been argued for focus and contrastive topics even in English (e.g. by van Rooij (this volume), so for such an account it is crucial to have some more to say about the other factors involved in Hungarian sentence structure or event structure.

### 3.2 Events and Focus in Hungarian

An important fact about focus that I want to present here is associated with the de-accenting of the verbal prefixes. This de-accenting is not of the same kind as in the case of the occurrence of contrast: the prefix does not bear the main stress of the clause if a contrast is present, but still the main stress of the verbal predicate is on the prefix, however if a focus is present the prefix is totally de-accented. The fact that the prefix is de-accented and appears in post-verbal position in case of a focus could be a mere phonological fact about Hungarian or it could be relevant to semantics. If the former is the case, then there is not significantly more to say about it. However, if the latter is the case, than one could assume that the fact that a prefix loses prominence in Hungarian may trigger some semantic effects that on their turn could interact with the semantics of focus and lead to exhaustiveness effects. Our task then is to find out what this semantic effect could be and how it would interact with the semantics of focus.

I have argued above that if a verbal prefix appears pre-verbally (usually) telicity and perfectivity effects arise as shown in (7) and (8). However, if verbal prefixes appear post-verbally, telicity effects associated with them are significantly weakened, while the spatial meaning of the prefixes is still present in the composition: while a-telic temporal modification (e.g. *egy óra hosszat* or *egy órát* ‘for an hour’) is not appropriate if the prefix is pre-verbal as shown in (8), it gets significantly better if the prefix is post-verbal. Moreover, the more the directional element expressed by the prefix is inherent to the verb or, in other words, the less relevant the directional component for the

---

<sup>5</sup> As opposed to Rooth(1992) there is no constraint that the ordinary semantic value  $\|\varphi\|^O$  is part of the presupposed set.

understanding of the event, the worse a-telic modification with post-verbal prefixes gets, as shown in the contrast between (24), (25) and (26). Note that in (24) the spatial semantic import of “down” is significant, since one could also imagine a context in which carrying the boxes to the third floor is a carrying up and not a carrying down operation, but in (25) the directional component is inherent to the verb (no other prefix is likely to be used for *mos* (‘to wash’) in Hungarian) and in (26) there is no directional component at all. In contrast, telic verbal modification (i.e. *egy óra alatt* ‘in an hour’) is appropriate in any case if a prefix is present (either pre- or post-verbally).

- (24) [Egy óra hosszat]<sub>F</sub> vittem le a dobozokat a harmadik emeletre.  
 One hour long.ACC carried PRF the boxes.ACC the third floor-to  
 ‘I carried the boxes down to the third floor one hour long’
- (25) ?? [Egy óra hosszat]<sub>F</sub> mostam ki a nadrágomat.  
 One hour long.ACC washed PRF-the trousers.my.ACC  
 ‘I washed my trousers for an hour’
- (26) \* [Egy óra hosszat]<sub>F</sub> írtam meg a leveleket.  
 One hour long.ACC wrote PRF the letters.ACC  
 ‘I wrote the letters for one hour.’

Note that the existence of a focus is not the only possible reason for a prefix to appear post-verbally. In *wh*-questions (27) and after negation (28) prefixes appear post-verbally as well. In the presence of bare nouns prefixes appear post-verbally as well, as shown in (29). (29) is in fact the only pattern in which prefixes can co-occur with bare nouns, i.e. it is not possible to have pre-verbal prefix and a post verbal bare noun. This is little surprising given that they impose different telicity effects and if the prefix is post-verbal its telicity effect is strongly reduced, as shown above.

- (27) *Ki (\*oda)adott (oda) Marinak egy könyvet?*  
 Who PRF-gave PRF MARY.DAT a book.ACC  
 ‘Who gave Mary a book?’
- (28) *Péter nem (\*oda)adott (oda) Marinak egy könyvet.*  
 Peter not PRF-gave PRF Mary.DAT a book.ACC  
 ‘Peter did not give Mary a book.’
- (29) *Mari lámpá(ka)t szerelt fel a plafonra.* (Farkas & de Swart 2003)  
 Mari lamp.(PL).ACC set.Past PRF the ceiling.on  
 ‘Mari set up a lamp(s) on the ceiling.’

Wedgwood (2005) argues that the immediate pre-verbal position, which is shared between focus and verbal prefixes in complementary distribution, is semantically interpreted as the main predication of Hungarian sentence structure. The general idea of Wedgwood’s approach is that the meaning of a sentence is incrementally constructed in the process of interpretation in a dynamic system of predications, whereas for Hungarian the immediate pre-verbal position is the point where

the final – proposition creating act of predication takes place. As mentioned above, this leads Wedgwood to assume that focus is nothing but a predicate over a definite description, but he have already seen that this is not quite enough to account for the data.

One particular way to tackle this problem which is quite similar to Wedgwoods analysis would be to assume that pre-verbal prefixes (among other things they may do) contribute the existential quantification over the event introduced by the verb. Crucially, if the verbal prefix appears post-verbally, this leads to the effect that the event of the verb is not introduced into the discourse but rather presupposed. If, however, the event is presupposed, it will be predicted to be co-referential with the event under question – given that focus already indicates that the question answers a specific question under discussion. If, finally, the question is predicted to ask for a participant of a specific event, and the answer is referring to that particular event under question, exhaustiveness is very likely to emerge. This idea has been proposed in Onea (2008) and a similar line of thinking has been also proposed for Chinese in Hole (2008), where a presupposition is implemented which requires one and only one event of the type specified by the CP in the context.<sup>6</sup>

Pseudo-formally, this can be represented as follows:

We assume existential quantification to be the semantic role of the pre-verbal position:

(EXIST)-V-PRF:  $(\partial\exists e. ASP(e) \wedge V(e)) \wedge (\lambda e'. rest\_of\_sentence(e'))(e)$

PRF+EXIST-V:  $\exists e. ASP(e) \wedge V(e) \wedge rest\_of\_sentence(e)$

Unfortunately such a solution – how formally explicit it may be – is dependent on the assumed event ontology. Exhaustivity is predicted if and only if the event ontology predicts that one event has one particular participant (may it even be a sum individual), if discontinuous events with different participants are allowed exhaustivity is not so clearly predicted.

Nevertheless, such an approach, if the event ontology is defined properly, is able to predict exhaustivity pragmatically without assuming a specific operator in Hungarian or without assuming any language specific rules for interpreting Hungarian focus.

Moreover, the approach not only copes with the standard examples of exhaustiveness but even makes more refined predictions than other theories. Consider the famous example given in (30) from Szabolcsi (1981), which would be a contradiction if the first part of (30) would not mean something like ‘Peter (and only Peter) slept on the floor’. While Szabolcsi explains this in terms of an exhaustiveness operator, the current approach would explain it as emerging from the fact that we interpret (30) as specifying the participants of a particular event. If so, the continuation is acceptable, because the continuation corrects the participant of a particular event.

(30) *Nem [Péter]<sub>F</sub> aludt a padlón, (hanem [Péter és Pál]<sub>F</sub> (aludt a padlón)).*

Not Peter slept the floor-on but Peter and Paul slept the floor-on

‘It isn’t Peter who slept on the floor; (it’s Peter and Paul who slept on the floor.)’

---

<sup>6</sup> Note that the only essential difference to Wedgwoods (2005) approach is that the exhaustiveness is not meant to be derived from the presupposition in this view but rather from the interaction between the presupposition and the question under discussion.

But then it would be predicted that (31) is acceptable if we think of Peter and Paul getting a ten grade together while unacceptable if they've got these grades for different works. Some speakers tend to accept this prediction, but unfortunately the data is not as solid as it would need to be to provide clear evidence for the analysis, as Anna Szabolcsi (p.c.) pointed out to me. In addition, it is not trivial to see, how such an account can be extended to stative verbs and to simple verbs as has been argued by Ferenc Kiefer (p.c.). In fact, it has to be shown, how exactly, the current proposal should be applied to (30) or (31) at all, given that they do not have PRF. One solution would be to assume a zero-PRF for those cases.

- (31) <sup>??</sup>*Nem PÉTER kapott tizest, hanem Péter és PÁL (kapott tizest).*  
 Not Peter got ten.ACC but Peter and Paul got  
 ten.ACC  
 'It isn't Peter who got a ten (grade), it's Peter and Paul who got a ten (grade)'

Even though this sketch of an analysis does not handle all the data and makes predictions that are empirically not quite clearly confirmed, for the aims of the current paper it shows that the data concerning Hungarian focus are more complex than they might have seemed to be. There are factors involved which have been seen as little relevant in the literature, but as pointed out by Wedgwood (2005) this is more likely to be due to framework-internal considerations. If, as I hope to have shown in this paper, such factors are treated as semantically relevant the exhaustive feature of Hungarian focus might boil down to the interaction between different factors instead of one single operator.

#### 4. Conclusion

I conclude that the least the possibility of such an argument shows is that one can think of Hungarian focus not as exhaustive focus hard-wired into the syntax-semantics interface but rather as exhaustive by emerging from the interaction of different factors which are peculiarities of Hungarian: one of them is the generalization that focus and contrast can be separated syntactically in Hungarian (which is not that common for other languages) and the other one is the word order effects associated with focus, verbs and prefixes. Of course, other factors may also be relevant.

If so, Hungarian focus may turn out to be less exotic than it was pretended to be: a rather usual notion of focus would suffice to describe it if further factors are also taken into consideration. To finally clarify the situation, certainly, more research has to be conducted – and specifically the cases in which the intuitions are less clear, should be empirically discussed.

19 rue des Bernardins, F-75005 Paris

[fhaml044@gmail.com](mailto:fhaml044@gmail.com)

## Abstract

In this paper, we argue for a prosodic approach (Samek-Lodovici 2005) to the preference for cleft-sentences over canonical sentences in two focusing contexts in French: answers to subject constituent questions and contrastive [+/- corrective] contexts. Our proposal is that the ranking SF >> EPP,HI >> HU >> \*STRUCTURE is responsible for the emergence of cleft-sentences in answers to subject constituent questions and the emergence of canonical sentences in answers to non-subject constituent questions. As for contrastive [+/- corrective] cleft-sentences, we propose to treat them as cases of nested foci, in the same line as the analysis offered by Féry & Samek-Lodovici (2006) for so-called *Superman* sentences.

**Keywords:** French, cleft-sentences, prosody, subject focusing, nested foci, typology.

## 1. Introduction

Languages vary in the extent to which they use cleft-sentences and also in the contexts in which they use them. The fact that French speakers tend to use cleft-sentences as answers to subject wh-questions has been noticed by Belletti & Leonini (2004) in their experimental investigation of French learners of Italian as well as by Lambrecht (2001), who claims that focused constituents are excluded from the preverbal subject position in French. Lambrecht discards the possibility that this ban on preverbal foci in French follows from a phonological requirement, and suggests that instead, “the relevant constraint operates at the level of the mapping of syntax and information structure, prohibiting the occurrence of focus elements in preverbal subject position”. The same view is advocated by Zerbian (2005, 2006, 2007) in her OT account of Northern Sotho, a Bantu language spoken in South Africa which exhibits a subject/non-subject asymmetry strikingly close to the one observed in French. The aim of this work is to consider the alternative according to which the ban on focused preverbal subjects in French follows from

phonology, and more particularly from the fact that, although the preverbal position can host a pitch accent, it cannot receive the main stress of the clause. We argue that, in French, the preference for cleft-sentences over canonical sentences in subject focusing follows from the high ranking of the constraint which requires that a focus be most prominent in its focus domain (SRESSFOCUS), the tie on EPP, which requires that clauses have overt subjects, and HI, which requires that the head of an intonation phrase be aligned with its right boundary and the ranking of \*STRUCTURE below these constraints. What about non-subject cleft-sentences? Although they are excluded from information focus contexts, they are well formed and often preferred to canonical sentences in some contrastive contexts. We propose an account of these cleft-sentences in the same line as the one proposed by Féry & Samek-Lodovici (2006) (henceforth F&SL) for so-called *Superman* sentences, that is, a type of nested foci which constitute an exception to rightmost stress. Finally, we propose that our analysis extends to corrective cleft-sentences, which in our view constitute an instance of free second occurrence focus. The paper is organized as follows. Section 2 presents the French in 2.1 as well as the NS data and Zerbian's syntax-information structure interface account in 2.2. Section 3 is dedicated to our prosodic account of French cleft-sentences: section 3.1 concentrates on non-contrastive cleft-sentences and section 3.2 on two types of contrastive clefts. Section 4 concludes the paper.

## 2. Subject/non-subject asymmetry in French and Northern Sotho's information focusing

### 2.1. French subject focusing

In their L2 acquisition experimental study, Belletti & Leonini (2004) (henceforth B&L) observe that non-advanced French L2 speakers of Italian produce cleft-sentences with a very high percentage in contexts where the Italian verb-subject order is expected that is, in focusing subject contexts. This is illustrated in the following data (B&L 2004: 111).

- (1) A: Chi ha portato questi fiori?  
 'Who brought these flowers?'  
 B: ha portato i fiori una donna. (L1 speaker)  
 has brought the flowers a woman  
 C: E' una donna che ha portato i fiori. (L2 speaker )  
 is a woman who has brought the flowers  
 'It is a woman who has brought the flowers.'

As observed by B&L, the French learners of Italian investigated in their study tend to

transfer the strategy of their L1 to their L2 and consequently, to produce a cleft-sentence in a context where Italian speakers would produce a verb-subject inversion. Lambrecht (2001:491) also acknowledges the fact that French is similar to Spanish and differs from languages such as English and German in that the focus is banned from the preverbal position. Indeed, for many French speakers, the most common way to answer a question such as the one in example (2A) is by means of cleft-sentence (2B)<sup>1</sup>. However, in object and adjunct focusing, canonical sentences are preferred to their cleft-sentence counterpart. This is illustrated in the subsequent examples.

- (2) A: Qui est-ce qui mange un biscuit?  
 who is-it that eats a cookie  
 ‘Who is eating a cookie?’  
 B: C’est Thomas qui mange un biscuit.  
 it-is Thomas that eats a cookie  
 ‘It is Thomas that is eating a cookie.’
- (3) A: Qu’est-ce qu’il mange?  
 what is-it that he eats  
 ‘What is he eating?’  
 B: # C’est un biscuit qu’il mange.  
 is-it a cookie that he eats  
 ‘It is a cookie that he is eating.’  
 B’: Il mange un biscuit.  
 he eats a cookie  
 ‘He is eating a cookie.’
- (4) A: A qui est-ce qu’il parle?  
 ‘Whom is he talking to?’  
 B: # C’est à Marie qu’il parle.  
 ‘It is Mary that he is talking to.’  
 B’: Il parle à Marie.  
 ‘He is talking to Mary.’
- (5) A: Où est-ce qu’il va?  
 ‘Where is he going?’  
 B: # C’est à la maison qu’il va.  
 ‘It is at home that he is going.’  
 B’: Il va à la maison.  
 ‘He is going home.’

The label ‘cleft-sentence’ refers to the sentences from (2B) to (5B), bi-clausal structures divided into a matrix clause (TP) and a relative-like clause (CP). In a context such as the one provided in (2A), the relative clause in (2B) can simply be omitted, yielding what is usually referred to as a ‘reduced’ cleft-sentence.

There is a vast literature on cleft-sentences, as they have long been an object of interest. From a syntactic perspective, we assume the analysis proposed for French cleft-sentences by Clech-Darbon, Rebuschi & Rialland (1999) (henceforth CR&R). The syntactic structure they propose appears in (6) below.

(6) [IP [IP C'est<sub>i</sub> [VP t<sub>i</sub> [DP Ella]]] [CP Op<sub>j</sub> [C' qui [IP t<sub>j</sub> a mangé [DP un biscuit]]]]

Their approach challenges Lambrecht's (2001:466 and references therein) constructional view of cleft-sentences, in arguing that they are the simple "amalgamation of independently occurring types of identificational sentences and relative clauses", namely that there is nothing in their semantic and syntactic properties that "cannot, or not entirely, be accounted for in terms of other properties of the grammar of a language or universal grammar and which therefore require independent explanation". In their view, the matrix clause is a typical identificational TP, whose specifier is occupied by the demonstrative pronoun *c'*. Their analysis is "maximally simple" in that there is no movement other than that of an abstract relative operator within the relative-like clause. The functional category heading the relative-like CP is *qui* when the clefted constituent, that is, the complement of the copula, is the logical subject of the verb within the CP and *que* in all the other cases. As acknowledged by CR&R, French admits no explicit relative pronoun as head of this CP. This is illustrated in the following examples, in which the presence of an explicit relative marker forces to interpret the sentences as presentational sentences involving a genuine restrictive relative clause and discard the cleft-sentence reading.

- (7) C'est la maison dans laquelle j'ai dormi.  
 It-is the house in the-which I-have slept  
 'This is the house in which I slept.'
- (8) C'est la fille à qui j'ai confié Fido.  
 It-is the girl to whom I-have entrusted Fido  
 'This is the girl to whom I entrusted Fido.'

In their analysis, they treat the functional category heading the CP in cleft-sentences as a complementizer (Comp) and assume that an abstract relative pronoun covertly moves from an argument/adjunct position to Spec,CP. Although we agree with their analysis, we depart from it in the following respect: we adopt the view advocated by Taraldsen (2002) that, in Standard French, the form *qui* which emerges in so-called cases of 'subject-extraction' is actually an amalgamation of the Comp *que* and an expletive subject pronoun *-i*. In some dialects of French, a subject pronoun explicitly occurs in this position. This is illustrated in the following example from a song by Loïc Lantoine<sup>2</sup>:

- (9) C'est nous qu' on s'ra les P.D.G.  
 It-is us that we will-be the C.E.O  
 'It's us that will be CEOs.'

Another argument comes from the fact that the frequent omission of the last segment of the expletive pronoun *il* has lead some speakers to re-analyse the string *qu'il* (Comp + expletive) into *qui*. This is illustrated in the subsequent example<sup>3</sup>:

- (10) (..) qui disent bien tout ce **qui** faut faire.  
 who say well all dem que + il is necessary to do

In other words, we take the view that the subject position within the relative-like clause of a ‘subject’ cleft-sentence is not empty but overtly filled by an expletive *-i*, which attaches to the Comp *que* and yields the form *qui*.

To sum up: In the context provided by subject constituent questions of the type *qui/qu’ est-ce qui*, the most common way to answer in French is by means of a cleft-sentence, whereas in non-subject questions of the same wh-word + *est-ce que* type, cleft-sentences are inappropriate and canonical sentences preferred. We now turn to another language which exhibits the same behaviour with respect to answering constituent questions.

## 2.2. Northern Sotho

The subject/non-subject asymmetry observed in French has been observed in other languages and more particularly in some Bantu languages<sup>4</sup>. Northern Sotho (henceforth NS), a SVO language spoken in South Africa, is among them. In her study of this language, Zerbian (2006, 2007) describes at length the contexts in which cleft-sentences are either the only or among the least marked alternative(s) in some discourse contexts. For reasons of lack of space and time, we will only concentrate on informational focus in the present work, and we leave the other areas mentioned by this author for future research.

There are several ways to question subjects in NS, however the one described by Zerbian as the most common is by means of a cleft-sentence<sup>5</sup>. Alternative structures are described as pragmatically more marked.

- (11) A: Ké mang a-nyaka-ng ngaka?  
 COP who CL1-look.for-REL CL9-doctor  
 ‘Who is looking for the doctor?’  
 B: Ké mo-kglabje a-nyaka-ng ngaka.  
 COP CL1-old.man CL1-look.for-REL CL9-doctor  
 ‘It is the old man who is looking for the doctor.’

The syntactic structure assumed in Zerbian (2006) for a sentence such as the one in (11A) or (11B) follows:

- (12) [<sub>CP</sub> Ke mang<sub>i</sub> [<sub>IP</sub> t<sub>i</sub> a-nyaka-ng ngaka]]

In NS, the cleft-sentence is characterized by the presence of the copula *ké*, which appears right before the subject. A relative affix, *-ng*, is attached to the final vowel of the verb and there is a change in the verbal morphology, as the subject marker *a* is used instead of the class marker *o*. The syntactic analysis adopted by Zerbian for NS is different in several respects from the one assumed for French and illustrated in (6). The structure in (12) is a mono-clausal structure in which the clefted constituent, here the

wh-word *mang* - considered as inherently focused - is assumed to move from its argument position within IP to a higher (specifier?) position in the CP domain.

Contrary to subjects, objects and adjuncts are both questioned and focused in-situ, as illustrated in the following question-answer pairs.

- (13) A: Mokgalabje ó-nyaka mang?  
 CL1-old.man 3rd.CL1-look.for who  
 ‘Who is the old man looking for?’  
 B: Mokgalabje ó-nyaka ngaka.  
 CL1-old.man 3rd.CL1-look.for CL9-doctor  
 ‘The old man is looking for the doctor.’
- (14) A: Mokgalabje ó-jwala mo-hlare neng?  
 CL1-old.man 3rd.CL1-plant CL3-tree when  
 ‘When is the old man planting a tree?’  
 B: Mokgalabje ó-jwala mo-hlare lehono.  
 CL1-old.man 3rd.CL1-plant CL3-tree today  
 ‘The old man is planting a tree today.’

NS’s asymmetry in subject/non-subject focusing has traditionally been accounted for by the claim that in this language the subject position is a topic position and, as a consequence non-topical elements cannot surface there. Zerbian’s (2007) (and references therein) optimal theoretic account is in the same line as traditional analyses. The hierarchical ranking of constraints proposed by this author is the following:

- (15) Northern Sotho: SUBJECT = TOPIC >> SUBJECT >> STAY >> FOC-SPEC >> \*STR

As mentioned above, NS’s canonical order is Subject-Verb-Object. As in English or French, the subject is assumed to move from a position inside VP to the specifier of a I-related head. This movement is taken to indicate that in this language the constraint Subject outranks the constraint Stay. Both constraints appear below.

- (16) SUBJECT: Sentences have overt subjects in SpecIP.

- (17) STAY: Don’t move constituents.

The constraint SUBJECT (Grimshaw 1997), also referred to as EPP (‘Clauses have an overt subject’), corresponds to Chomsky’s (1982) Extended Projection Principle. There are (at least) two trends with respect to the evaluation of this constraint. On the one hand, Zerbian (2007, and references therein) considers that SUBJECT is violated whenever the logical subject is not located in the subject position. For instance, the following example displaying an impersonal construction violates this constraint.

- (18) a. Go-fihla ba-eti. (from Zerbian 2006)  
 CL17-arrive CL2-guest  
 ‘There are guests arriving’

On the other hand, in Samek-Lodovici (2005) this constraint is violated whenever the ‘highest A-specifier -- or the specifier of I-related heads such as T<sup>o</sup>, Agr<sup>o</sup>, Neg<sup>o</sup>-- is not overtly filled’. Our own proposal (section 3) is in the same line as the latter approach, in

considering that impersonal constructions displaying an expletive in the preverbal subject position satisfy SUBJECT/EPP. As for the constraint STAY in (17), it has the effect of favouring absence of movement over movement and is violated by every trace (or copy) present in the derivation.

In order to account for the fact that a cleft-sentence is preferred to its canonical counterpart in subject focusing contexts, Zerbian proposes that the following interface constraint ranks above all the other constraints in NS:

(19) SUBJECT = TOPIC: The grammatical subject of the sentence must not be F-marked.

The interface constraint SUBJECT = TOPIC is violated whenever the subject position hosts a focused constituent. This constraint is reminiscent of Zerbian's (2006) constraint \*SUBJ/F-MARKED, and revolves around the notion of harmony. The view advocated in Zerbian (2006) is slightly different from the one defended in Zerbian (2007). \*SUBJ/F-MARKED was aimed at capturing the generalization that subjects do not have to be topics in order to appear in the preverbal subject position, but they have to be non-focused. The two constraints are equivalent, and they are derived through the harmonic alignment of two scales: the grammatical function scale (Subject > Non-subject) and the focus scale (Non-Focus-marked > Focus-marked). The idea is that the subject position attracts non-F-marked constituents over F-marked ones: the presence of a narrowly focused subject in the preverbal position is therefore "unharmonic" and the constraint \*SUBJ/F-MARKED is violated whenever this configuration occurs. The fact that in NS focused subjects never appear in the preverbal position leads Zerbian to conclude that SUBJECT = TOPIC outranks SUBJECT and STAY.

All else being equal, the constraint \*STRUCTURE (\*STR) favours less complex structures over more complex ones in terms of functional layers. Every additional functional layer incurs one violation of this constraint. The fact that cleft-sentences emerge in NS is taken to indicate that the constraint in (20) is not high-ranked in this language.

(20) \*STRUCTURE: Avoid structure.

Finally, the interplay of STAY with FOC-SPEC in (21) ensures that, in NS, object and adjuncts are focused in-situ.

(21) FOC-SPEC: Focused constituents must be in a specifier position.

Zerbian's FOC-SPEC is also an interface constraint. It maps an information structure category, namely focus, with a position in the syntactic structure. FOC-SPEC is parallel to the constraint OP-SPEC (Grimshaw 1997), which requires that operators such as wh-words be in a specifier position. This is the case in languages such as German and English, in which obligatory wh-movement in wh-questions can be accounted for by the

high-ranking of such a constraint. As *wh*-structure and focus-structure exhibit the same behaviour in NS, Zerbian proposes a reformulation of OP-SPEC into FOC-SPEC. This constraint is violated whenever a focused constituent is not located in a specifier position, as is the case in object and adjunct focusing in NS. Zerbian derives the in-situ focusing of these constituents through the ranking of STAY above FOC-SPEC.

To sum up, French and NS seem to share the same subject/non-subject asymmetry in the use of cleft-sentences in answers to constituent questions. As was illustrated above, in NS this asymmetry has been tied to the relation between syntax and information structure. This analysis is reminiscent of the one suggested by Lambrecht (2001:492) for French: “(...) *the relevant constraint operates at the level of the mapping of syntax and information structure, prohibiting the occurrence of focus elements in preverbal subject position*”. In the following subsection, we propose an alternative approach to the subject/non-subject asymmetry observed in informational focusing contexts, where the observed pattern is a consequence of the interaction of prosodic and syntactic constraints and relates the French data to what has been observed in English and Italian subject focusing.

### **3. A prosodic approach to French informational and contrastive focus**

#### *3.1. Towards an analysis of the French subject/non-subject asymmetry*

##### *3.1.1. Italian and English subject focusing*

We adopt an alternative path and propose an account of French in the spirit of the analyses which have recently been proposed for Italian and English subject focusing within OT (a.o. Szendrői 2001; Samek-Lodovici 2005). Contrary to the approaches previously cited, in which discourse influences syntax, in the present account the asymmetry is derived through the interplay of prosodic and syntactic constraints. Our account is based on the claim that, contrary to what has long been assumed, pitch accent is not the main correlate of focus but main stress is (a.o. Féry & Samek-Lodovici 2004, Samek-Lodovici 2005, Büring 2008). Although pitch accents are not banned from the preverbal subject position in French, we argue that leftmost main stress has a marked status in French and is avoided whenever another structure is available in the language that satisfies the same syntactic, semantic and discursive requirements and at the same time enables satisfying Hi.

Before going through the details of our own analysis, we will briefly outline Samek-Lodovici's (henceforth SL) analysis of English and Italian focusing. Italian and English are both SVO head-initial languages and have in common that they are rightward oriented with respect to main stress: in the neutral case (all-focus sentences) the main prosodic prominence is aligned with the right-edge of the clause. This is illustrated in the subsequent examples, where capitals indicate the position of main stress.

- (22) A: What happened?  
B: A woman brought the FLOWERS.  
B': Una donna ha portato i FIORI.  
'A woman has brought the flowers.'

Within the OT approach proposed by SL, the link between prosodic prominence and focus has been implemented under the form of the STRESS-FOCUS constraint.

(23) STRESS-FOCUS (SF): A focused phrase has the highest prosodic prominence in its focus domain.

STRESS-FOCUS ensures that no candidate can emerge that assigns more prominence to a non-focused item than to a focused one.

In English and Italian, phonological constraints push the main stress towards the right-edge of the clause.

(24) HP: Align the right boundary of every P-phrase with its head(s).

(25) HI: Align the right boundary of every I-phrase with its head(s).

HP and HI, adapted from McCarthy & Prince (1993) and Truckenbrodt (1995, 1999) (see SL 2005 and references therein), require that prosodic heads (phrasal stress) be aligned with the right boundary of the corresponding phonological and intonation phrases (Selkirk's 1984 prosodic hierarchy: prosodic word < phonological phrase ( $\phi$ /P) < intonation phrase (I) < utterance phrase (U)), where phonological phrases correspond to lexical XPs (NPs, VP and APs) with the functional items on their recursive side, and intonation phrases to syntactic clauses.

What's crucial is that in the languages considered here, the subject position does not match the position where main stress is neutrally assigned. The fact that focused items must bear the highest prosodic prominence in their domain makes subject focusing in languages such as Italian and English an area of the grammar where the respective demands of prosody and syntax clash: on the one hand, prosody requires from the main stress of the clause to be aligned with its right-edge, and on the other hand, syntax requires that the preverbal subject position be filled. English and Italian both show their own strategy in order to solve this conflict. English favours syntax over prosody in keeping the canonical SVO order and shifting the main stress to the subject. This is illustrated in the following example.

- (26) A: Who bought a cake?  
 B: JOHN bought a cake.  
 B': JOHN did.

Italian adopts the reverse strategy in favouring prosody over syntax: main stress keeps its rightward position while the subject occupies a position located at the right-edge of the sentence, as illustrated in example (1) and repeated below for convenience.

- (27) A: Chi ha portato questi fiori?  
 'Who brought these flowers?'  
 B: Ha portato i fiori una DONNA.  
 has brought the flowers a woman

In other words, when the respective requirements of syntax and prosody clash, syntax gets the upper hand in English that is, the canonical SVO order is preserved, whereas in Italian prosody does and the canonical SVO order is simply discarded.

In his extensive study of different focusing paradigms, SL proposes that the following hierarchical rankings of constraints are responsible for the above facts:

- (28) English: SF >> EPP >> STAY >> HP >> HI  
 (29) Italian: SF >> HI >> HP >> EPP >> STAY

In both languages, SF is the highest-ranked constraint. In English, the hierarchical ranking of the syntactic constraints EPP and STAY above the prosodic constraints HP and HI allows for the emergence of a candidate such as (26B), in which the main prominence is not aligned with the right-edge of the clause. The reversed ranking of these constraints, in Italian, is responsible for the emergence of the candidate (27B), in which the subject position is empty.

### 3.1.2. French subject focusing

Let now finally turn to our French subject/non-subject asymmetry. French is similar to Italian and English in that it is a SVO language whose main stress is neutrally assigned to the right-edge of the clause. As illustrated below, in all-focus sentences, main stress falls on the rightmost item.

- (30) A: What happened?  
 B': Une femme a apporté des FLEURS.  
 a woman has brought some flowers  
 'A woman brought flowers.'

Our proposal is that the asymmetry described in section 2.1 follows from the subsequent hierarchical ranking of constraints (we leave the ranking of HP open for further research):

- (31) French: SF >> EPP,HI >> \*STR

As in English, Italian and NS, we take the French SVO canonical order to indicate that

EPP is ranked above STAY in this language. However, as was mentioned in section 2.1 and contrary to Zerbian’s syntactic assumptions about cleft-sentences in NS, the analysis adopted for French cleft-sentences does not involve a movement of the focused constituent. As a consequence, the constraint STAY is not crucial in order to account for the distribution of cleft-sentences in information focusing contexts. We propose that the preference for cleft-sentences over canonical sentences in subject focusing follows from the interplay of the four constraints SF, EPP, HI and \*STR.

The constraint SF outranks all the other constraints, as no candidate can emerge in French which assigns more prosodic prominence to a non-focused constituent than to a focused one. The crucial constraints here are the syntactic EPP constraint and the prosodic HI constraint. We have seen that the ranking of EPP above HI is responsible for the leftmost stress displayed in English subject focusing, whereas the ranking of HI above EPP is responsible for the empty subject position and the final subject configuration witnessed in Italian. These two languages favour one constraint over the other and are in this respect different from French, which resorts to a configuration, namely a cleft-sentence, that satisfies both EPP and HI, to the prejudice of \*STR.

The proposed ranking for French subject focusing is illustrated in the tableau 1 in (32). Candidate *a*, the winning candidate, is a cleft-sentence. From a syntactic perspective, this candidate contains more layers than candidates *b* to *d* and therefore fares worse on the constraint \*STR.

(32) Tableau 1: Subject focusing in French

	Context: Who is eating a cookie?	SF	EPP	HI	*STR
☞ a.	[ <sub>IP</sub> [ <sub>IP</sub> c’[ <sub>I</sub> est MONA]] [ <sub>CP</sub> qu [ <sub>IP</sub> -i mange un biscuit]]] [ <sub>U</sub> [ <sub>I</sub> { <sub>φ</sub> C’est MONA} } [ <sub>I</sub> { <sub>φ</sub> qui mange un biscuit}]]]				*
b.	[ <sub>IP</sub> MONA [ <sub>I</sub> mange un biscuit]] [ <sub>U</sub> [ <sub>I</sub> { <sub>φ</sub> MONA} } { <sub>φ</sub> mange un BISCUIT}]]]	* !			
c.	[ <sub>IP</sub> MONA [ <sub>I</sub> mange un biscuit]] [ <sub>U</sub> [ <sub>I</sub> { <sub>φ</sub> MONA} } { <sub>φ</sub> mange un biscuit}]]]			* !	
d.	[ <sub>IP</sub> [ <sub>I</sub> mange un biscuit MONA]] [ <sub>U</sub> [ <sub>I</sub> { <sub>φ</sub> mange un biscuit} } { <sub>φ</sub> MONA}]]]		* !		

Candidate *a*, as candidates *c* and *d*, however satisfies SF, as the most prominent item within a cleft-sentence is notoriously the clefted constituent.

From a prosodic perspective, we have represented the cleft-sentence as split into two intonation phrases, one encompassing the identificational TP and the other the relative-like clause. In other words, in the type of cleft-sentences investigated in this work, each clause is wrapped within a separate intonation phrase. In the prosodic structure offered in tableau 3, the focused item, which is here the head of the intonation phrase, is aligned with the right-edge of this prosodic constituent, thus satisfying HI. The phono-

logical structure proposed here is easily derivable from the syntactic structure proposed by CR&R by applying standard syntax-phonology mapping rules (Nespor & Vogel 1986). This structure is supported by their acoustic data and consistent with their observations. The former authors give the following ‘classical’ pattern of the type of cleft-sentences considered in this section that is, declarative subject-narrow-focus cleft-sentences:

- (33) [C'est Jean-Pierre] [qui est sorti]  
           |      |                  |      |  
           H     L%                  L     L%
- ‘It’s J.-P. who’s gone out.’

The tones are only noted on the secondary (*Jean* and *est*) and the main (*Pierre* and *sorti*) stressed positions. The relative clause is characterized by a flat intonation. They observe that a terminal low boundary tone (L%) is present once at the end of the focused phrase and again at the end of the relative-like clause. They further note that this “duplication of what is otherwise identified as typical ‘terminal intonation’ may also involve other features typical of the end of utterances, such as final lengthening”. We take this as evidence for the presence of two separate intonation phrases.

The fact that French is not a null subject language also seems to point towards the relatively high ranking of EPP. As mentioned above, EPP is only violated when the subject position is not overtly filled. This is not the case in the matrix clause of cleft-sentences in French, as the demonstrative pronoun *c’*, be it expletive or not, occupies this position. EPP is also satisfied in the relative clause, as the Comp *qui* simultaneously heads CP and fills the subject position. In tableau 1, only candidate *d*, the counterpart of the Italian verb-subject inversion, violates EPP, which constitutes a fatal violation and leads to the elimination of this candidate. The cleft-sentence alone does not allow determining whether HI dominates EPP in French or whether it is EPP that dominates HI, as this construction enables satisfying both constraints. For the time being, we propose that neither constraint dominates the other in French. As for Italian and English, we propose that the ranking of \*STR above EPP and HI prevents the cleft-sentence candidate from emerging in (non-contrastive) subject focusing contexts in these languages.

The proposed ranking of constraints also enables to account for the non-emergence of cleft-sentences in object and adjunct focusing. Objects and adjuncts are distinct from subjects in that their canonical position is closer to the right-edge of the clause. As shown in the following tableau, \*STR prevents the cleft-sentence from emerging when the canonical sentence satisfies SF and HI.

(34) Tableau 2: object focusing in French

		Context: What is Mona eating?	SF	EPP	HI	*STR
☞	a.	[ <sub>IP</sub> Mona [ <sub>I</sub> mange un biscuit]] [ <sub>I</sub> { <sub>φ</sub> Mona } { <sub>φ</sub> mange un BISCUIT }]				
	b.	[ <sub>IP</sub> [ <sub>IP</sub> c' [ <sub>I</sub> est un biscuit] [ <sub>CP</sub> que [ <sub>IP</sub> Mona mange]]] [ <sub>I</sub> { <sub>φ</sub> C'est un BISCUIT }] [ <sub>I</sub> { <sub>φ</sub> que Mona mange }]				* !

What about the ranking of STAY? In his study, SL uses object focusing in bi-transitive constructions in order to determine whether STAY dominates HI or whether HI dominates STAY. In French bi-transitive constructions, the canonical order is S-V-DO-IO. However, French also resorts to heavy NP-shift when necessary, therefore the ordering of the object with respect to the indirect object can be flexible in French. In our investigation of the preferred strategy in order to put narrow focus on the object in a context such as the one provided below in (35A), we could obtain no categorical judgment from the French speakers investigated. Based on the following type of “marginally acceptable” (35B), in which the direct object is stranded in clause final position, SL concludes that French is similar to Italian in ranking HI above STAY.

- (35) A: Qu' est-ce qu' tu vends à Mona?  
 what is-it that you sell to Mona  
 ‘What are you selling to Mona?’  
 B: Je vends à Mona un LIVRE.  
 ‘I’m selling to Mona a book.’  
 C: Je vends un LIVRE à Mona.  
 ‘I’m selling a book to Mona.’

French shares with NS the possibility of leaving wh-phrases in-situ in wh-questions. Therefore, (36) below constitutes a perfectly well-formed alternative to (35A).

- (36) Tu vends quoi à Mona?  
 You sell what to Mona  
 ‘What are you selling to Mona?’

(36) however does not allow to conclude that French is similar to English in that the main stress can simply shift from the indirect object to the in-situ direct object, as (36) is preferably interpreted as involving a multiple focus: one on the wh-phrase and the other on the indirect object. It is worth noting that the interrogative counterpart to (35B) is undoubtedly ungrammatical.

- (37) \* Tu vends à Mona quoi?  
 you sell to Mona what  
 ‘What are you selling to Mona?’

For the time being, and as it is not crucial in the account of the subject/non-subject asymmetry in the distribution of cleft-sentences, we leave the issue of STAY’s ranking open for further research.

### 3.1.3. Summary and discussion

In sum, we have proposed that cleft-sentences satisfy SF, EPP and HI in that they simultaneously assign the highest prominence to the focused item, they permit to align this main stress with the right-edge of an intonation phrase and their two subject positions are overtly filled. They fare worse than canonical sentences on \*STR, but this violation is only fatal in non-subject focusing due to the low ranking of this constraint in the language. Cleft-sentences have long been associated with the notion of extraction of the focused item and as a consequence with movement. We have departed from this view in claiming that the constraint STAY is not crucial in an account of the competition between canonical sentences and clefts. How to prevent cleft-sentences from emerging in English and Italian subject focusing? The ranking of \*STR is crucial here: we propose that this constraint is ranked above HI and EPP in these languages.

Our account captures Jespersen's (1937) view that cleft-sentences can be considered one of the ways "by which the disadvantages of having a comparatively rigid grammatical word-order (SVO) can be obviated" and Lambrecht's (2001:488) principle 1, stating that "the occurrence of cleft constructions in a language correlates with the degree of positional freedom of prosodic accents and syntactic constituents in that language". In addition to that, we hope to have shown that the prosodic prominence of the clefted constituent directly follows from the grammar and is perfectly consistent with the phonology of the language. From a theoretical perspective, our account crucially reduces the number of constraints used in order to account for the phenomenon under investigation, as we have postulated no extra (interface) constraint. Does our account extend to NS? One of Zerbian's (2005, 2006) main claims is that there is no prosodic expression of focus in Northern Sotho and that this language more generally lacks grammatical focus marking. From a prosodic perspective, Northern Sotho is distinct from French, English and Italian, as it is a tone language. However, as shown by Zerbian (2006, Chapter 3), it also has accentual properties of the type observed in the above cited European languages and several phonetic cues speak in favour of rightmost prominence in this language. Zerbian (2005) admits that "phono-syntactic processes like deletion, morphosyntactic operations like pronominalization, and syntactic movement like dislocation and inversion conspire in order to place the focused constituent in clause-final position". In our view, these facts added to the striking resemblance with French speak in favour of a reconsideration of the null-hypothesis, that is, that Northern Sotho has some means of grammatical (prosodic?) focus marking.

### 3.2. French contrastive cleft-sentences

#### 3.2.1. Non-corrective contrastive cleft-sentences

In section 3.1, we have provided an account to the preference for cleft-sentences over canonical sentences in the type of information focusing context set by a *wh*-question. We have concluded that this preference follows from the ranking in (31). The proposed ranking predicts that adjunct and object cleft-sentences do not surface as optimal candidates in information focusing contexts, but we now have to account for the fact that they do surface, along with subject cleft-sentences, in contrastive contexts. This is the case in the following examples:

- (38) A: ‘Why do you suspect me?’  
B: C'est vos EMPREINTES qu' on a trouvées sur le coffre.  
It-is your fingerprints that we have found on the safe  
‘It is your fingerprints that they found on the safe.’
- (39) A: Things have changed at the Miller family (Adapted from Umbach 2004)  
B: (Ce soir) c'est RONALD qui est allé faire les courses  
This evening it-is Ronald that is gone do the grocery

The above cleft-sentences are so-called « informative-presupposition it-clefts » in Prince's (1978) terminology. They are characterized by (i) the exhaustive identification (contrastiveness) of the clefted constituent, (ii) by the non-given status of the (presupposed) relative-clause and (iii) the obligatory presence of a prosodic accent on the relative clause (Lambrecht 2001: 483). In Umbach's (2004:164) terminology, the above examples are cases “which come close to a correction, although the proposition to be corrected is not expressed explicitly”. What is noticeable is that the informative status of the relative clause does not prevent main stress from being assigned to the clefted constituent. This is reminiscent of so-called Superman-sentences in example (42) (Neeleman & Szendrői 2004, F&SL 2006). Superman sentences are cases of nested foci. They are among the sentences displaying the configuration in (40), where “SF requires both foci to bear the highest prosodic prominence and can be satisfied by assigning local prominence to the innermost focus”.

- (40) [ ... [XP]<sub>f</sub> ... YP]<sub>f</sub>

This configuration is illustrated in the following example:

- (41) Father: What happened?  
Mother: You know how I think our children should read decent books.  
Well, when I came home, rather than doing his homework, Johnny was reading SUPERMAN to some kid.
- (42) [Johnny [was reading SUPERMAN<sub>f3</sub> to some kid]<sub>f2</sub>]<sub>f1</sub>

The above example contains three foci: the entire sentence (f1) is a new information fo-

cus, as it is part of the answer to the father's question, *reading superman to some kid* (f2) is contrastively focused against *doing his homework* and finally, *Superman* (f3) is contrastively focused against *decent books*, « and appears to take the entire VP as its focus domain. As mentioned in (23), SF requires that a focused constituent be most prominent in its focus domain. F&SL adopt Truckenbrodt's (1995) definition of focus domain, which makes SF sensitive to the extension of the focus domain: “the focus domain always contains the focused phrase and identifies the background information relevant to the semantic denotation of focus; it is thus defined in semantic terms and does not necessarily coincide with a single prosodic constituent”.

In the cleft-sentences in section 2, the focus was constituted of one constituent (for instance *Thomas* in example (2B)) and the focus domain of the entire sentence. However, as the relative clause was given, and typically deaccented (and easily omitted), we could have easily accounted for the non-rightmost stress at the Utterance level by resorting to the constraint DESTRESSGIVEN (F&SL and references therein).

(43) DESTRESSGIVEN: A given phrase is prosodically non-prominent.

The Superman sentence in (42) and the examples in (38) and (39) have in common that the non-rightmost stress cannot be explained through the given status of the items separating the main stress from the right-edge of the sentence. F&SL propose that the ranking of SF above HI correctly predicts the non-rightmost stress in example (42). Placing main stress on *Superman* is the only way to simultaneously satisfy SF with respect to f1, f2 and f3. The rightmost position of main stress that would follow from the ranking of HI above SF would satisfy SF with respect to f1 and f2, but would fail SF with respect to f3. The ranking of SF above HI is not sufficient in order to account for the clefting strategy adopted in French in such cases of contrastive foci. The requirement that main stress be aligned with the right-edge of an intonation phrase appears stronger in French. HI is satisfied in the examples (38) and (39), as the right boundary of each I-phrase is aligned with its head. We propose that these data can be accounted for by the ranking of SF above HEAD-U (Samek-Lodovici 2005).

(44) HEAD-U (HU): Align the right-boundary of every utterance phrase with its head. Example (42) only involves a single intonation phrase and as a consequence the head of this phrase is also the head of the utterance phrase (U). This is not the case in the above cleft-sentences, which involve two separate intonation phrases and require that the utterance level be considered separately.

We propose that the pattern observed in contrastive cleft-sentences follows from the following constraint ranking: SF<sub>Constrast</sub> >> SF<sub>New</sub> >> HI(, EPP) >> HU >> \*STR

For more accuracy, we distinguish between SF<sub>Constrast</sub> (SF<sub>C</sub>) and SF<sub>New</sub> (SF<sub>N</sub>) (F&SL). In-

well as HU), because the right boundary of the intonation phrase (as well as the utterance phrase) is misaligned relative to the head on *vos empreintes*. Finally, candidate *e* is an equivalent to the English example in (42), only it involves two foci instead of three. In French, this candidate is the optimal candidate under a discourse-given reading of *sur le coffre*. However, under the investigated reading, this candidate fatally violates HI and HU.

In sum, the cleft-sentences from (38) and (39) exhibit a contrastively focused item in clefted position and a discourse-novel relative clause which (i) cannot be omitted and (ii) is accented although it does not receive main stress. Another way to look at these so-called cases of “informative-presupposition” cleft-sentences is, as we have proposed, that they constitute cases of nested foci reminiscent of so-called *Superman* sentences, as the pattern [C'est [XP]<sub>f</sub> qui YP]<sub>f</sub> is similar to the configuration in (40). We have maintained that in French, the conflict observed in English between SF and HI is transposed into a SF and HU conflict.

### 3.2.2. Corrective contrastive cleft-sentences

Finally, we would like to turn to corrective contrastive cleft-sentences. In Umbach's (2004) terminology, the following examples are cases of “exclusion by substitution”: the clefted constituent aims at correcting a previously mistaken belief.

- (46) A: ‘Mona is eating a plum.’  
 B: Enfin, c'est Daniel qui mange une prune.  
 ‘Well, it's Daniel who is eating a plum.’
- (47) A: ‘He is eating a plum.’  
 B: Non, c'est un biscuit qu' il mange.  
 ‘No, it's a cookie that he is eating.’
- (48) A: ‘He is talking to Mary.’  
 B: Enfin, c'est à Mona qu' il parle.  
 ‘Well, it's to Mona that he is talking.’
- (49) A: ‘He is going home.’  
 B: Non, c'est à l' école qu' il va.  
 ‘No, it's to school that he is going.’

What is noticeable is that although the relative clause is discourse-given, speakers have the strong intuition that it generally needs to be produced in corrective contrastive contexts. In our view, this is not surprising considering that corrective contexts are distinct from wh-questions contexts in that no gap is waiting for an item/value to fill it. The expression of the relative clause is necessary in order to understand which value is corrected / replaced, in other words which gap is filled. There seems to be a requirement on the spelling-out of the predicate that holds for the (correct) focused item. The overall

sentence itself unexpectedly replaces an all-focus sentence expressing a mistaken belief. Although this needs more investigation, we would like to propose that in corrective contrastive contexts the overall cleft-sentence is a case of free second occurrence focus (Büring 2008) embedding a contrastive focus in the clefted position. If this is correct, the analysis proposed above for informative-presupposition cleft-sentences would extend to this type of cleft-sentences as well.

#### 4. Conclusion

The data from both Northern Sotho (Zerbian 2006) and French suggest that the distribution of cleft-sentences does not only follow from the exhaustivity of the focused item. We have claimed that in French constituent questions contexts, subject clefts aim at satisfying STRESS-FOCUS in a way that satisfies both HI and EPP: a constituent which is otherwise leftmost (preverbal) occurs in a position which is aligned with the right-edge of an intonation phrase and the preverbal subject position is overtly filled by a pronoun. We have proposed to view non-subject clefts (as well as subject clefts) in [-corrective] contrastive contexts (so-called “informative-presupposition” cleft-sentences) as cases of nested foci reminiscent of so-called *Superman* sentences and we have provided an analysis in the same line as the one offered by Féry & Samek-Lodovici (2006) except that the SF/HI conflict witnessed in English is transposed in French into a SF/HU conflict. Finally, we have proposed to extend this analysis to [+corrective] contrastive cleft-sentences and suggested that in corrective contexts, the entire cleft-sentence constitutes an instance of free second occurrence focus.

Acknowledgment: I would like to thank Marc Brunelle, Marie-Hélène Côté and Léa Nash for their helpful comments and suggestions on a previous version of this work. I am also grateful to Vieri Samek-Lodovici, Georges Rebuschi and Laurent Roussarie for discussion, suggestions, and help.

---

<sup>1</sup>Some French speakers seem to accept in-situ subject focusing (J.M. Marandin, *p.c.*). Do they have a different French grammar than the one accounted for here, or is it that what seems to be in-situ focusing is in fact right dislocation of the elements following the subject? We leave this open for future research.

<sup>2</sup>« Quand les cigares » in *Tout est calme*, 2006, U10

<sup>3</sup>« Les contes du grime » in *Libération*, 09/27/2008.

<sup>4</sup>I would like to thank Prof. Manfred Krifka for drawing my attention to this fact.

<sup>5</sup>It is worth noting that questioning a subject by means of a cleft-sentence is not as common in

---

French as in NS. Cleft subject wh-questions are grammatical and productive, however they are highly stigmatized by prescriptive grammars and as a consequence children are often corrected when they produce such sentences.

# Topic-focus and focus-topic: the first and foremost motivation of Ancient Greek word order

Giuseppe G. A. Celano

Università Cattolica di Milano  
Istituto di Filologia Classica e Papirologia  
Largo Gemelli 1  
20123, Milano (ITALY)  
giuseppe.celano@unicatt.it

## Abstract

D. Matic' (2003) has suggested that Ancient Greek (AG) word order is motivated by pragmatic construal: argument-focus and predicate-focus sentences are determined by two different word order patterns. Contrary to this, I aim to show that AG word order is completely indifferent to such a syntax-based classification of pragmatic construal, being by no means affected by whether focus is represented by a VP or an NP, or whether topic is an NP or a VP. I argue that all AG sentences show a topic-focus dichotomy at any syntactic level, and that such a dichotomy can have two configurations: there exists a functional contrast between topic-focus and focus-topic order, which is iconically motivated by the prominence given by the speaker to either topic or focus.

**Keywords:** Ancient Greek, word order, topic-focus, focus-topic.

## 1. Introduction

In the most recent study on the topic,<sup>1</sup> Matic' (2003) argues that Ancient Greek (AG) word order can be accounted for by the distinction between argument-focus and predicate-focus construal. Look at models (1) and (2):

Matic's Major Model<sup>2</sup>:

- (1) AG sentences with narrow focus:

ECTop – FSTop<sub>1-n</sub> – Narrow Focus – Verb – ConTop<sub>1-n</sub> – Presupposed Material

- (2) AG sentences with broad focus:

FSTop<sub>1-n</sub> – Verb – ConTop<sub>1-n</sub> – Focal Material (Verb + Focal Material = Broad Focus)

In its simplest form, when AG sentences receive argument-focus construal, the word order would be Main Topic-Narrow Focus-Presupposed Verb-Presupposed Material; on

---

<sup>1</sup> H. Dik (2007) has recently repropounded her theory that every AG word order can fit the scheme Topic-Focus-Verb-Remainder (Dik 2005). However, I fully agree with Matic's criticism of this model, and hence, in my analysis, I start with his article.

<sup>2</sup> The minor model accounts only for about 9 % of AG sentences (Matic' 2003: 615). I refer the reader to Celano (forthcoming) for a full analysis of Matic's models.

the contrary, when predicate-focus construal is to be triggered, word order would be different, i.e., Main Topic-Focal Verb-Focal Constituents. (In both models, the main topic may also be placed immediately after the verb, but this, as well as the difference between ECTops, FSTops, and ConTops, is not relevant here.) The models are illustrated in (3) and (4):

- (3) TOP[Ho dè<sup>3</sup> dè: Kûros] FOC[epì taúte:s tê:s gunaikòs tòn paída]  
 the PTC PTC Cyrus against this the woman the son  
 PRES[estrateúeto].  
 marched  
 ‘Cyrus then marched against the son of this woman.’ (Hdt. 1.188.1 = Dik 1995: 54)
- (4) (The other Thracians have the following custom:)  
 FOC[Po:léousi tà tékna ep’ eksago:gê:].  
 sell.3PL the children for export  
 ‘They sell the children for export.’ (Hdt. 5.6.1 = Matic’ 2003: 582)

According to Matic’, example (3) shows one preverbal focal constituent (*epì taúte:s tê:s gunaikòs tòn paída*) because it is an argument-focus sentence (hence, the verb is presupposed). On the other hand, example (4) has two postverbal focal constituents (*tà tékna* and *ep’ eksago:gê:*) because the verb, too, is focal, the sentence receiving predicate-focus construal. In Celano (forthcoming), however, it is extensively argued that such an account needs revision. The models identified by Matic’ are better understandable with reference to the position of the main sentence accent. The slots *Narrow Focus* in model (1) and *Focal Material* in model (2) should be simply regarded as the place of the main sentence accent. This can fall on either side of the verb and, according to Lambrecht’s (1998) principle of accent projection, determine argument-focus or predicate-focus construal only on the basis of context. See example (5):

- (5) Tò mè: kalò:s légein ou mónon eis AUTÒ<sup>4</sup> toúto ple:mmelés,  
 the PTC well to.say not only to itself this improper  
 allà kai FOC[KAKÓN ti empoieî taïs PSUCHAÎS].  
 but also bad something does the souls  
 ‘To say something not good is not only improper in ITSELF, but is also BAD for the SOULS.’ (Pl. *Phd.* 115e)

Here *empoieî* is focal but, contrary to Matic’’s model (2), it follows and does not precede the focus *kakón* (note that *psuchaîs* may also be topical). Likewise, consider example (6):

- (6) A: Hoíon tí légeis, ô: Só:krates?  
 for.example what say.2SG oh Socrates  
 ‘For example, what do you say, Socrates?’

<sup>3</sup> Note that this paper is confined to lexical words; appositives appearing within square brackets are not to be regarded as belonging to the constituent.

<sup>4</sup> Small capitals are used to indicate where the main sentence accent is most likely to fall.

B: Hoïon kaì He:síodos peri hamákse:s PRES[légei] FOC[“tò  
 for.example also Hesiod about cart says the  
 hekatòn dé te DOÚRATH’ hamákse:s”].  
 hundred PTC and pieces.of.wood of.cart  
 ‘For example, about a cart Hesiod too says “a hundred pieces of WOOD in a  
 cart”.’ (Pl. *Tht.* 207a)

Here the verb *légei* is presupposed via the preceding question, but again, contrary to model (1), it does not follow the focal constituent but precedes it. Another important reason for revising Matic’s model is the fact that model (1) is amply attested but, in most cases, the verb’s presupposition is possible only if pragmatic accommodation is postulated, which is tantamount to just making pragmatic accommodation vacuous. Then, contrary to the case of Hungarian, from which Matic takes inspiration, model (1) does not generally receive an exhaustive interpretation, as the translation of example (3) shows, for the sentence cannot be rendered as ‘then, it is against the son of this woman that Cyrus marched’. These reasons, among others, have led me to propose the provisional model in (7-9),<sup>5</sup> which essentially coincides with Weil’s (1879) account:<sup>6</sup>

- (7) Setting Topic<sub>1-n</sub> – (Topic)<sup>7</sup> – Accented Focal Constituent<sub>1-n</sub> – Verb – (Topic) – Unaccented Constituent<sub>1-n</sub>
- (8) Setting Topic<sub>1-n</sub> – (Topic) – Unaccented Constituent<sub>1-n</sub> – Verb – (Topic) – Accented Focal Constituent<sub>1-n</sub>
- (9) Accented Focal Constituent<sub>1-n(?)</sub> – Verb – (Topic) – Accented Focal Constituent<sub>1-n(?)</sub>

To put it simply, I agree that the main topic (Topic) may be in first position or immediately after the verb, but where Matic hypothesizes the position of focus, I suggest the position of the main sentence accent, which hence may be on the right or the left of the verb without any regard to the pragmatic status of the verb itself. In other words, the verb may be presupposed or, more often, focal, but this information is not conveyed by word order but only by context.

<sup>5</sup> According to Lambrecht’s theory (1994), unaccented constituents are topics when they are lexical words. By contrast, focal verbs and adjectives do not usually bear any accent. Thus, in my scheme, *Unaccented Constituent* can refer to either a topic or a focus.

<sup>6</sup> Weil’s (1879) is the first modern account on AG word order (which then influenced Kühner-Blass-Gerth 1890–1904: 592–594 and Loepfe 1940: 42). It is impressive how clearly he writes about not only AG word order but also what we now call *information structure*. In a strictly scientific perspective, however, it is difficult to derive benefit from Weil’s study, because he approaches the issue not as one who is trying to prove a theory, but as a near-native speaker of AG who is describing his own language (he even adduces self-composed AG examples) without formalization. Nonetheless, it is clear from his examples that the two types of accentuation he proposes for AG (*accentuation ascendante* and *accentuation descendante*) essentially agree with my model.

<sup>7</sup> The parentheses indicate that the main topic can be on the right or the left of the verb. “1-n” means that more than one constituent can be found in that position.

## 2. The topic-focus and focus-topic contrast

The models in (7-9) raise the crucial question of their respective difference, which I set out to explain here. See examples (10) and (11) below:

(10) ALE:THÊ: légeis.  
truth say.2SG  
'You are right.' (Pl. *Tht.* 190b)

(11) Légeis ALE:THÊ:.  
say.2SG truth  
'You are right.' (Pl. *Tht.* 169e)

The context and the meaning of examples (10) and (11) are exactly the same. There are two interlocutors. The former claims something, and the latter replies *ALE:THÊ: légeis* or *légeis ALE:THÊ:* that is, literally, 'you tell the truth'. I explain this difference in word order by postulating the existence of a binary contrast between two configurations: focus-topic and topic-focus. *ALE:THÊ: légeis* shows the configuration focus-topic (*ale:thê: = focus, légeis = topic*), while *légeis ALE:THÊ:* shows the configuration topic-focus (*légeis = topic, ale:thê: = focus*).<sup>8</sup> The difference in meaning is strictly iconic. When the sentence starts with the focus, the focus is given precedence over the topic, and hence – if, in very general terms, we define focus as 'the sentence's purpose' – the configuration focus-topic is meant to meet the speaker's wish to let the hearer *immediately* know 'the point of his sentence' (i.e., the focus). On the contrary, if the sentence starts with the topic, as in (11), the sentence is thought of as connected to what precedes: in this case, the sentence's connection with the discourse has precedence over the *immediate* expression of the focus. Note that when focus precedes topic, as in example (10), the sentence does not necessarily receive a contrastive reading, as occurs in English and Italian. Consider example (12):

(12) a. THE TRUTH you told.  
b. LA VERITÀ hai detto.

The sentences in (12) can only have a contrastive interpretation in English and Italian, but this does not hold true for AG for two key reasons. First, preverbal focal constituents are very common in AG, and no translator has ever perceived any contrastiveness in such word order (although it may be present in the right context). Secondly, Old Italian and Modern Italian poetry, which are genetically related to AG, attest to the possibility of such an interpretation, in that they allow for the same word order phenomena as AG (preverbal and postverbal accented focal constituents) without generally any difference in contrastiveness (Celano, forthcoming).

The difference between the topic-focus and focus-topic configuration is also well illustrated in the following pair of questions:

---

<sup>8</sup> Note the position of the main sentence accent that is supposed to be always on *ale:thê:*. Such a supposition is also supported by the fact that Modern Greek, as well as a number of Indo-European languages, usually place focal accents on nouns, not verbs or adjectives (although this is possible).

(13) FOC[Tí] oûn TOP[ê:n toûto]?  
 what PTC was that  
 ‘What was that?’ (Pl. *Phd.* 58a5)

(14) TOP[Toûto] dè dè: FOC[tí esti]?  
 that PTC PTC what is  
 ‘That, what is it?’ (Pl. *Phd.* 58a9)

The questions in (13) and (14) are essentially the same (any difference in the tense or particles is irrelevant here). In this pair, the same principle suggested above is operative. In (13) there is the usual word order for questions: the interrogative pronoun, which is the focus, is in first position, followed by the rest of the sentence, i.e., the topic. This focus-topic configuration is typical for questions because questions are just posed to know something, and hence are naturally focus-oriented. However, it is also possible to express a question in a topic-focus configuration, as shown in (14). In this case, the question is tied to the preceding discourse: the questioner starts with the pronoun *toûto*, whose referent is known to the interlocutor, and goes on with the focus *what is*. While questions and answers are typically formed with the focus-topic configuration, declaratives within narrations generally show just the opposite configuration (i.e., topic-focus). Within narrations, the author tends to connect sentences to create a coherent discourse, as in (15):

(15) TOP[Árti] gàr FOC[TOP[enthénde] FOC[OÍKADE oíchetai]], TOP[oikeî]  
 just PTC from.here home has.gone lives  
 dè FOC[EGGÛS] FOC[en MELÍte:].  
 PTC close in Melite  
 ‘He has just gone HOME from here, and he lives CLOSE by in MELITE.’ (Pl. *Prm.* 126c) (transl. H. N. Fowler: 1914)

Here the former clause starts with the temporal adverb *árti*, which ties the sentence to the preceding discourse; the latter clause starts with the verb *oikeî*, which is clearly presupposed via the preceding *oíkade*. In both cases, the configuration is topic-focus. However, nothing prevents the author from using a focus-topic configuration also in the middle of a narration, as in (16):

(16) FOC[Polù mentàn HÔ:DE mállon], ho:s légo:, TOP[agastheíe:n] [...]  
 much PTC.PTC thus more as say.1SG would.wonder.1SG  
 ‘As I say, I would be much more amazed by THIS [...]’ (Pl. *Prm.* 129e)

Here the verb *agastheíe:n* is clearly presupposed via context because it has been mentioned a little before in the *Parmenides* (*agaíme:n àn égo:g’, éphe:, thaumastô:s*); nonetheless, the author starts the sentence with the focus, since he is interested here in giving it prominence. Another example which illustrates the point very well is the following:

(17) A: TOP[Étuchon] dé, ô: Phaído:n, FOC[tínes paragenómenoi]?  
 happened PTC oh Phaidon who being.there

‘Who was there?’

B: FOC[HOÛTÓS te dè: ho Apollódo:ros tô:n epicho:rió:n]  
this and PTC the Apollodorus the native.Athenians  
TOP[parê:n]FOC[kai KRITÓBOULOS kai ho PATÈ:R autoû  
there.was and Critobulus and the father his  
kai éti HERMOGÉNE:S kai EPIGÉNE:S kai AISCHÍNE:S  
and moreover Hermogenes and Epigenes and Aeschines  
kai ANTISTHÉNE:S]; TOP[ê:n] dè FOC[kai KTÉ:SIPPOS  
and Antisthenes; there.was PTC and Ctesippus  
ho PAIANIEÛS kai MENÉKSE: NOS kai álloi tinès  
the Paeonian and Menexenus and others some  
tô:n EPICHO:RÍO:N].  
of.the native

‘There was THIS Apollodorus, a native Athenian, and CRITOBULUS and his FATHER and HERMOGENES and EPIGENES and AESCHINES and ANTISTHENES; Ctesippus the PAEANIAN and MENEXENUS were there too, and some other native ATHENIANS.’ (Pl. *Phd.* 59b)

Example (17) shows clearly how the binary contrast topic-focus and focus-topic works. The question has the topic-focus configuration: it is not an abrupt question, but it is tied to the preceding discourse. The word order of the question is even more instructive. As expected, it starts with the focus *houtós te dè: Apollódo:ros tôn epicho:rió:n* followed by the topic *parê:n*, which is in turn followed by the remaining part of the focus. The following clause, on the contrary, starts with the topic *ên* followed by *kai Kté:sippos* and the rest of the focus. The two clauses are the same in terms of meaning: *parê:n* and *ên* are synonymous, and the fact that the proper names change is not relevant for our purposes. Pragmatic context is apparently the same as well: both clauses answer the question and seem to receive sentence-focus construal.<sup>9</sup> However, the word order is exactly the opposite: the former clause shows the focus-topic configuration, while the latter shows the topic-focus configuration. The explanation for such a difference is the same as above: the former clause starts with the focus because it meets the questioner’s need to know who was with Socrates, thus causing the focus to take precedence over the topic. The latter clause, on the contrary, is thought of as being connected to the preceding one; it is certainly an answer to the question like the former clause, but coming second, it is its *connection* with the discourse that the author wishes to show, and therefore the configuration is topic-focus. Incidentally, note that example (17) supports the description of AG word order that I gave at the outset: that is, although both clauses seem to receive sentence-focus construal, they show the opposite word order. This is in accordance with the proposal above that pragmatic construal is not determined by word order, because the same pragmatic construal can be regularly expressed by different (even opposite) word orders.

<sup>9</sup> This claim presupposes Lambrecht’s information structure theory. But in truth (see also below) sentence-focus as well as argument-focus structures turn out to be analyzable as a sort of predicate-focus (i.e., topic-comment) sentences: for in all the structures, the topic-focus or focus-topic dichotomy is always detectable, regardless of which constituent the focus is (i.e., the predicate or one of its arguments or adjuncts).

### 3. What is topic and focus?

Thus far I have tried to show the binary contrast of topic-focus and focus-topic, all the while taking for granted the definitions of topic and focus. From my analysis of AG word order, topic and focus turn out to be definable as (the main) semantic categories for the structuring of word order. They represent the way in which AG speakers process linguistic data: AG sentences are formed via consecutive merger operations that combine words together *binarily* according to the *iconic contrast* shown so far (i.e., topic-focus and focus-topic) to form consecutive larger constituents, which I shall call ‘pragmatic constituents’.<sup>10</sup> See examples (18) and (19) below:

- (18) TOP[TOP[Prós] te FOC[TOP[toùs] FOC[Thessaloùs]]] FOC[TOP[élege]  
           to and the Thessalians said  
       FOC[TÁDE]].  
           this  
       ‘He told Thessalians THIS.’ (Hdt. 9.89.12 = Matic 2003: 616)

- (19) TOP[Kléarchos] dè FOC[FOC[TÁDE] TOP[eîpen]].  
       Clearchus PTC this said  
       ‘Clearchus said THIS.’ (X. An. 2.1.4 = Matic 2003: 616)

In example (18), there are two major constituents that are *prós toùs Thessaloùs* and *élege táde*: the former is the topic, and the latter is the focus (as context suggests); hence, the sentence has the configuration topic-focus. This means that the topic has precedence over the focus, because the author wants the sentence to be thought of as connected to the preceding discourse. But this is not all. Within these two major pragmatic constituents, we can identify further constituents. Within *prós toùs Thessaloùs*, there are *prós* and *toùs Thessaloùs*, the former being topical and the latter focal. Likewise, within *élege táde*, we can distinguish the topic *élege* and the focus *táde*. I suggest that all these constituents too are arranged in their order *according to the iconic contrast topic-focus and focus-topic*. This also holds true for the structure of example (19), where we can see two constituents, the latter of which presents the binary opposition between topic and focus in the configuration focus-topic. If we compare (18) and (19), we can see that they both present the same major configuration topic-focus. The difference, however, is *within* the major focus constituents:<sup>11</sup> in *élege TÁDE*, the configuration is topic-focus but, in *TÁDE eîpen*, it is focus-topic. Therefore, in the constituent *élege TÁDE* (i.e., topic-focus), the topic has precedence over the focus but, in *TÁDE eîpen*, the focus has precedence over the topic. Within the major constituents, the contrast between the configurations topic-focus and focus-topic is in a way less noticeable than it is when concerning the order of the major constituents; however, such a contrast must have been detectable by AG speakers, and this is just *what I suggest determines the difference in AG word order*. For English speakers and most speakers of modern languages, it is

<sup>10</sup> This term is introduced because, as will be seen below, the topic-focus and focus-topic contrast pinpoint constituents which do not always correspond to the *canonical* syntactic ones (e.g., the subject cannot always be separated by the VP).

<sup>11</sup> Note that the word order within the major topic constituent in (18) is blocked by syntax: for articles can only precede nouns. (But rarely can prepositions follow nouns in anastrophe.)

difficult to capture the difference between examples (18) and (19) because, in most modern languages, the binary contrast topic-focus and focus-topic *openly* operates almost exclusively at the level of the major constituents. Consider (20) and (21):

(Where did you go yesterday?)  
 (20) TOP[Yesterday] FOC[I went to the BEACH].

(21) FOC[I went to the BEACH] TOP[yesterday].

In examples (20) and (21), I suggest that the same principle shown for AG word order operates in English. The difference between the sentences is that (20) shows the topic-focus configuration, the sentence being connected to the preceding discourse via the topic in first position. On the other hand, the focus in (21) has precedence over the topic, the author being interested in immediately stating ‘the point of his sentence’. Of course, also in English the principle of topic-focus and focus-topic contrast is likely to be operative *within* these constituents, just as happens in AG. The only difference between AG and English is that AG can *more often* show it through word order changes, while in English the contrast is often *blocked* by syntax, because word order is usually fixed, with the exception of, generally, the major constituents. For this reason, in English we cannot translate example (19) as ‘Clearchus THIS said’ but only as ‘Clearchus said THIS’. In cases such as this, English syntax does not allow one to convey within the major focus constituent ‘the shade of meaning’ that the contrast between topic-focus and focus-topic can express in AG examples (18) and (19). However, I suggest that this same opposition operating in (18) and (19) can be found in English examples like (22) and (23):

(22) TOP[This] FOC[TOP[was] FOC[FOC[FORMALLY] TOP[said]]].

(23) TOP[This] FOC[TOP[was] FOC[TOP[said] FOC[FORMALLY]]].

The difference in adverb position can be explained by configurational contrast: in (22) the constituent *FORMALLY said* shows the focus-topic configuration, while in (23) *said FORMALLY* shows the topic-focus configuration. Note that I have introduced the term ‘pragmatic constituent’ because the constituents with which we are dealing seriously challenge the concept of syntactic constituent (as generally conceived by traditional grammar). Consider examples (24) and (25):

(For about midway of this day's march there was a deep trench, five fathoms in width and three fathoms in depth.)  
 (24) TOP[Paretétato dè he: táphros] FOC[áno: dià toû PEDÍOU]  
       was.carried PTC the trench up through the plain  
 FOC[epì DÓ:DEKA parasággas] FOC[méchri toû ME:DÍAS teíchous].  
       on twelve parasangs to the Media wall  
 ‘This trench extended up through the PLAIN for a distance of TWELVE parasangs, reaching to the wall of MEDIA.’ (X. An. 1.7.15) (transl. W. Heinemann: 1980)

(25) FOC[ORTHÔ:S toi] TOP[légei So:kráte:s].  
 rightly PTC says Socrates  
 ‘Socrates is just RIGHT.’ (Pl. *Phlb.* 28b)

In my reading, the subject *he: táphros* in (24) forms a syntactically unorthodox constituent with the verb in first position: they constitute the major topic with respect to the major focus constituent that follows. The verb turns out to be a ‘second-level’ focus, since it is first contrasted with the topical subject; the verb is focal with respect to the subject, but is only topical *with respect to the major focus constituent*. Likewise, in (25) the focus is contrasted with the topic *légei So:kráte:s*, in which another second-level contrast can be identified: that between the focus *légei* and the topic *So:kráte:s*. I rely on phonetics to detect pragmatic constituents when more than two constituents are present in a sentence: for example, the enclitic *toi* in (25) seems to clearly divide *orthô:s* from the rest of the sentence, forming with *orthô:s* a phonetic-semantic constituent. In (24), two main phonetic pauses are likely to occur: the former after *dé* and the latter after *táphros*. It seems plausible from the perspective of semantics that *táphros* is first to be connected with the verb and only then with the following constituent: that is, word order (i.e., syntax) and phonetics serve to pinpoint binary (pragmatic) constituents based on the topic-focus and focus-topic contrast. I admit that the precise rules according to which one identifies the single pragmatic constituents need extensive treatment, which cannot be outlined in the limited space available here. However, I hope that examples (10), (11), (18), and (19) have persuasively demonstrated that the contrast between the two configurations topic-focus and focus-topic play the central role in determining word order in AG, and that this contrast is operative at any level of the sentence (very presumably in a binary way).<sup>12</sup> I conclude with the definition of the principles so far illustrated, which, though formulated for AG, I suggest also operate in English and presumably in any other language:

THE PRINCIPLE OF THE FUNCTIONAL CONTRAST BETWEEN TOPIC AND FOCUS (PFCTF): the structural categories ‘topic’ and ‘focus’ can identify two configurations: topic-focus and focus-topic. The former is used to tie the sentence to the preceding discourse, while the latter expresses the speaker’s wish to immediately know something (as in questions), or let someone know something (as in answers). When being within the major pragmatic constituents, the contrast is more generally definable thus: the focus is iconically more prominent when it is in first position.

THE FIRST AND FOREMOST PRINCIPLE OF ANCIENT GREEK WORD ORDER (FPAGWO): words in AG are primarily arranged to identify the contrast topic-focus and focus-topic according to PFCTF. PFCTF operates binarily at any syntactic level of AG, from the morphemic to sentence level.

<sup>12</sup> It is to be noted that multiple focuses, such as *EGGÛS* and *en MELÍte:* in (15) and *kai KRITÓBOULOS kai ho PATÈ:R autoû kai éti HERMOGÉNE:S kai EPIGÉNE:S kai AISCHÍNE:S kai ANTISTHÉNE:S* in (17), do not violate the binary principle; rather, they can be regarded as forming new pragmatic/syntactic domains. In my parenthesization, some focuses may have been joined together for simplicity’s sake.

# Language Policy in Germany and Beyond

Wolfgang Viereck

University of Bamberg  
Obere Dorotheenstr. 5a; 96049 Bamberg/Germany  
wolfgang.viereck@uni-bamberg.de

## Abstract

In Germany and Switzerland the world-dominion of English was already predicted in the 19th century. While today the impact of English on German has alarming consequences for many, English lexemes often fill a welcome gap in the language. The role German politicians play in the German vs. English debate can at best be called ambivalent. The part they played in the discussions about the reform of the orthography of German, on the other hand, is strongly negative. The paper concludes with remarks on the language policy of the European Union.

**Keywords:** English in German; Konrad Duden, the Nazis, today's politicians and the orthographic reform of German; Globalisation and languages; European Union language policy.

## 1.0. English in German

Remarks on language policy in many countries today must necessarily also include comments on the impact of English on those languages. This was also the case in the past. Jacob and Wilhelm Grimm as well as Jacob Burckhardt were great names in the intellectual world of 19th century Germany and Switzerland respectively; the first two were philologists and the second a historian. As early as in 1874, Burckhardt had already predicted the coming world-dominion of English with the alarming consequence: "The only way to rescue books written in German is to translate them into English" (translated from German). 135 years later, statistics prove the dominance of English also in book production. In 2000 German-speaking people translated 5,519 books from English, whereas English-speaking people translated only 248 books from German. Although due to the general decrease of book titles translated into German the number of books translated from English also decreased, namely to 3,611 in 2005, but with 65% the translations from English were far ahead of other languages, such as French with only 10%.

Even a quarter century before Burckhardt, Jacob and Wilhelm Grimm expressed a specific misgiving about German in Chapter 6 of their *Deutsches Wörterbuch*: "It is the duty of linguistic research and, specifically, of a German dictionary to oppose the immoderate and unfounded penetration of the foreign word" (Grimm & Grimm 1854-1971, translated from German). A philologist called Grimm's dictionary a Pyrrhic victory of Germanistics. By opposing the foreign word, it was argued, words such as *Kultur* were missing in the dictionary. Such reproach, however, must be modified: The volume that was to contain the word *Kultur* only appeared in 1873, that is ten years after Jacob Grimm's death and fourteen years after the death of Wilhelm Grimm. It was for linguistic reasons that Jacob Grimm called English a world language (1864: 293).

I shall not deal here with the influence of English on German from a historical perspective (on these aspects see Viereck 2004). Indeed, since the Second World War the impact of English on German has assumed such dimensions that every attempt to record it fully becomes futile. As one might expect, mostly Americanisms occur and particularly in those areas that are connected with technical innovations, such as information technology or new technology, which is abbreviated as IT or NT in German publications (and of course, refers to the world of computers). Other fields include telecommunication from whence we get *Handy*, a pseudo-loan for English *mobile (phone) or cell(ular) phone*, youth culture (pop music), economics, fashion, science, politics and advertising. Of course, the English influence must not only be seen negatively. Anglicisms often fill lexical or semantic gaps in German and there are numerous cases where they are to be preferred for stylistic purposes as they convey American or British colour, precision, brevity, vividness, tone or simply variation of expression.

When a German equivalent cannot be found soon afterwards to replace it, then the English word will stay. Often the English word is shorter. Small wonder with a language where such linguistic monstrosities exist as *Steuervergünstigungsabbaugesetz* ‘law on the abolition of tax rebates’, or *Eierschalensollbruchstellenverursacher* ‘a device used to create breaking points in egg shells in order to allow one to easily remove the top part of an egg without causing the shell to splinter’ (Limbach 2005: 157), a matter of amazement or ridicule at least since Mark Twain (1880). Such recent English additions as *Mobbing*, *Dialler*, *Skimming* or *Phishing*, an artificial word created from *password fishing*, will no doubt not be translated into German. Yet in very many cases the use of English words in present-day spoken and written German is excessive, unfounded and thoughtless and it is quite natural that this meets strong opposition especially from those people who do not know (enough) English. A number of language societies exist in German-speaking countries today which publish lists from time to time of unnecessary Anglicisms with their German equivalents. The following table reproduces excerpts of such a list, which altogether comprises 2,000 words put together by members of the association “Muttersprache” in Vienna:

Loanword	Suggestion for rendering in German	Number of Synonyms
<i>Bar</i>	Schantisch, Schankstube, Schank, Tresen, Schenke, Alma mater alcoholica*	6
<i>Box</i>	Schachtel, Pferdestand, Montageplatz (car)	3
<i>Boom</i>	Hochkonjunktur, Blütezeit (economy)	2
<i>boomen</i>	blühen, wuchern	2
<i>Camping</i>	Zelten, Fahrt-	2
<i>clever</i>	klug, schlau, gewitzt, gerissen	4
<i>Container</i>	(Groß-)Behälter	1
<i>Diskette</i>	Speicherscheibe, Merkring*	2
<i>Dock</i>	Werft, Schiffsbaustelle	2
<i>Dress</i>	(Be-)Kleidung, Gewand	2
<i>Drink</i>	Trank, Trunk, Getränk	3
<i>Fair</i>	gerecht, ausgewogen, unparteiisch	3
<i>Festival</i>	Fest(spiel), Feier(spiel), Film-, Musik-,	

	Theaterfest	5
<i>fit sein</i>	in Form, gesund sein	2
<i>Fitness</i>	Gesundheit, Kraft, Ausdauer	3

(Muhr 2004: 41)

Several comments must be made with regard to this table. First, the number of German lexical equivalents for the 15 English words is 2.8 on an average. That means about three German words are necessary to render the content of an English loanword. This certainly cannot be called a facilitation of communication. Second, words marked with an asterisk (*Alma mater alcoholica* for *Bar* and *Merkling* for *Diskette*) are new creations, and are simply ridiculous. And finally, Muhr (2004: 41f.) shows that some of the German equivalents are inaccurate (those for *Dock*, *Boom*, *Drink*), as they do not render the content of the English word correctly and some are simply wrong (those for *Dress* and *Container*), as their range of meaning is too general. As becomes evident, some of these language societies do themselves a disservice. They “care” about the German language in such a way that they feel obliged to translate or render almost every Anglicism into German with sometimes ridiculous or inaccurate results. Cases in point are *Hingehet* for *Event*, *Klapprechner* for *Laptop*, *Prallkissen* for *Airbag*, *Denkrunde* for *Brainstorming* or *Nachsteller* for *Stalker*. Yet there are also cases where the suggestions should be supported, especially by journalists propagating them in their daily work. Of course, these puristic procedures have a long tradition in German-speaking countries. As is the case today, they have always found their staunch supporters and their fierce opponents.

## 2.0. The Role of the Politicians in Linguistic Matters

Only since very recently have German politicians taken a more active part in discussions about linguistic matters than they had done in the past. Unfortunately, some of their remarks are simply outrageous. In late 2005, the Prime Minister of Baden-Württemberg, one of the 16 states of the Federal Republic of Germany, pleaded on German TV for English to become the working language in Germany, whereas German should remain the language of the family, of leisure time and of the private sphere in general (Paulwitz 2006: 7). In this regard, he was “his master’s voice” and simply reiterated the views of the dominant big industry that strongly favours globalisation.

The politicians’ disregard for their mother tongue is also noticeable in Germany’s cultural policy. Up to last year the annual budget of German cultural institutions had been curtailed every year. In 2003 alone this led to the closing down of five cultural institutions abroad. Ironically, at the same rate as the globalisation folly grew, the German government cut down the financial means to teach German abroad. Whereas the government did not care enough – at least until 2007 - to maintain German abroad and to push the status of the language in international organizations, it showed an abstruse interest in the reform of its orthography with equally abstruse consequences to which I would like to turn now.

### 3.0. Duden, the Nazis, today's Politicians and the Orthographic Reform of German

In 1880 Konrad Duden, then director of a secondary school, published a slim volume entitled *Vollständiges Orthographisches Wörterbuch der deutschen Sprache* [Complete orthographic dictionary of the German language]. He accomplished something that has not been accomplished ever since, namely uniformity of spelling. Duden was very careful with standardizing the orthography; in 1901 he only abolished the *Th*, for instance, in *Thür* 'door' following the Prussian model, that has since been written without *h* and he noted in 1902: 6 "If one had wanted to introduce a thorough reform, one would have lost the ground under one's feet" (translated from German). The vision of so-called German thoroughness, however, remained. Linguistic societies, philologists and poets alike developed systems of their own – often with the use of small initial letters.<sup>1</sup> In 1920, a committee even advocated a "thorough phonetic reform". However, nothing happened until the Nazis came to power. Their plan, far beyond reforming the orthography of German, had a perfidious logic: In order to enslave a people one only had to shatter its cultural pride. The most effective way to do this was to disturb the people's linguistic self-confidence. A complete change of the orthographic system would lead to the downright upsetting of historical consciousness and to the devaluation of the writings of earlier times. Georg Schmidt-Rohr, a linguist who was head of the department of the sociology of language of the SS - the so-called "Schutzstaffel" of the Nazi party (Simon 1986) - , to whom we owe these "insights" was probably thinking of Turkey which had changed to the Latin alphabet in 1928. In any case, he thought something similar could be introduced in occupied eastern Europe. A new orthography for Ukrainian would set in motion a linguistic splitting up of the Russian empire, while in Poland, he thought, a new orthography could break up the Polish people's strong sense of history (on these aspects see Birken-Bertsch & Markner 2004).

However, the linguist's thoughts were not able to win over the Nazi bureaucrats – as some of them pursued similar aims, ironically for German itself. Of course, it was not called a breach with tradition which it actually was, but rather a "national awakening". The new, quite radical rules for the orthography of German were only published in 1944, fortunately too late to have any impact. At Hitler's request thousands of booklets had to be pulped. Yet the same people who worked out the rules for the Nazis continued their work after the war. In 1954 they published demands that were almost identical with those of 1944. For these people, as for some linguists today, orthography is the visible expression of language – if words are pronounced the same, they ought to be written the same. A present-day Swiss linguist formulated: "When someone reads something written, then (s)he transforms it to sound" (Saltzwedel 2004: 162, translated from German). However, if reading were to proceed like this, weeks would be needed to get through a daily paper. All these arguments are nothing but a justification for interfering with a well-established orthographical system and for prescribing new rules.

In 1996 a new attempt was made at reforming the orthography of German. The Ministers of Culture of the 16 German states decreed that the new rules should become compulsory for German schools and for those working in the civil service by August 1, 2005. However, it soon became clear that this was not likely to happen

without many changes. Millions of euros have been invested since 1996 in producing new dictionaries and school books. The Ministries of Culture exerted intense pressure on school book publishers threatening that if publishers remained critical of the orthographical reform no school books would be ordered from them any more. This threat did not remain without effect. In 2004, the new *Duden Rechtschreibung* appeared in its 23rd, completely revised and extended edition. It was reviewed in a leading German daily, the *Frankfurter Allgemeine Zeitung*, under the title “Das unmögliche Wörterbuch” [The impossible dictionary] (Ickler 2004). Some of the strangest rules were abolished there and new ones introduced following a decision of the Ministers of Culture taken in June 2004. The 24th edition of the *Duden Rechtschreibung* followed only two years later. It is quite clear that these changes made all the dictionaries worthless that had appeared between 1996 and - at least - 2004. Authors of literary works never followed the new rules, the daily paper just mentioned, soon reverted to the old spelling and punctuation again and two of Germany’s largest press publishers followed suit. In an opinion poll carried out in September 2004 only 11% of the population were in favour of the reform, 60% were against and 29% were undecided (*DER SPIEGEL* 43, 18 October 2004: 50).

When the politicians installed a Council of German Orthography in October 2004 they saw to it that the opponents of the reform were in the minority. The work of this Council remained patchwork, also because the ministers had decided beforehand what should be dealt with. Aspects of the reform that in their view were not controversial were banned from any discussion. Thus many shortcomings remain, which I cannot deal with here. Problems mainly concern the use of the hyphen, capitalisation, punctuation and the tricky area whether words are written together or separately. Ickler (2006) documents many strange results. I would, however, like to mention one example from the section on how words should be divided: according to the *Duden Fremdwörterbuch* of 2001 *Teenager* can be divided not only as *Teen-ager* ‘a boy or a girl between the age of about 13 and 19’, but also as *Tee-nager* which, taken literally, means ‘a gnawing animal which lives on tea leaves’! This nonsensical division was rectified in the subsequent eighth and ninth editions of the *Duden Fremdwörterbuch* that followed each other in an exceptionally short interval of only one year. All this shows how wise Konrad Duden was over one hundred years ago when he introduced only very few changes in order to preserve uniformity of spelling. The majority of the members of the speech community must find new rules sensible, otherwise they are not prepared to follow them. Decrees alone do not work any more. In the area of German orthography, at least, we find today a “collective disobedience”. There are now two ways of spelling: one of the ministers of culture and one of the people beyond school age and outside the civil service. Almost all German publishing houses today have their list of orthographic exceptions, an altogether impossible situation. This is what happens when politicians meddle in matters in which they are not experts. Rominte van Thiel draws our attention to another unbelievable consequence of the orthographic reform, namely the destruction of culture in German school libraries. She sums up the current situation by saying: “I do not know whether apart from the burning of the books by the Nazi 75 years ago there has been another ‘sorting out’ of books from libraries in Germany to the extent as is happening now” (2008: 4, translated from German).

#### 4.0. Globalisation and Languages

I have already mentioned the globalisation folly. *Globalisation* is a fairly new word. According to the *Oxford English Dictionary* (1989) it was coined in 1961; in the early 1990s it appeared as *Globalisierung* in German. Languages belong to the most important victims of globalisation. The unity of the market, the uniformity of its actors and the monotony of its language form the “survival-kit” with which its survival is ensured. It is, thus, in an unfortunate way consequential that with the increasing globalisation process the interest of the German government in maintaining German abroad diminished. The linguistic norm is English: *one world one language*. This linguistic unitarism is part of an ideology that reduces a complex sociocultural reality to such an extent that a simple “rational” action becomes possible with quick decisions. The only concern of the present-day global players is: How can the unitary language English be imparted to the new generation as early as possible and with the least possible expense? As already noted above, the people for whom this trend is so advantageous have the power to enforce such developments.

#### 5.0. European Union Language Policy

As an option for Europe and as a perspective for the world, multilingualism opens new ways and offers possibilities other than a world-wide uniformity. Let me continue and conclude with some remarks on the language policy of the European Union. On a supranational level, the preservation of European multilingualism has in principle been the aim of the European language policy ever since the 1950s; it is part of the European peace policy. After all, linguistic rights are human rights. The European Union quite consciously propagates a policy of multilingualism, not of bilingualism, because the preservation of many languages means the promotion of individual multilingualism and not of individual bilingualism. Those who are “only” bilingual, who know their mother tongue and English as a second language, tend to enforce the one foreign language they know as the only valid one; in the end they push forward a leading language policy. On the other hand, multilingual speakers who speak more than one foreign language attribute importance also to other languages, not just to one lingua franca. That is why the white book of the European Union postulated that every citizen should master three languages of the Community. That was also the demand made for the “European Year of Languages 2001”. This is the theory, which is nothing but a blue-eyed illusion. According to an opinion poll published in 2001, 47% of the population in Europe spoke no foreign language at all. However behind this average value enormous national differences are hidden ranging from 66% in the United Kingdom over Austria with 48% to Luxembourg with only 2%. In the Scandinavian countries the percentages are relatively low and in southern Europe relatively high.

Also the practice in inter- and supranational communication alone shows that reality differs widely from these self-imposed ideals. The European Council which propagates multilingualism uses only English and French as working languages and largely ignores German which with almost 100 million native speakers comes in first place in the European Union.<sup>2</sup> The same is true of other institutions, for example, the

WEU (Western European Union) in London, the EFTA (European Free Trade Association) in Geneva, the ESA (European Space Agency) in Paris and the broadcasting stations in Geneva.

Thirty-eight percent of the population of the European Union are of the opinion that it will be inevitable to have a common language for the internal communication of the European Union, especially after the enlargement of 2004 – as of January 2007, the European Union counts 27 member states -, but 47% are against that. How the 38% would react should they no longer use their own language, remains to be seen. According to these and other results the single leading language model does not seem to be feasible at present, not even for the internal communication of the European Union.<sup>3</sup> A policy of multilingualism, on the other hand, can only succeed with a conscious language policy and language planning. A laissez-faire policy that leaves the linguistic development to the laws of the so-called free market will in the long run lead to the monopoly of a single lingua franca, namely English. For the British government and the British Council this situation will, no doubt, have a most welcome economic effect, as has been the case up to now. The language issue in Europe is politically so sensitive that the politicians prefer to agree only on bland and fine-sounding platitudes in their policy white papers – statements which Phillipson (2003) dismisses as “EU rhetoric”. Regrettably the European Union has failed to consult the experts. What happens when language issues are left to the politicians on a national level has already been pointed out above. What is badly needed is a neutral European language policy. This debate should also include a discussion of the pros and cons of the use of the neutral planned language Internacia Lingvo, commonly known as Esperanto. Esperanto, for instance, facilitated the communication of the reconciliation talks between Korea and Japan. Also, the fairly new field of eurolinguistics is called upon here to work out a concept of multilingualism that by strengthening communication within and beyond single language families relativizes the absolute dominance of English. Such alternatives deserve to be seriously pursued.

## Notes

<sup>1</sup> See, for instance, an advertisement of Eomund (1907), in Waas (1967: 18), claiming that as soon as a child can pronounce the sounds of German clearly and is able to read, he/she will master orthography perfectly.

<sup>2</sup> In 2003 55% of the documents were published in English, 44% in French and only 1% was published in German. Consequently efforts are now being made on the German governmental level to introduce German as a third working language of the European Union and to place German on the same footing with the other two languages as a language of publication. The German daily *DIE WELT* noted that the German Parliament threatened to deal with European Union documents only when they reach Parliament in German (21 April 2006: 4). Two years later the Commission in Brussels refused to have these documents translated into German (*DER SPIEGEL* 12, 17 March 2008: 20). German politicians ignored far too long to put the status of their language on a par with both English and French on the European level and now it seems to be too late for that.

<sup>3</sup> According to a current opinion poll carried out in Germany only 13% of the Germans favour a common language in the European Union.

# **Crafting multilingual and intercultural identities in talk: I know a little about your language<sup>1</sup>**

**Erica Zimmerman**

United States Naval Academy  
589 McNair Road, Annapolis, MD 21402  
[zimmerma@usna.edu](mailto:zimmerma@usna.edu)

## **Abstract**

This article examines how the participants indicate multilingual memberships when engaged in talk about Korean language use. Talk about language use occurs when participants engage in talk that indicates that they are teaching/learning about a specific form and/or telling about how language is used. Typically, the introduction of Korean into a conversation involved the participants engaging in metalinguistic talk to make comparisons about the differences between the Japanese and Korean languages. Through this process, the participants construct identities, such as engaging in expert-novice roles and constructing multilingual speaker identity. The analysis will show that the participants are making comparisons about languages which construct various intercultural identities and show when and where the talk led to those occasions.

**Keywords:** Interculturality, Korean learners of Japanese, Identity, Conversation Analysis

## **1. Introduction**

This article will examine how the participants indicate multilingual memberships when engaged in talk about Korean language use. Talk about language use occurs when participants engage in talk that indicates that they are teaching/learning about a specific form and/or telling about how language is used. This was a fairly common subject among the participants and their interlocutors for both Japanese and Korean in this study. While there were occurrences of talk about language that focused purely on the use of Japanese by the participants in this study, this article will focus on occurrences where the use of Korean language was the main topic. The main reason for this is that these forms of talk about language also tended to invoke the participants' intercultural memberships.

Typically, the introduction of Korean into a conversation involved the participants engaging in metalinguistic talk to make comparisons about the differences between the Japanese and Korean languages. The participants then engaged in making comparisons, which led to the construction of mutual understanding about the language form in question. Through the process of making a comparison, the participants constructed various identities, such as engaging in expert-novice roles and constructing multilingual speaker identity. The analysis will show that in this case, the participants are making comparisons about the languages and in one case, indexes the stances of "I know a little about your language." The co-construction of their identities in talk as expert-novices led to indicating the participants' multilingual memberships as well. This article will explore when and where the talk led to those occasions to discover how the participants managed these intercultural moments.

## 2. Language expertise in interaction

One way to construct the identity of multilingual speaker is through orienting to expert-novice roles in conversations. The terms “expert and novice roles” originates from a reaction to the use of the classifications of native speaker and non-native speaker (Cook 1999; Firth & Wagner 1997; Kachru & Nelson 1996; Kasper 1997, 2004a; Rampton 1990; Schegloff, Koshik, Jacoby, & Olsher 2002). These researchers highlight that the field of second language acquisition imported the terms native and non-native speaker from Chomsky’s terminology as a way to categorize participants. Many researchers do not question the use of the categories native and non-native speaker; rather they accept these categories as unproblematic. However, Cook (1999) argues that the terms of native speaker, non-native speaker, and L2 learner are problematic because many researchers have essentialized their meaning, by assuming that the native speaker norm is the goal for L2 competence. In addition, many researchers do not account for the variables in a learners’ competence such as native speakers of one language having the ability to use another.

To avoid essentializing and assuming a speaker’s identity as a native or non-native speaker, Rampton (1990) suggests that researchers utilize the term expertise for categorizing participants. Expertise implies that the expert’s knowledge is not innate; rather participants can acquire or demonstrate his/her expertise through interactions with others. However, the demonstration of expertise in conversation is not symbolic of a speaker’s social group identity (Rampton 1990). This definition avoids the stereotypical understanding of what it is to be a native speaker.

In response to this debate, Conversation Analysis (hereafter CA) researchers’ main criticisms are that any category assigned to the participants prior to examining the talk, rather than seeing how the participants construct identity in conversation is problematic. That is, many non-CA researchers assume that, because the speaker is a non-native speaker, s/he will behave in interactions in a certain way such as making grammatical and pragmatic errors. Recent CA studies have addressed this issue of the categorization of participants as native/non-native identities versus expert/novice in the analysis of discourse (Carroll 2000; Hauser 2003; Hosoda 2002, 2004, 2006; Ikeda 2005; Kasper 2004a, 2004b, 2006; Koshik 1999; Mori 2002, 2004; Wong 2000a, 2000b, 2000c). These studies show that, on occasion, participants orient to their differential linguistic and cultural expertise. However, CA researchers tend to differ in the categories utilized for describing this identity work. Some have categorized the participants in the native-non-native speaker dichotomy (Hauser 2003<sup>2</sup>; Hosoda 2002, 2004; Ikeda 2005; Wong 2000a, 2000b, 2000c). Still others have used the terms expert-novice (Carroll 2000; Hosoda 2006; Kasper 2004a, 2004b). These later studies avoid the terms native and non-native speaker, because they believe that it is not the participants’ social identity as native or non-native speaker that is being orientated to. Rather, the participants are demonstrating differential language expertise (Kasper 2004a).

Hosoda (2006) exemplifies this form of analysis for Japanese with her study on repair in conversations among users of Japanese. She argues for the use of the terms target language expert and target language novice over native and non-native speaker, by demonstrating how language expertise is achieved as a part of the ongoing interaction. To arrive at mutual understanding, participants in conversation will engage in repair sequences when necessary. In segment 1, the participants engage in repair work for

*shigoto kankei no ryokou* ('work related travel').

**(1) Segment 1. From Hosoda (2006, p.20-21)**

**[Dean: L2 Japanese; Toku: L1 Japanese]**

1. Dean: *ano:: sigoto kankei no ryokou wa?*  
uhmm work relation Gen travel Top  
  
'Uhhh, how about work related travel?'
2. Toku: *nn? kankei?*  
Huh relation  
  
'Huh? Relation?'
3. Dean: *a:: sigoto kankei ryoukou a a ano (.) ryoukou zya*  
uhmm work relation travel uh uh uhm travel COP
4. *naku te ano tch e:: nihongo de wa wakan nai kedo*  
Neg and well tch uhm Japanese in Top know Neg but
5. *((cough)) (.) ano::: Osaka: e:: [ka Nagoya e::]*  
uhmm Osaka to or Nagoya to  
  
'Uhhh, work relation travel, uh, uh, uhm, not travel  
but well, tch, uhhh, I don't know {the word} in  
Japanese but uhhh, to Osaka or to Nagoya.'
6. Toku: *[ah syuttyou]*  
oh business trip
7. *desu ne.*  
COP:POL IP  
  
'Oh, you mean a business trip.'
8. Dean: *syuttyou aa SYUTTYOU.=*  
business trip oh business trip  
  
'Business trip, oh, business trip.'
9. Toku: *=syuttyou.=*  
Business trip  
  
'Business trip.'
10. Dean: *=hai. [°syuttyou°]*  
Yes business trip  
  
'Yes, business trip.'
11. Toku: *[u:::~:~:n] syuttyou wa desu nee,*

Hmmmmmmm business trip Top COP:POL IP  
*imanotokoro yotei nai desu ne.*  
for the time being plan NEG COP:POL IP

‘Hmmmmmmm, as for a business trip, for the time being, there is no plan.’

In segment 1, the roles of expert and novice are demonstrated through the repair sequence. Toku has trouble understanding Dean’s question which is signaled by the other- initiated repair in line 2. Dean attempts to self-repair in line 3 and elicits help, which is followed by Toku’s other-initiated repair in line 6. Dean accepts the other-initiated repair (line 8), and eventually the participants return to their original discussion (line 11). This sequence displays that the participants are seeking mutual understanding of Dean’s question.

Segment 1 is a typical example of an expert-novice interaction. This study will adopt the terminology of expert-novice when the participants orient to differential language expertise and will show that the multilingual identity can also be constructed. The use of the categories of target language expert and novice avoid the stereotyping that arises with the terms native and non-native speakers. That is, non-native speakers are always deficient in their language production.

As the analysis will show, there are many places in conversations where the participants are not concerned with linguistic errors. Previous expert-novice studies (Carroll 2000; Hauser 2003; Hosoda 2000, 2004, 2006; Wong 2000a) have typically focused **only** on the repair sequences as a demonstration of the roles of language expert and novice. This article will show that the expert-novice roles are just part of the complex identity constructions that occurred in my data when there is “talk about language.” This article will include more of the interaction than is typically provided in similar studies. This will allow for an analysis of the additional identity work that occurs in the interaction, such as a multilingual speaker identity and the interculturality of the participants.

This article will answer the following questions:

1. How does talk about language play a role in the participants’ negotiation of their identities?
2. Does this provide an opportunity for an orientation to interculturality, and if so, what occurs?

The analysis examines two areas: code shift and non-code shift events. The first example will demonstrate when the participants code-shift to engage in talk about language and indicate the identities of expert-novice and multilingual speaker. The participants accomplish the construction of the stance of “I know a little about your language.” The second example will demonstrate that the participants are engaging in talk about the Korean language without using a code-shift. Despite the lack of a code-switch, one of the participant’s indicates her orientation to her intercultural statuses. However, the participants’ sequential moves shift the talk away from further engagement in talk about language use. For both of the segments, the analysis will demonstrate how the participants’ orient to the category of multilingual speaker and on occasion the formation of intercultural understanding.

### 3. Data and Methodology

This article examined two segments from 45 hours of data, produced by two of the participants, Ji Eun Han and Mi Ran Na. The data was recorded in the Chubu area of Japan with other speakers of Japanese. The participants used mini disk recorders and the researcher was not present. These two segments are just two of many similar segments where the participants engaged in talk about language.

This study used a Conversation Analysis informed perspective for analyzing the data for the construction of identity following the seminal works of Sacks (1972, 1979, and 1992) and the collection of works in Antaki and Widdicombe (1998). Identity is defined as how participants display their orientations toward others in the talk to indicate their relationships and identities (Antaki and Widdicombe 1998). The basis for analysis is the use of Membership Categorization Analysis (MCA). MCA is the examination of the process of organizing and reorganizing people into categories or groups in conversation (Sacks 1992). Antaki and Widdicombe’s (1998) work propose three analytical practices in which identity can be examined. E. Zimmerman (2007) designated these practices as labeling (explicit categorization), description (formulating a category) and “doing” identity. The analysis for this study focuses more on how the participants are accomplishing the identities of expert-novice and multilingual speakers in the talk.

### 4. Code-shift in “talk about language:” Pronunciation comparisons: It sounds like...

This section will show when the participants are working together to work out the use of a Korean language form. This leads to the participants indicating their understanding of how this form works and engaging to “teach/learn” about a Korean phrase. The participants create a space for negotiating language similarities and differences to indicate that they want to know a little about another’s language. The analysis will demonstrate that, in addition to the roles of expert-novice, the participants accomplish further identity work for that of multilingual speakers.

Segment 2 involves a phonological comparison of what a language form sounds like to one of the participants. Ji Eun Han is a main participant, and she is talking with her friend. They are at a Korean restaurant and have just received their order. In the 25 seconds before the beginning of the talk in line 499, a song that contains the phrase *EMMA YA*<sup>3</sup> begins. We can hear clicking of silverware on the plate and chewing throughout the segment.

#### (2) Segment 2. Ji Eun Han MD 7 Track 2 (JH=Ji Eun Han A=a female friend)

498	(25.6) ((song starts in this pause and can hear sounds of them eating and serving up food))	(25.6) ((song starts in this pause and can hear sounds of them eating and serving up food))

521	A:	<i>un un.</i>	'uh-huh uh-huh.'
522		(9.4)	(9.4)

Segment 2 demonstrates one strategy for making pronunciation comparisons between two languages or dialects. Ji Eun Han and participant A orient to participant A's status of knowing about Korean, the Japanese Standard dialect and the Japanese Osaka dialect. In this segment, Ji Eun Han poses a question in response to a phrase of a song that is being played in background at the Korean restaurant they are eating at.

The segment begins in line 499 with Ji Eun Han directly questions participant A's knowledge of the Korean term EMMA YA ('mother'). Participant A's response in line 501-502, is a pronunciation comparison between EMMA YA ('mother') and *honma ya* ('really,' Osaka dialect). She provides the standard Japanese pronunciation for really (*honto da*) and then the Osaka dialect version. She then claims that the *honto da* is Korean. A 1.3 second pause occurs between this and the next line of talk. This pause is significant in that it indicates that something is not quite right. What follows shows this. Participant A provides a self-initiated self-repair that it is not Korean and then further clarification that it is Osaka dialect. However, this is not enough to fix the possible confusion as indicated by Ji Eun Han's response, which is a second question in line 506 as to whether in Osaka dialect they say EMMA YA. This question is a move for further clarification and denotes Ji Eun Han's confusion with participant A's previous utterance. In line 510, participant A reiterates that she hears EMMA YA as *honma ya* clarifying her position. It is immediately following this that there is an indication that participants finally arrive at a

shared understanding of the meaning in lines 510 and 511 when A suggests that EMMA means *okaa* ('mother') in Japanese and this is confirmed by Ji Eun Han.

The identity construction in this segment is complicated because the identities of expert-novice and multilingual speakers are happening simultaneously. As far as the expert-novice roles are concerned, the two participants share this role. Participant A attempts to show her expertise in lines 501-502 by providing a comparison between the two languages. However, she had to self-repair when she made a mistake in the language she was referencing. The role of expert shifts to Ji Eun Han in line 511 after a question from participant A requests confirmation of the meaning of *EMMA YA* with *okaa*. In this example, it is not a matter of a non-native linguistic disfluency that leads to repair. The repair occurs with the "native speaker." Thus, the expertise constructed here is for comparing language forms in two languages.

In regard to the other identity constructions that occur in this segment, participant A constructs the identity of multilingual speaker for Ji Eun Han by asking for confirmation about the meaning of *EMMA YA* in line 510. Participant A is demonstrating that this is how she hears Korean and therefore Ji Eun Han's language. The identity of participant A is also constructed as a multilingual speaker of two dialects. She not only compares Osaka dialect and standard Japanese despite the repair that occurs in line 502, but she also provides her perspective as to how she hears *EMMA YA*. Through this exchange, the two participants are sharing their respective languages indicating their intercultural memberships. The comparisons of the languages indicate the participants' orientation to arriving at an understanding of the words under discussion. The participants' multilingual speaker identities are made relevant as a part of the comparison making process. In the end, the participants construct the moment as intercultural by showing that "I know little about your language."

## 5. Comparing Japanese and Korean without a code-shift: Talk to move away from talk about language

In the previous section, the analysis explored ways in which a code shift and pronunciation comparisons between Japanese Osaka dialect and the Korean language became the focus of the interaction as a means to discover more about Korean. In turn, various identity constructions evolved from that talk, such as multilingual speaker and expert-novice. This section will also focus on how comparisons are made, but this time, there is no code-shift to a Korean word that occurs. The analysis shows that while one participant wants to move to talk about linguistic practices, the other participant avoids this by indicating his lack of interest. In segment 3, Mi Ran Na and her male friend are driving in her friend's car. Participant B, the male friend, is driving and Mi Ran Na is the passenger. The two participants start to talk about snow after seeing the freshly fallen snow on the ground outside the car window.

Before getting into the analysis of what the participants accomplish here, an explanation of the differences that Mi Ran Na brings to the floor is necessary. Both Japanese and Korean have borrowed Chinese characters (Kanji for Japanese and Hanja for Korean) and a Chinese-like pronunciation for some words. The original Chinese pronunciation in both Korean and Japanese was adjusted to fit the respective languages. South Koreans have for the most part stopped using the Chinese characters except for a few instances such as the print media and names, but the pronunciations remain a part of the language. In Japanese, the word for snowball fight is *yukigassen* (雪合戦) which means in English snow war or battle. Mi Ran Na provides the non-existent word of *yukigenka*, (‘snow fight’) which is the Japanese pronunciation of what she proposes would be the Korean way of constructing the word with Chinese characters. If this were a word, it would be the following characters: 雪喧嘩. The Figure 1 shows a representation of these words.

<b>Snowball Fight</b>	
雪合戦	雪喧嘩
<i>yukigassen</i>	* <i>yukigenka</i>
snow battle	snow fight
(Japanese word)	(Non-existent word in Japanese)
	눈싸움
	<i>nwun ssa wum</i>
	Snow fight
	(Korean word)

Figure 1. Snowball fight

The talk about language here stems from what was seen outside the window of the car (fallen snow). Participant B suggests that they could make snowmen (*yukidaruma*) in line 59 to which Mi Ran Na seeks confirmation of what she had heard in line 63. This exchange is an example of novice seeking confirmation from an expert about a word. From here, participant B proposes another possible snow activity, *yukigassen* (‘a snowball fight’). At first, it appears that Mi Ran Na, as the novice, is seeking confirmation of that word too as seen by participant B’s interpretation and response of *soo soo* (‘yes yes’) in line 69. However, this is where the participants transition from a confirmation check to an instance of a clarification check. Min Ran Na indicates she needs further clarification by asking a question that seeks out why the term is not formed in another way in lines 71-79. She tries to create another opening for an expert-novice exchange about language in line 79 with her reference to Korean’s use of a word that means snow fight. While participant B at first shows interest with his response of *a soo na no?* (‘is that

so?') in line 82, participant B makes clear his indifference about engaging in these roles with a disaffiliative move in line 88 with *docchi demo ii janai?* ('either is okay right?'). In response, Mi Ran Na questions this indifference in line 89. He responds however in line 91 with *anmari kodawari wa nai yo.* ('I won't dwell on it.'). This disaffiliative move thus, shifts the topic from the debate over terminology to things participant B will dwell on.

Thus, the two participants engage for a brief moment in metalinguistic talk when Mi Ran Na brings up the differences between the conceptualization for the compound for snowball fight in Japanese and Korean. Her suggestion for how the word is said in Korean brings to the forefront of the conversation her identity as a Korean speaker. Participant B in response provides a disaffiliative move indicating his indifference and shifts the topic. Mi Ran Na does not challenge this shift in topic and complies by engaging in this new topic. The identity constructions in this segment differ from the previous segment where the two participants mutually engaged in the exchange to discover about the other's language. In this case, Mi Ran Na constructs herself as a multilingual speaker who is trying to find out the differences between Korean and Japanese. However, participant B sequential indicates his unwillingness to engage in the topic and does not work to further explore her identity as this multilingual speaker. Participant B avoids engagement in talk about lexical conceptual differences. While participant B does not work to construct his own interculturality, Mi Ran Na constructs their intercultural differences through this comparison. Participant B's shift to another topic avoids further development of this potential intercultural topical talk.

## 6. Conclusions

These two segments, while both involving talk about language, resulted in different outcomes. Ji Eun Han and her interlocutor arrived at a shared understanding for the term they were discussing. Mi Ran Na and her interlocutor did not pursue finding an answer for her question. There could be a couple of reasons for this. In segment 2, the word in question is a real word that is compared to another real word. In segment 3, however, Mi Ran Na is asking her participant to engage in talk about word that does not exist in Japanese. For him, this is not a matter for pondering because the words are just different. Thus, their talk ends up being redirected to a more concrete topic which is the act of dwelling on something. This is an area that participant B can comment or is willing to comment about because Mi Ran Na is remarking about his personality. Thus, one possible reason for the different results here is the type of word that is being compared. In both segments, the participants construct their expertise and multilingual identities. The outcome of the talk however is shaped by the participants' uptake of the topic.

This analysis demonstrates that more than just expert-novice identities can be constructed in topical talk about Korean language pronunciation and usage. In segment 2, the participants created a space for a pronunciation comparison between Japanese and Korean constructing the multilingual identity as a salient aspect of the talk. The participants' conversational activities for talk about language indicated an exchange of intercultural information and provided an opportunity for the speakers to have an intercultural moment. The talk indicates that the participants are engaging in discussions that broaden their understandings of the language, their cultures, and each other. However, as shown in segment 3, the Japanese participants did not always take up the topic of talk

about language and display interest in the other's language. Instead, the participant B successfully redirects the talk to a topic he will engage in. While the main participant's identity as a multilingual speaker is made salient for a moment, the two speakers do not pursue the topical talk that could develop further intercultural understanding.

The analysis shows that for Ji Eun Han and Mi Ran Na, it was not the non-native status that was relevant for these interactions. Instead, the participants construct, through various conversational practices, the identities of expert-novice, multilingual speaker, topic avoider, and intercultural identities. The talk about language in these two segments indicates that the participants engaged or attempted to engage in discussions that could broaden their understandings of the Korean language. As segment 3 showed, this activity can be sometimes redirected to avoid the topic altogether.

The implication of this study reinforces that researchers must look carefully at the participants' joint productions of identities as produced within the sequential moves of the talk. These findings also suggest that the process of constructing one's identity does not stop at the repair sequence. If the analysis had stopped there, the complex identities that followed would not have been discovered. It also demonstrated that there are various agendas for the talk (segment 2, an intercultural moment, segment 3 avoiding further engagement in intercultural talk). In addition, it also shows that the assumption of identity as found in many identity studies, especially in intercultural situations, could lead to stereotyping and misdiagnosis of the identities constructed by the participants.

Further research is needed in the area of language expertise to discover other ways in which the expert-novice roles can be activated. In this case, the talk about language was one avenue which led to indicating the participants' intercultural memberships. The participants can work to discover more about each other and the target language under discussion through talk about language.

# A Compositional Approach to the Topic-Comment Articulation in Japanese

Hiroaki Nakamura

Department of Liberal Arts, Japan Coast Guard Academy  
5-1, Wakaba-cho, Kure City, Hiroshima, JAPAN  
hiroaki-nakamura@ax2.mopera.ne.jp

## Abstract

This paper<sup>1</sup> argues that information-packaging in Japanese is induced by the lexical property of the topic particle WA. Assuming that the information packaging derives the tripartite structure comprising the topic operator, restriction and nuclear-scope, I show how the syntactic parse translates topicalized sentences into tripartite semantic structures in a strictly compositional way. I also argue against the topic-as-entity theory because the topic particle can mark a wide range of expressions which are assumed by a speaker to be familiar to hearers.

**Keywords:** information-packaging, topic-comment articulation, categorical grammar, compositional semantics.

## Introduction

The purpose of this paper is to present how to partition sentences into the topic and comment parts in terms of the syntax-semantics interface. We will use one syntactic property of the discourse particle WA to map topicalized sentences into the tripartite structure proposed in Partee (1991), Hajicova et al. (1998). We will not go into the detail about the semantic characterization of what the topic marked expressions denote. We will show the function of the topic marker cannot be explained by the file card metaphor as in Portner & Yabushita (1989), for instance, because WA can follow a wide variety of expressions including nouns, postpositional phrases, nominalized open propositions. This fact force a challenge to any theory employing a simple file-card metaphor. There is a crucial difference in WA-GA and definite-indefinite counterparts.

---

<sup>1</sup> Variants of this material have been presented in whole or in part at LENLS 2007, PACLIC 20, and the Workshop on Dynamic Syntax (the Tohoku University 21st Century COE Program in Language, Brain and Cognition). I'd like to thank the audiences at those presentations, and especially Key Yoshimoto, Norry Ogata, and Ruth Kempson for their helpful comments.

It has been noticed that topic phrases must be definite, referring to familiar entities or those which can be inferable from contexts. First, let us observe a typical context in which the subject-marked and topic-marked nominals show up.

- (1) Mukasi, mukasi, ... kappa-to yobarer-u osorosii ikimono-ga sunde-orimasita.

Kappa-wa iro-ga kimidori-de, karada-ni ke-ga nai doobutu-de, sakana-to kame-to saru-ga mazatta-youna sugta-o siteimas-u.

*Once upon a time, there lived a terrifying creature called a kappa. The kappa was a yellow-green, hairless creature that looked like a cross between a fish, a turtle and monkey.*

It has often been argued that the subjects of kind- or individual level predicates are marked with the topic marker WA, while the subject of stage-level predicates with the nominative marker GA, when they introduce new discourse referents into context, as illustrated in (2) and (3). However, even in sentences stating inherent or enduring properties of individuals, if the referents of the subjects are unfamiliar to hearers, they must be marked with the nominative GA as shown in (1).

- (2) a. *Uma-wa ninjin-o taber-u.*

horse-Top carrots-Acc eat-Pres

'Horses eat carrots.'

- b. *Uma-ga ninjin-o tabete-ir-u.*

horse-NOM carrots-Acc eat-Prog-Pres

'Horses are eating carrots.'

- (3) a. *Uma-ga ninjin-o tabar-u.*

- b. *Uma-wa ninjin-o tabete-ir-u.*

(2a) is a typical kind-level sentence, and (2b) a stage-level sentence with the progressive verb form. If the subject of a kind-level/individual predicate is marked with the nominative marker, as in (3a), it must receive an exhaustive listing interpretation, so (3a) means only horses eat carrots. If the speaker assumes the subject of a stage-level predicate is given/familiar to a hearer, it can be marked with WA, as shown in (3b), or often can be omitted because Japanese is a pro-drop language.

But we should not jump to the hasty conclusion, along the lines just sketched, on the relation between genericity and topic-marking because we can easily find many examples in which the subjects of individual/kind-level predicates are marked with nominative marker.

- (4) a. *Syogakusei-desae* [<sup>?</sup>*uma-wa/uma-ga* *ninjin-o taberu*]-koto-o *sitte-iru.*

school child-Even [horses-Top/horses-Nom carrots-Acc eat]-Comp-Acc know-Pres

'Even elementary school children know that horses eat carrots.'

- b.\* *Nani-wa/Nani-ga ninjin-o tabemasu-ka.*  
 What-Top/What-Nom carrots-Acc eat-Pres-Q  
 'What eat carrots?'
- c. *Dono doobutu-wa/doobutu-ga ninjin-o tabe-masu-ka?*  
 Which animal-Top/ -Nom carrots-Acc eat-Pres-Q  
 'Which animals eat carrots?'
- Dore-mo tabe-masen.*  
 'None.'

In embedding clauses, the subjects has a strong tendency to be marked with nominative case. In interrogative sentences, we never say *\*dare-wa* 'who-Top', *\*nani-wa* 'what-Top', *\*doko-wa* 'where-Top', etc. regardless of the predicate types. Only presuppositional complex question forms comprising *which* plus common nouns can be marked with WA, often with contrastive connotation, which imply that speakers assumes the hearers should have known the set of individuals among which they should choose one as an answer. The point is that even if the subjects are marked with nominative in (4a) and (4b), the whole sentences are taken to be generic, expressing an enduring properties of the subjects. In questions introduced by the complex *which*-forms as in (4c), the existence of the referents is presupposed. Therefore, the negative response to (4c), *Dore-mo tabe-masen*, sounds a bit odd because it conflicts with this presupposition.

It is often assumed that the topic marked expressions are outside the scope of negation.

- (5) a. *Uma-wa ninjin-o tabe-nai.*  
 Horses-Top carrots-Acc eat-Neg-Pres  
 'Horses don't eat carrots.'
- b. *Uma-ga ninjin-o tabe-te-inai.*  
 eat-Prog-Neg-Pres  
 'Horses are not eating carrots.'
- c. *Uma-wa ninjin-o tabe-te-inai.*  
 'The horses are not eating carrots.'

(5a), still maintaining the existential presupposition of horses, asserts that horses have a property of not eating carrots' while (5b) means that there is no horse which is eating carrots now. In (5c), the existence of some specific is taken for granted from the context. Given the data so far, it seems that we have two possibilities concerning the GA-WA alternation for subject marking. One possibility is that the topic-comment structure is default in Japanese, so originally WA-marked expressions may be marked

with nominative when they are focused, but this speculation seems simply wrong. We will defend another possibility, suggesting that topic marking has nothing to do with case marking, and that topicalization is a defocusing process, as assumed in Japanese linguistics.

There is another important property of the topic marker WA, as repeatedly pointed out by the Japanese traditional grammarians. Though the case marker GA never marks constituents other than subjects regardless of its meaning, WA can follow a wide variety of expressions, such as common nouns, postpositional phrases, nominalized open propositions, etc.

(6) a. *Kyoto-ni-wa takusan-no gaikokujin-ga yatte-kur-u.*  
 Kyoto-to-Top a lot of foreigner-NOM come-Pres  
 'To Kyoto, a lot of foreigners come.'

b. \**Kyoto-ni-ga takusan-no gaikokujin-ga yatte-kuru.*  
 Kyoto-to-Nom

(7) a. *Are-ni mieru-wa tyatsumi-ja naika*  
 Over there can-see-Top tea-plucking-BE-Neg-Q  
 'Lit.: Is what we can see over there tea-plucking?'

b. *Boku-ga itta-toki-wa dare-mo inakat-ta.*  
 I-Nom went-when-Top anyone be-Neg-Past  
 'When I went there, no one was found.'

c. \* *Boku-ga itta-toki-ga dare-mo inakat-ta.*  
 I-Nom went-when-Nom anyone be-Neg-Past

The possibilities of topic-marking of various expressions force a challenge to any explanation of the topic marker WA based on a simple file-card metaphor. In principle, there is no need to associate the notion of topic with individuals. Instead, if the notion of topic has something to do with presuppositions, it should denote a kind of proposition. In the next section, let us develop this idea.

## 1. Formulation of the Notion of Topic

### 1.1. Topic and Existential Presupposition

Following Partee (1991) and Hajicova et al. (1998), we assume here that the topicalization can be connected with quantification, according to which sentences with topics are translated into the tripartite structure comprising the topic operator, restrictive

clause and nuclear scope. In some traditional approaches, WA is often argued to have historically been developed from the particle introducing conditional clauses, so we will use the implication relation to express the interpretation of topic. Peregrin (1996) defines the meaning of topic as follows: || indicates presuppositions:

- (8)  $|X| = ||X||$  if X is a sentence.  
 $= ||\exists y.y=X||$  if X is a term.  
 $= ||\exists y.X(y)||$  if X is an unary predicate.

If a common noun is followed by the topic marker WA, as in (2a), we have a translation like  $||\exists x.Horse'(x)||$ . The definition as in (8) allows a wide variety of expressions to be interpreted as topics, exactly as seen in the examples given so far. As for the truth condition of sentences with topics, therefore, a topicalized sentence should be taken as a kind of implication, but since its restriction part denotes a (existential) presupposition, it should not be canceled by negation. Let us assume therefore that if the topic, mapped into a restrictor, is false, the whole sentence has no meaning at all. Only if the meaning of topic is true, the topicalized sentence has the value.

- (9)  $Top\ x[P(x) \rightarrow Q(x)] = T$  iff  $P(x) = T \ \& \ Q(x) = T$   
 $= F$  iff  $P(x) = T \ \& \ Q(x) = F$   
 $= 0$  iff  $P(x) = F$

We do not need to go into the detailed meaning of topicalized phrases including so called contrastiveness further here, because our concern is to parse topicalized sentences and translate them into rough semantic interpretations with the tripartite structure, assuming that the speaker thinks that the referents of WA marked expressions are explicitly given in discourse or inferable using the hearer's knowledge.

An example of translation is shown in (10b) we get from generic sentence (2a), ignoring genericity here:

- (10) a.  $Top\ x[Horse'(x) \rightarrow Eat'(Carrots', x)]$   
b.  $Be\_eating'(Horse',Carrot')$   
c.  $\exists x[Horse'(x) \ \& \ \forall y[y=x \rightarrow Eat'(y, Carrot')]]$   
d.  $Top\ x[Horse'(x) \rightarrow Be\_eating'(x, Carrot')]$

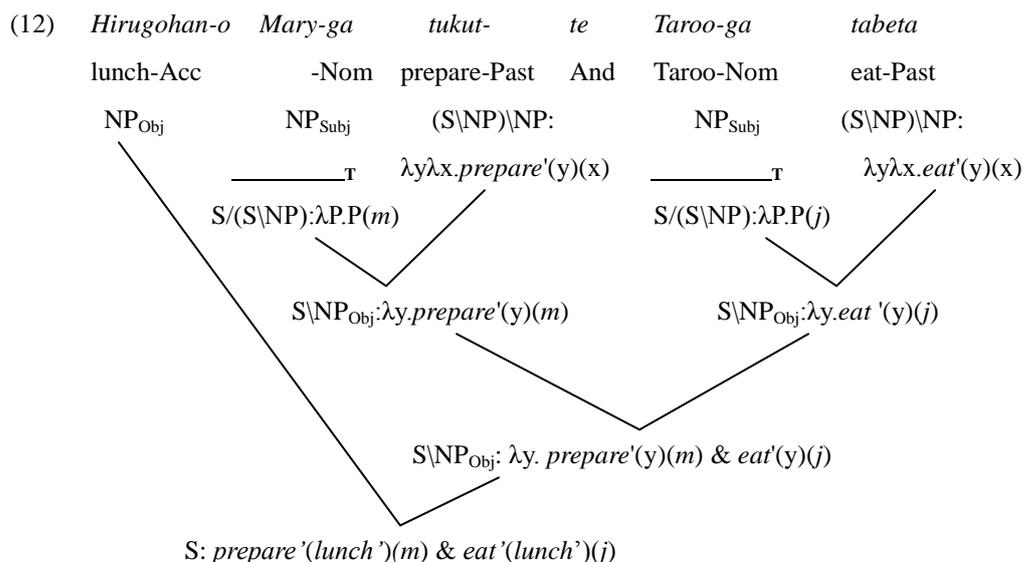

Based on the data given so far, I reject the idea that WA-marking vs. GA-marking simply reflects the distinction between kind/individual-level vs. stage-level predicates, or categorical vs.thetic judgments. Now I introduce some syntactic parsing mechanism using a version of categorial grammars.

## 1. 2. *Combinatory Categorial Grammar*

To set up the syntax-semantics interface, let us adopt a version of Categorical Grammars called Combinatory Categorical Grammar (hereafter, CCG), developed by Steedman and his followers. Each connector is defined using a directional slash ‘/’.

- (11)a.  $X/Y:f \quad Y:a \Rightarrow X:fa$                        $Y:a \quad X\backslash Y:f \Rightarrow X:fa$   
 b.  $X/Y:g \quad Y/Z:f \Rightarrow_B X/Z:gf$                        $Y\backslash Z:f \quad X\backslash Y:g \Rightarrow_B X\backslash Z:gf$   
 c.  $X:a \Rightarrow_T T\backslash(T/X)$                       or                       $T/(T\backslash X): \lambda f.f a$

(11a) is the rule of function application. An expression of functional category  $X/Y$  combines with an adjacent argument of category  $Y$  to yield an expression of category  $X$  and interpretation  $fa$ , the result of applying  $f$  to  $a$ . This rule, for example, combines a transitive verb with an object to yield the verb phrase, and then, combines the verb phrase with a subject to produce the sentence. The rule of function composition (11b) allows a higher functor of category  $X/Y$  to combine with a subordinate function of category  $Y/Z$  to yield a new function of category  $X/Z$ . (11c) is the rule of type-raising, and in what follows, we suppose that type-raising is triggered by a lexical property of the particle *WA*. We will devise a version of type-raising rule to deal with a wide range of topicalization phenomena. This operation can be invoked to convert a subject NP, which would normally be an argument to a verb phrase of category  $NP\backslash S$ , into a function looking forward for a verb phrase to produce a sentence,  $S/(SNP)$ . In order to see how the rules in (11b) and (11c) interact, consider (12), the case of scrambling in Japanese:

In (12), the verbs *tukur* ‘prepare’ and *taber* ‘eat’ of category  $(S\backslash NP)\backslash NP$  cannot combine with the object at first because the object *Mary* is preposed. Thus, they have

to combine with the subjects *Mary* and *John* by function composition first, which are type-raised into the functions taking the verb phrases as argument. The resulting expression *Mary-ga tukur-te Taroo-ga tabeta* of category  $S \setminus NP_{Obj}$  finally combines with the dislocated object *Mary*.

In English, prosody or dislocation of constituents to the left is used to mark topicalized elements (we ignore intonation here), while topics in Japanese are morphologically marked with the topic marker *WA*, which invokes a special (lexical) type-shift in (13):

(13) Type Shift rule for Topicalization

$$\begin{array}{c}
 -WA \quad := \quad (S_{Top}/(S \setminus X)) \setminus X \quad \text{where } X = NP, PP, \dots \\
 \quad \quad \quad \swarrow \quad \searrow \\
 \quad \quad \text{restrictor } (X) \quad \text{nuclear scope } (S \setminus X)
 \end{array}$$

$$X_{WA} \quad := \quad S_{Top}/(S \setminus X): \text{TOPIC } x[P(x) \Rightarrow Q(x)]$$

In (13), the category of a topicalized expression is a functor which takes an open proposition, yielding a (matrix) sentence with the topic-comment structure. A topicalized expression of category  $X$  corresponds to the domain restriction and an expression (remaining part of the sentence) of category  $S \setminus X$  denotes the nuclear scope. The former refers to the context and the latter updates or adds information to the context given by the former (plus the preceding context). The function of category (9) for *WA* is twofold: one is to divide a sentence into two predicates, one represents a restrictor which is the locus of update and the remainder (open proposition) updating the information state, resulting in a tripartite information structure including the TOPIC operator. The second function of (9) is to make a gap in a open proposition (i.e. a nuclear scope) which is underspecified with respect to its category and position so that an expression of any category can be marked with the topic marker *WA*.

## 2. Derivation of Topicalized Sentences

Some important characteristics of the topic particle *WA* has been proposed by many Japanese traditional grammarians, who claim to carefully distinguish the topic particle from other case particles including *GA*. We already noted that the topic does not follow question words with the exception of *which* + noun form. The former also marks expressions of various categories including postpositional phrases, subordinate

the topic particle is required to express coherence with matrix verbs, following the traditional grammarians, we can see the difference in grammaticality between (17a) and (17b):

- (17) a. *Uma-ga taber-u mono-o osiete-kudasai.*  
 horse-NOM eat-Pres things-Acc teach-Pres.  
 'Please tell me what horses eat.'  
 b.\* *Uma-wa taber-u mono-o osiete-kudasai.*

The embedded clause states a permanent, inherent property of horses, but the subject can never be marked with the topic particle, because horses cannot be in concord with osiete-kudasai, a polite imperative form addressing the hearer, as seen in (18):

- (18) \* *Uma-wa taber-u mono-o osiete-kudasai.*  
 horse-TOP eat-REL.CL things -ACC teach-PRES  
 S<sub>Topic</sub>/(S\NP) (N/N)\(S\NP) N NP\N S\NP<sub>Acc</sub>
- 
- \*

Japanese traditional grammar, as in Oono (1991), classifies sentences into two types: topicalized, which present topics and add statements about topics, and presentational, or thetic (presentationa) sentences. They have treated the topic particle and case markers like GA in a quite different manner, but since Kuno's work, the contrastive study between WA and GA has ruined this tradition.

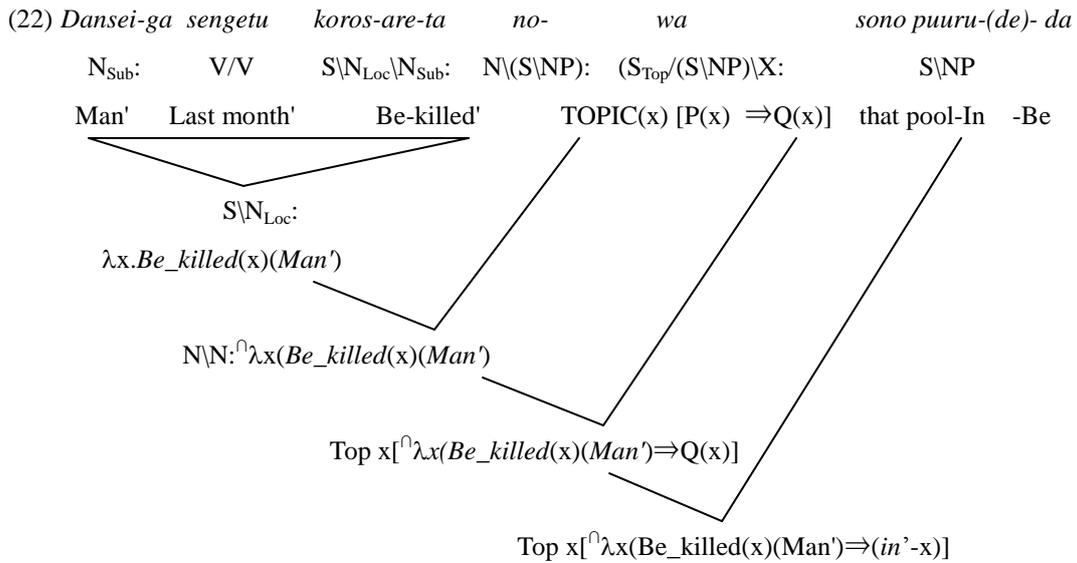

I am also suspicious about the topic-as-entities theory using the file-card metaphor because WA follows a wide variety of expressions, as we have seen above. In Japanese cleft constructions, the focus-frames can be marked with the particle WA. In the case of (17), which has a focus on Kyoto, the speaker assumes interlocutors are familiar with the fact that a man was killed last year somewhere.

- (19) a. *Dansei-ga kyonen SONO PUURU-de koros-are-ta.*  
 man-Nom last year that pool-in kill-Pass-Past  
 'A man was killed in the pool last year.'  
 b. *Dansei-ga kyonen koros-are-ta-no-wa sono puuru-(de)-da.*  
 man-Nom last year killed-Past-Nom-Top that pool-(In)-Past  
 'It is in this pool that a man was killed last year.'

In old Japanese, WA often directly attaches to sentences, as in (7a). But In

modern Japanese, the nominalization operator is necessary to convert propositions or open propositions to nominals.

- (21) Nominalization Operator *NO*  
 $no := N \setminus (S \setminus NP) : \lambda x \lambda P \wedge [P(x)]$

The topicalized expression is an open proposition in (20), which denotes an event, not an entity/entities. Our definition of the topic marker *WA* allows not only entity-denoting expressions but also property-denoting, event-denoting expressions to be presented as topic in Japanese sentences. On the other hand, the topic-as-entities theory may have much difficulties in dealing with such various topic expressions in a unified manner.

### 3. Some Consequences from the Proposed Analysis

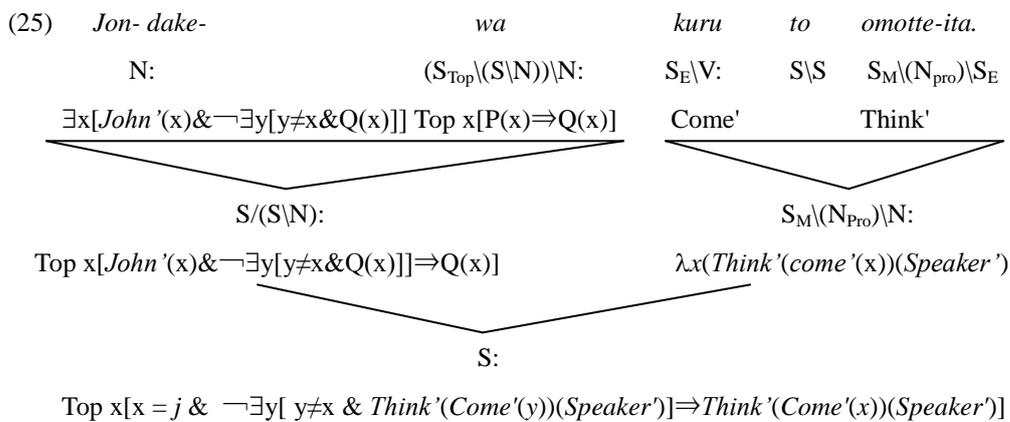

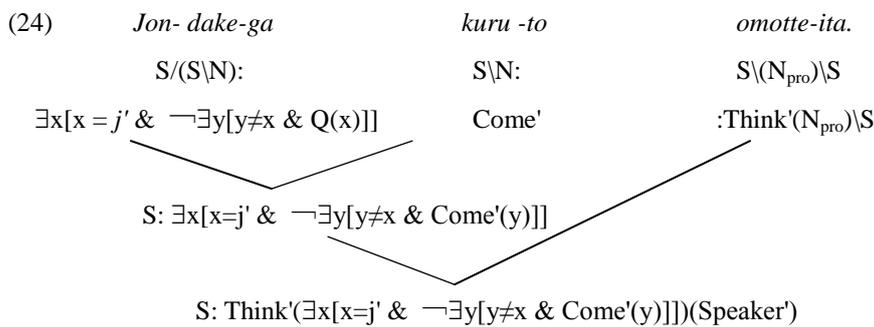

So far, we have argued that *WA* induces a kind of concord/coherence with a sentence final predicate, presenting some expression as topic, and assembling the remaining parts of the sentence as comment. Let us consider another example, which seems to support our definition of the topic particle. Portner & Yabushita (1998: 140, (38)) note the following contrast:

- (23) a. *Jon-dake-ga kuru to omotte-ita.*  
 John-only-Nom come Comp thought  
 'I thought that only John would come.'

- b. *Jon-dake-wa kuru to omotte-ita.*  
 John-only-Top come Comp thought  
 'John is the only one who I thought would come.'

They say that the subject of a clause embedded under an attitude verb *omotte-ita* 'thought' behaves in a semantically differently manner, depending on whether it is topic-marked or nominative-marked. In the case of (23a), with a nominative subordinate subject, *Jon-dake* 'only John' gets narrow scope with respect to the attitude verb. In contrast, in (23b), with a topic-marked embedded subject, it gets wide scope. It is clear, therefore, that the presence of a topic marker can have a semantic effect. They try to the difference purely in terms of the semantics of topic.

We can give a different account to the contrast observed in (21) from a compositional point of view. In our, and traditional Japanese grammarians' account, only the nominative case is assigned to the embedded subject. On the other hand, once it is followed by the topic-marker, it assembles all elements following it including the sentence final attitude verb, as the comment. The derivations of (23a) and (23b) are shown in (24) and (24) respectively, positing very simple meaning of *dake* 'only' here, ignoring its own presupposition.

Let us ignore the phonologically null matrix subject here. Using the combinatorial rule function composition allows all the elements following the topic

phrase to be assembled and result in a non-standard constituent *kuru-to-omotteita* '(I though *x* would come'. I think there should be more to be said about the interpretation of the WA-phrase in (23b)(which seems to convey contrastive implicature, like 'at least John'). All that I want to show here is that the topic particle induces concord/coherence with the matrix predicate.

So far we have examined only topic phrases appearing at the sentence-initial position. We have attempted to develop a mechanism with incremental parsing, in which once a parser encounters a topic phrase, it automatically assembles the remaining part of the sentence as a non-standard constituent, which is triggered by the concord/coherence property of the topic marker itself. We do not need to know where is a gap which corresponds to the topic within this constituent. Let us note here another property of the Japanese topic marker here. So far we have dealt with constructions in which topicalized expressions appear sentence-initially, which are in harmony with the standard process of information update. The topic particle, however, can also mark sentence-internal expressions, which should be problematic for a simple tree structure analysis like (4). Let us take (26) as an example.

- (26) Context: A minister is questioned at the congress about the bribes he allegedly received. An article in the newspaper reports:

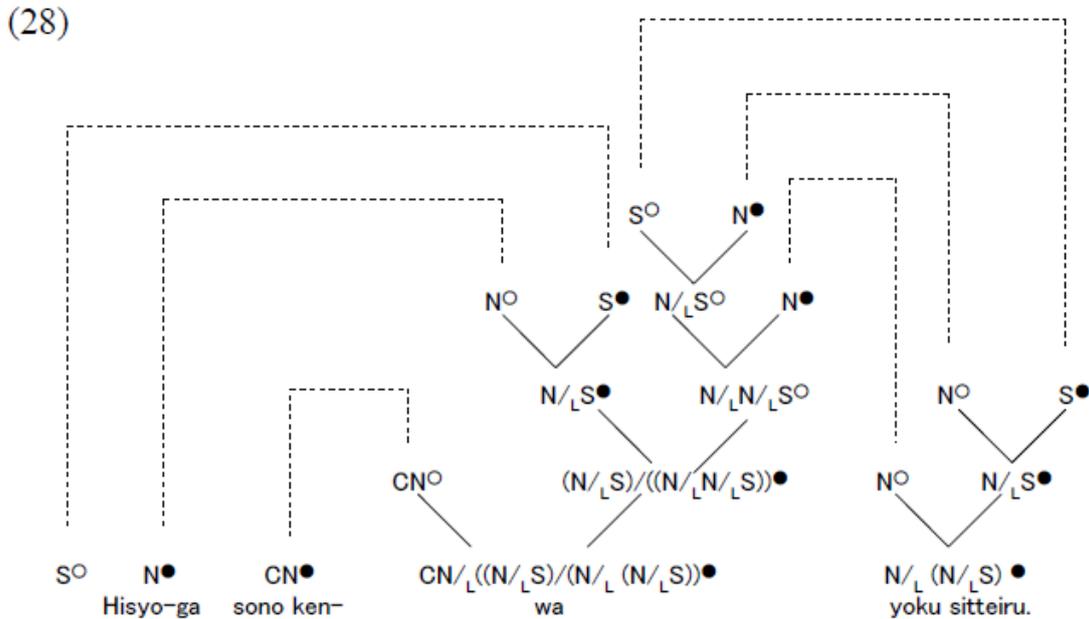

*Daijin-wa hisyo-ga sono\_ken-wa yoku sitteiru-to itta.*  
 minister-TOP secretary that issue-TOP well know said

'The minister said that his secretary knows that issue well (better than he).'

Because the old/familiar information includes the law-maker and that issue (bribery), and the other elements constitute new information in (26), the expressions conveying old and new information are intermixed with each other, which appears to make information packaging at surface structure level extremely difficult. The sentence-internal topic *sono ken-wa* does not seem to convey contrastive meaning which implies the existence other pieces of information he does not know. I just claim that given the flexible type raising and composition rules assumed in categorial grammars, we can derive an expected interpretation from parsing of this sentence. Due to the limit of space, I only present the derivation of the embedded clause.

In old Japanese, the accusative case marker was followed by the topic marker, yielding the complex form *-o-ba*, though the accusative marker is omitted in modern Japanese. Given the flexible use of type shifting in recent CCG, suppose that the accusative topic is raised to the functor taking two-place predicates as input to return one-place predicate as result. We show the derivation in a bit different presentation, hiring a proof-net approach recently developed by Morrill.

(27) *hisyo-ga sono ken-(o)-wa yoku sir-teiru-to ...*  
 N: (S\N)/((S\N)\N: V\*/V\* (S\N<sub>Sub</sub>)\N<sub>Obj</sub>  
 Secretary' that issue well know-Pres ...

Top x[*issue'*(x) → *knows'*(x)(*secretary'*)]

The proof net in (28) is automatically translated into its meaning indicated under the net, via semantic trip, which is omitted due to space limitations.

Actually, the topic-marked object must be in concord (or coherence) with the sentence-final matrix verb. Because the matrix subject and embedded object are marked as topic in (26), the derivation of the sentence with multiple topics is complicated, but from the semantic trip, we can get the semantic derivation like (29):

(29) TOP x[*minister'*(x) ⇒ (TOP y[*that\_issue'*(y) ⇒ *said'*(*knew\_well'*(y)(*secretary'*))(x)]]

Topic segment
Comment segment

In this section, we have dealt with the syntactic structures and semantic interpretations of a wide range of topicalized sentences in a parallel fashion maintaining the principle of (strong) compositionality by using the flexible combinatory operations. We argue that, even if the topic-comment segmentation is not manifested in surface strings, it should be encoded as the tripartite semantic structure automatically derivable from syntactic parsing if the proper category and type are assigned to the topic

expressions.

#### 4. Conclusion

In this paper, I attempted to show how sentences with topics of various categories can be translated into the meaning, in terms of the syntax-semantics interface. Following the standard assumption that topic phrases are associated with presupposition, we argued against the account based on the file-card metaphor, and the topic-as-entity theory, because Japanese topic-particle WA can follow a wide variety of expressions. Also we dismissed the comparative approach to the topic particle and case particles including the nominative marker, which has been the overwhelmingly dominant paradigm in the study of information structure in Japanese since Kuno (1973).

We adopted the hypothesis proposed in Japanese traditional grammar that the topic particle shows a kind of concord/coherence with sentence final predicates. Japanese traditional grammarians implicitly have argued for a version of information packaging, which we have explicitly formalized in this study, using a version of categorial grammar.

## Abstract

This paper attempts to demonstrate that scrambling in Japanese affects the interpretation of a sentence in an intricate way. Although, as widely held, scrambling does not affect truth conditions of a sentence or create an operator-variable construction (Saito 1989), it creates FOCUS. On the other hand, Japanese is endowed with a specific particle for topicalization, i.e., *-wa*, which creates LINK. Vallduví's (1992, 1995) thesis that information packaging of a sentence is represented at information structure (IS), independent of LF or SS, is adopted. However, his information packaging strategy is revised so that the mapping from syntactic constituent structure to IS will be consistent. Furthermore, some evidence from prosody reinforces the argument that scrambling is FOCUS-creating.

**Keywords:** scrambling, topicalization, information structure, downstep

## 1. Introduction

It has been widely held since Saito (1989) that scrambling in Japanese is "semantically vacuous" in the sense that it does not create an operator-variable construction unlike *wh*-movement in English because it exhibits total reconstruction at LF. It is rather obvious that scrambling is not the type of operation that affects truth conditions of a sentence. Hence, when (1a) in the base SOV order is true (1b) in the scrambled OSV order is also true, and vice versa.

- (1) a. John-ga banana-o tabe-ta (SOV: base order)  
      -nom       -acc eat-past  
      'John ate a/the banana.'  
      b. banana-o John-ga tabe-ta (OSV: scrambled order)  
          -acc       -nom eat-past

Furthermore, *banana* in (1b) can be topicalized with *-wa* as in (1c).<sup>i</sup>

- (1) c. banana-wa John-ga tabe-ta (O<sub>T</sub>SV: object topicalized)  
      -top       -nom eat-past  
      'As for the banana, John ate it.'

As long as *banana* in (1c) is taken as a thematic topic, not a contrastive topic, it must be

given in the discourse. Since Kuroda (1965) and Kuno (1973) a lot of Japanese grammatical literature has discussed discourse-functional differences between topicalized sentences with a *wa*-phrase and untopicalized sentences with a nominative *ga*-phrase. However, as far as we know, not much attention has been paid to the discourse-functional effect of scrambled sentences like (1b). As we will make clear shortly, although (1b) may be truth-conditionally indistinguishable from (1a) or (1c), it is still different from the others discourse-functionally.

The organization of this paper is as follows. Section 2 discusses discourse-functional effects of scrambling and topicalization in Japanese. We will show that the two operations, both being potentially word order changing, are in complete division of labor in information packaging in the sense of Vallduví (1992, 1995). Specifically, while topicalization is LINK-creating, scrambling is FOCUS-creating. In Section 3, we will point out some problems of Vallduví's information packaging strategy. Section 4 proposes an alternative set of strategies so that the mapping from syntactic structure (i.e. s-structure) and information structure (IS) will be transparent. Section 5 provides additional evidence from prosody that scrambling creates FOCUS. Finally, section 6 concludes the paper.

## 2. Scrambling, Topicalization and Information Structure

### 2.1 Discourse effects of scrambling and topicalization

As far as we know, Akizuki (1994) was the first to make it explicit that scrambling in Japanese has a discourse-functional effect. (2) is a *wh*-question where the subject is *wh*-interrogated in the SOV base order. Among the potentially possible answers to (2) in (3a~c), only (3a) and (3c) are felicitous.<sup>ii</sup>

- (2) dare-ga sono piza-o tabe-ta no? (SOV: base order)  
 who-nom that pizza-acc eat-past Q  
 'Who ate that pizza?'
- (3) a. Taro-ga sono piza-o tabe-masi-ta. (SOV: base order)  
       -nom that pizza-acc eat-pol-past  
       'John ate that pizza.'
- b. #sono piza-o Taro-ga t tabe-masi-ta. (OSV: object scrambled)  
           that pizza-acc -nom eat-pol-past  
           'That pizza, Taro ate t.'
- c. sono piza-wa Taro-ga e tabe-masi-ta. (O<sub>T</sub>SV: object topicalized)  
           that pizza-top -nom eat-pol-past  
           'That pizza, Taro ate (it).'

Among the three potential answers, (3a), which has the same SOV order as (2), is the most straightforward answer. Since the object *sono piza* 'that pizza' is given in (2), it can be topicalized as in (3c), and it is still felicitous. However, if the object is scrambled as in (3b), the result is not a felicitous answer to (2). This calls for a principled account.<sup>iii</sup>

## 2.2 Information packaging (Vallduví 1992, 1995)

Traditionally, the discourse-functional structure of a sentence like (4b) as an answer to (4a), where the object *the car* is focused, has been represented by binary partition of the sentence, that is, topic-comment (Li & Thompson 1976, Kuno 1980, Reinhart 1982, among others) or focus-presupposition (Chosmky 1971, Jackendoff 1972, Prince 1981, among others) as in table (5).

- (4) a. What did John fix?  
b. John fixed [<sub>F</sub> the CAR].

(5)

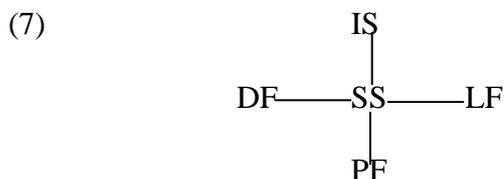

John	fixed	[ <sub>F</sub> the CAR]
topic	comment	
presupposition		focus

However, the information status of the verb *fixed* in (4b) is not clear under either way of binary representation in (5). Instead, Vallduví (1992, 1995) proposes that information packaging of a sentence undergoes ternary partition as shown in (6).

- (6) a. S = {FOCUS, GROUND}  
b. GROUND = {LINK, TAIL}  
(GROUND=presupposition, LINK=topic, TAIL=GROUND-LINK(=topic))

According to Vallduví, the information packaging of a sentence (=S) is implemented as indicated in (6a, b); S is first divided into FOCUS and GROUND, the latter of which corresponds to presupposition of focus-presupposition partition; GROUND is further divided into LINK and TAIL, the former of which corresponds to topic of topic-comment partition.

Vallduví further argues that information packaging of a sentence is represented at Information Structure (IS), which is independent of PF or LF, as schematized in (7).

In Vallduví's terms, (4b) is represented as in (8) at IS.<sup>iv</sup>

- (8) [<sub>G</sub> [<sub>L</sub> John] [<sub>T</sub> fixed]] [<sub>F</sub> the CAR]. (for (4b), G = S+V)

In (8), the verb *fixed* is given its information status as TAIL, which is part of GROUND. Note, however, that Vallduví's brace notion in (6) allows for GROUND in (8) to be a syntactic non-constituent. It should be a potential problem because such a non-constituency makes the mapping between SS and IS opaque. We will come back to this

issue in section 4.

### 2.3 Topic *-wa*, obligatory focus *-ga*, and information packaging

It has been generally agreed since Kuno (1973) that while the thematic topic with *-wa* as in (9b) is a given piece of information in the context, the nominative subject with a stative predicate as in (10b) is an obligatory focus (or "exhaustive listing" in Kuno's terms).

- (9) a. (Asking about Taro's occupation)  
Taro-wa nan(i) desu ka? / nani-o si-te-i-masu ka?  
-top what cop Q what-acc doing.pol Q  
'What is Taro?' or 'What is Taro doing?'
- b. Taro-wa KASYU desu. (Taro = topic)  
-top singer cop  
'Speaking about Taro, he is [F A SINGER].'
- (10) a. (Among the relevant set of individuals)  
dare-ga kasyu desu ka?  
who-nom singer cop Q  
'Who is a singer?'
- b. TARO-ga kasyu desu. (TARO = obligatory focus)  
-nom singer cop  
'It is [F TARO] who is a singer.'

Following Vallduví, we will take it that the information structures of (9b) and (10b) are represented as in (11a) and (11b), respectively.

- (11) a. [<sub>G=L</sub> Taro-wa] [<sub>F</sub> SINGER] (IS for (10b))  
b. [<sub>F</sub> TARO-ga] [<sub>G</sub> singer] (IS for (11b))

## 3. Scrambling and IS

### 3.1 Scrambling, topicalization and discourse felicity

As we have seen at the end of section 1, although scrambling does not alter truth conditions of a sentence, it has a discourse-functional effect. The question in (2), reproduced as (12), can be appropriately answered by (13a) and (13c), but not by (13b) where scrambling preposes part of the background information of the question, that is, the object *sono piza-o* 'that pizza-acc' in (12).

- (12) dare-ga sono piza-o tabe-ta no? (= (2), SOV: base order)  
who-nom that pizza-acc eat-past Q  
'Who ate that pizza?'

- (13) a. Taro-ga sono piza-o tabe-masi-ta. (= (3a), SOV: base order)  
 -nom that pizza-acc eat-pol-past  
 'John ate that pizza.'
- b. #sono piza-o Taro-ga t tabe-masi-ta. (= (3b), OSV: object scrambled)  
 that pizza-acc -nom eat-pol-past  
 'That pizza, Taro ate t.'
- c. sono piza-wa Taro-ga e tabe-masi-ta. (= (3c), O<sub>T</sub>SV: object topicalized)  
 that pizza-top -nom eat-pol-past  
 'That pizza, Taro ate (it).'

On the other hand, if the *wh*-interrogative phrase is scrambled as in (14), the answer in (15a), which has the same constituent order as in (13b), becomes felicitous.

- (14) nani-o Taro-ga t tabe-ta no? (OSV: object scrambled)  
 what-acc -nom eat-past Q  
 'What did John eat?'
- (15) a. sono piza-o Taro-(?)ga/wa t tabe-masi-ta. (OS<sub>(T)</sub>V: object scrambled)  
 that pizza-acc -nom/top eat-pol-past  
 'That pizza, Taro ate t.'
- b. #sono piza-wa Taro-ga e tabe-masi-ta. (O<sub>T</sub>SV: object topicalized)  
 that pizza-top -nom eat-pol-past  
 'That pizza, Taro ate (it).'
- c. Taro-wa sono piza-o tabe-masi-ta. (S<sub>T</sub>OV: subject topicalized)  
 -top that pizza-acc eat-pol-past  
 'Taro ate that pizza.'

Due to its givenness, the subject *Taro* can be topicalized as in (15c). As the infelicity of (15b) indicates, *sono piza* 'that pizza,' which should constitute focus, may not be topicalized.

### 3.2 Information packaging in Japanese

As for information packaging in Japanese, we will propose (16a, b).

- (16) Proposals
- a. Topicalization  
 A phrase suffixed with *-wa* that is base-generated in the sentence-initial position constitutes LINK.
- b. Scrambling  
 A phrase that is scrambled to the sentence-initial position constitutes FOCUS.

Under the proposals in (16), (13a~c) and (15a~c) can be represented as (17a~c) and (18a~c), respectively.

- (17) a. [<sub>F</sub> Taro-ga] [<sub>G</sub> sono piza-o tabe-masi-ta]. (for (13a))  
 -nom that pizza-acc eat-pol-past

- b. [<sub>F</sub>\* sono piza-o] [<sub>F</sub> Taro-ga] [<sub>G</sub> (t) tabe-masi-ta]. (for (13b))  
     that pizza-acc       -nom       eat-pol-past
- c. [<sub>L</sub> sono piza-wa] [<sub>F</sub> Taro-ga] [<sub>T</sub> tabe-masi-ta]. (for (13c))  
     that pizza-top       -nom       eat-pol-past
- (18) a. [<sub>F</sub> sono piza-o] [<sub>G</sub> [<sub>L</sub> Taro-wa] [<sub>T</sub> tabe-masi-ta]]. (for (15a))  
        that pizza-acc                   -top       eat-pol-past
- b. [<sub>L</sub>\* sono piza-wa] [<sub>G</sub> Taro-ga (pro) tabe-masi-ta]. (for (15b))  
     that pizza-top       -nom       eat-pol-past
- c. [<sub>L</sub> Taro-wa] [<sub>F</sub> sono piza-o] [<sub>T</sub> tabe-masi-ta]. (for (15c))  
     -top   that pizza-acc   eat-pol-past

As shown in (17b), *sono piza-o* 'that pizza-acc' in (13b), which should constitute part of GROUND, is focused by scrambling, hence, an infelicitous answer to (12). Conversely, as shown in (18b), *sono piza* in (15b) should be construed as FOCUS, but it is made to be LINK by topicalization. Thus, the infelicity of (13b) and (15b) can be explained away.

#### 4. The Mapping Relation between SS and IS

##### 4.1 Syntactic constituency and information packaging

Vallduvís (1992, 1995) information packaging of a sentence in (6), reproduced as (19), allows GROUND to be a syntactic non-constituent.

- (19) a. S = {FOCUS, GROUND}  
        b. GROUND = {LINK, TAIL}

In (20b) as an answer to the question in (20a), GROUND is composed of the subject and the verb, a non-constituent. (21b) as an answer to the question in (21a) has its GROUND composed of the subject and the object, again, a non-constituent.

- (20) a. What did John fix? (=(4a))  
        b. [<sub>G</sub> [<sub>L</sub> John] [<sub>T</sub> fixed]] [<sub>F</sub> the CAR]. (=(4b), G=S+V)
- (21) a. What did John do to the car?  
        b. [<sub>L</sub> John] [<sub>F</sub> FIXED] [<sub>T</sub> the car]. (G=S+O)

##### 4.2 Toward a solution

Before providing a solution to potentially problematic cases in English like (20b) and (21b), we must point out that Japanese has similar problematic cases. To begin with, we will make a set of assumptions in (22).

- (22) Assumptions (about Japanese) 1  
        a. A nominative subject stays *in situ*, i.e. [Spec, vP] (Kuroda 1988, Fukui &

Takano 1998).

- b. A topicalized phrases with *-wa* is base-generated in [Spec, TP], and it binds/controls *pro* within *vP* (Hoji 1985).
- c. The event argument functions as a default LINK in a sentence without a topic with *-wa* (Tomioka 2001, 2007).

With the set of assumptions in (22), our earlier examples in (13a~c) and (15a~c) can be given their syntactic and IS representations in a and b in (23)–(28), respectively. The infelicity of (13b) results from the fact that what should be part of GROUND is focused by scrambling as shown in (24b). On the other hand, the infelicity of (15b) comes from the fact that what should be focused is topicalized with *-wa* as shown in (27); as a result, (15b) is not informative at all without any focus.

- (23) a. [TP [vP Taro-ga [vP sono piza-o tabe-masi-ta]]]. (= (13a))  
           -nom that pizza-acc eat-pol-past  
       b. [L e] [F Taro-ga] [T sono piza-o tabe-masi-ta] (G=non-constituent)
- (24) a. [TP sono piza-o<sub>i</sub> [vP Taro-ga [vP t<sub>i</sub> tabe-masi-ta]]]. (= # (13b))  
           that pizza-acc -nom eat-pol-past  
       b. [F sono piza-o] [G Taro-ga tabe-masi-ta]
- (25) a. [TP sono piza<sub>i</sub>-wa [vP Taro-ga [vP pro<sub>i</sub> tabe-masi-ta]]]. (= (13c))  
           that pizza-top -nom eat-pol-past  
       b. [L sono piza-wa] [F Taro-ga] [T tabe-masi-ta] (G=non-constituent)
- (26) a. [TP sono piza-o<sub>i</sub> [vP Taro-ga [vP t<sub>i</sub> tabe-masi-ta]]]. (= (15a))  
           that pizza-acc -nom eat-pol-past  
       b. [F sono piza-o] [G Taro-ga tabe-masi-ta]
- (27) a. [TP sono piza<sub>i</sub>-wa [vP Taro-ga [vP pro<sub>i</sub> tabe-masi-ta]]]. (= # (15b))  
           that pizza-top -nom eat-pol-past  
       b. \*[G [L sono piza-wa] [T Taro-ga tabe-masi-ta]] (no focus)
- (28) a. [TP Taro-wa] [vP pro] [vP sono piza-o tabe-masi-ta]]. (= (15c))  
           -top that pizza-acc eat-pol-past  
       b. [L Taro-wa] [F sono piza-o] [T tabe-masi-ta]. (G=non-constituent)

Note, here, that even in the felicitous IS representations in (23b), (25b), and (28b), LINK and TAIL, subcomponents of GROUND, are not even string adjacent, let alone syntactic constituency.

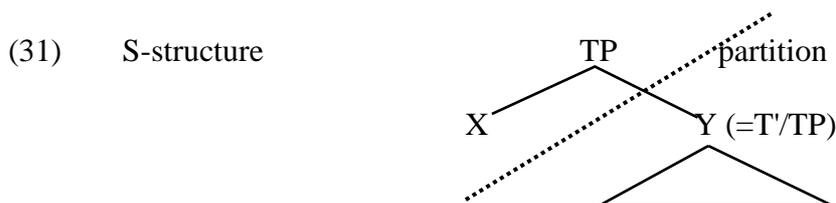

#### 4.3 A modification on Vallduvís information packaging

In order to overcome this potential problem, we propose a parenthetical notation (a, b) where a and b are in constituent with each other (linear order irrelevant, though), instead of Vallduvís set-theoretical brace notation {a, b}, as in (29) and (30).

- (29) a. S = (FOCUS, GROUND)  
 b. GROUND = (LINK, TAIL)

- (30) a. S = (LINK, COMMENT)  
 b. COMMENT = (FOCUS, TAIL)

Our proposal amounts to saying that TAIL can form an IS-constituent with FOCUS as well as LINK. Furthermore, we claim that the left-edge element is detached from the rest (a la Diesing 1992) during the mapping from SS to IS. If the detached element is FOCUS (e.g. a scrambled element in Japanese), the SS is mapped to the IS in (32a), but if it is LINK (e.g. a topic with *-wa* in Japanese), the IS will take the form in (32b).

- (32) Information packaging at IS  
 a. [F X] [G Y] (focus-prominent information packaging)  
 b. [L X] [C Y] (topic-prominent information packaging)

#### 4.4 Potentially problematic cases revisited

Given (29) and (30), all the potentially problematic cases in Japanese as well as in English that we have seen earlier may have an alternative IS representation.

- (33) a. SS: [TP sono piza<sub>i</sub>-wa [T [VP Taro-ga [VP pro<sub>i</sub> tabe-masi-ta]]]]. (= (13c))  
           that pizza-top                   -nom                   eat-pol-past  
 b. IS: [L sono piza-wa] [C [F Taro-ga] [T tabe-masi-ta]] (cf. (25b))
- (34) a. SS: [TP Taro-wa] [T [VP pro [VP sono piza-o tabe-masi-ta]]]]. (= (15c))  
           -top                                   that pizza-acc eat-pol-past  
 b. IS: [L Taro-wa] [C [F sono piza-o] [T tabe-masi-ta]] (cf. (28b))
- (35) a. SS: [TP John [T [VP fixed the CAR]]]. (= (20b))  
 b. IS: [L John] [C [T fixed] [F the CAR]]
- (36) a. SS: [TP John [T [VP FIXED the car]]]. (= (21b))  
 b. IS: [L John] [C [F FIXED] [T the car]]

As shown in each b- in (33)–(36), the noted potentially problematic cases can be taken for those in which FOCUS and TAIL form an IS-constituent, COMMENT, so that the mapping between SS and IS becomes transparent.

#### 4.5 WH-questions in Japanese and information packaging

It is widely observed (Tomioka 2007, among others) that wh-questions in

Japanese must have a topic unless the wh-interrogative itself is the subject as in our earlier example in (2=12). Consider (37a~c).

- (37) a. Taro-wa nani-o tabe-ta no?  
           -top what-acc eat-past Q  
           'What did Taro eat?'  
       b. #Taro-ga nani-o tabe-ta no?                   (as a non-echo question)  
           -nom what-acc eat-past Q  
       c. nani-o Taro-ga t tabe-ta no?  
           what-acc -nom eat-past Q

Since (37a) has a topic *Taro-wa*, it is a felicitous wh-question. On the other hand, since (37b) does not have a topic, it is not a felicitous non-echo wh-question. However, if the object wh-interrogative is scrambled across the nominative subject as in (37c), the sentence becomes a felicitous wh-question without a topic.

To account for the fact exhibited in (37a~c), we will make another set of assumptions in (38), both of which we believe to be innocuous.

- (38) Assumptions (about Japanese) 2  
       a. WH interrogatives constitute FOCUS at IS.  
       b. Only phrases with *-wa* may constitute LINK at IS.

(37a) and (37c) can be mapped to the felicitous ISs in (39a) and (39b) by information packaging in (30) and (29), respectively.

- (39) a. [L Taro-wa] [C [F nani-o] [T tabe-ta]] no?   (for (37a) by (30))  
           -top     what-acc eat-past Q  
           'What did Taro eat?'  
       b. [F nani-o] [G Taro-ga (t) tabe-ta] no?   (for (37c) by (29))

However, neither (29) nor (30) can derive a well-formed IS for (37b). Consider the two alternative ISs derived from (37b) in (40a, b).

- (40) a. \*[L Taro-ga] [C [F nani-o] [T tabe-ta]] no?   (for (37b) by (30))  
           -nom     what-acc eat-past Q  
           '(int.) What did Taro eat?'  
       b. \*[F Taro-ga] [G [F nani-o] [T tabe-ta]] no?   (for (37b) by (29))

(40a) is ruled out because a phrase without *-wa* (but with *-ga* 'nom' instead) constitutes LINK at IS. In (40b) a wh-phrase that should count as FOCUS is embedded in GROUND, which is not allowed.<sup>v vi</sup>

## 5. Evidence from prosody

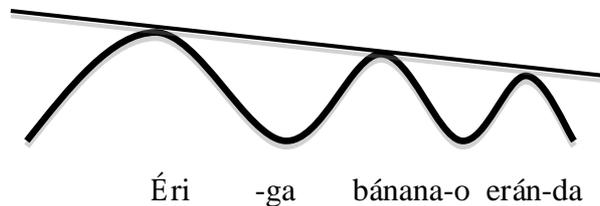

In this section, we will provide some prosodic evidence for our claim that scrambling creates FOCUS in terms of information packaging of a sentence in Japanese.

### 5.1 Downstep and thematic topic with *-wa* in Japanese

It has been widely known that Japanese exhibits downstep (DS), “a change in pitch register which is manifested as a marked lowering in the stretch of an utterance following an accented syllable” (Selkirk and Tateishi 1991: 519). Hence, (41a), all three major constituents of which are accented, has a schematic pitch contour as indicated in (42).

- (41) Éri-ga bánana-o erán-da.  
 -nom banana-acc choose-past  
 ‘Eri chose a banana.’

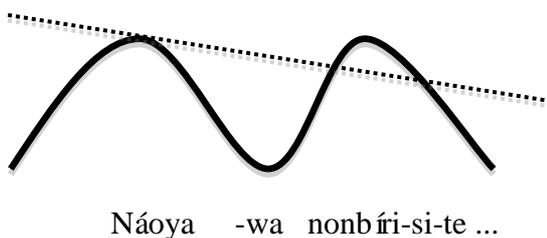

- (42) DS

However, based on her own experiment, Nakanishi (2002, 2006) reports that DS does not take place after thematic topic. The result of the experiment that Nakanishi has conducted shows that her example sentence in (43) has the schematic pitch contour in (44).

- (43) Náoya-wa nonb íri-si-te i-más-u                      (Nakanishi 2002: 439)  
 -top    relax-do-prog-pol-pres  
 ‘Naoya is relaxing.’

- (44) No DS

According to Nakanishi, this is because thematic topic with *-wa* is separated from the rest of the sentence by a major (prosodic) phrase (MPP) boundary, where a MPP is the domain to which DS applies.

Nakanishi’s (2002, 2006) claim can be interpreted in the way exhibited in (45).

- (45) a. step 1: [MPP Naoya-wa] nonbiri-si-te ...  
 b. step 2: [MPP Naoya-wa] [MPP nonbiri-si-te ...]

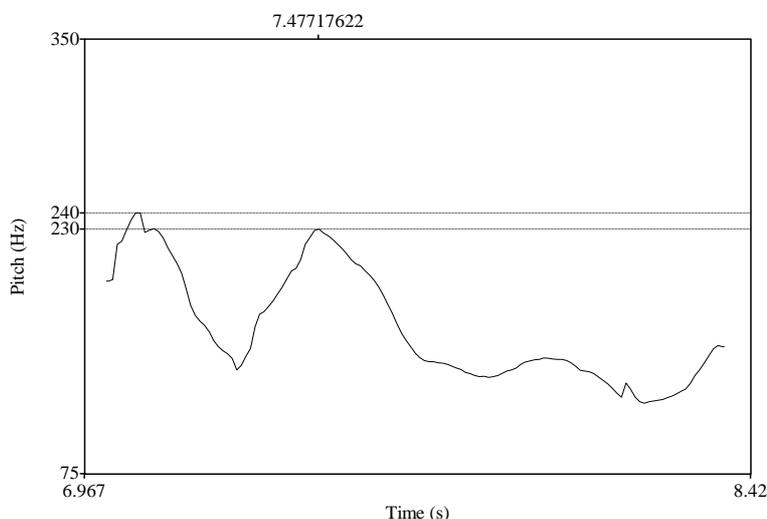

Since *Naoya-wa* is a thematic topic, it constitutes a MPP on its own (step 1). As a result, the rest of the sentence constitutes another MPP (step 2). Because a MPP is the domain to which DS applies, no DS effect is observed after *Naoya-wa*.<sup>vii</sup>

## 5.2 Our experiment and its results

Since we are more concerned with discourse-functional effect of scrambling, we have conducted our own experimental study on prosody in which we have compared scrambled and unscrambled sentences. In this study, each of the four subjects (all of whom are non-linguist speakers of Tokyo dialect) was given a set of wh-questions as cues and asked to read their answers. In (46)–(50), each a-sentence is given as a cue, the corresponding b-sentence is its answer, and the pitch contours of the b-utterances are given in Charts 1–5.<sup>viii</sup>

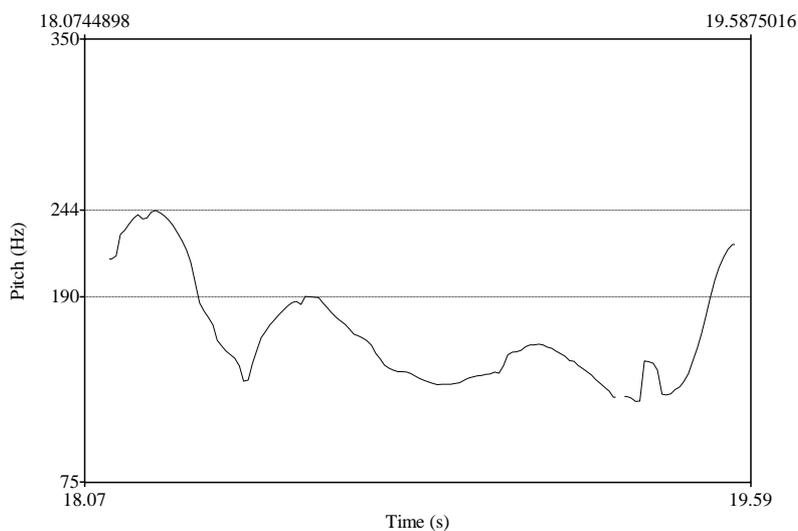

- (46) a. Eri-wa nani-o eran-da no? (S<sub>T</sub>OV: S topicalized)  
 -top what-acc choose-past Q  
 ‘What did Eri choose?’  
 b. Éri-wa bánana-o erán-da yo (S<sub>T</sub>OV: S topicalized)  
 -top banana-acc choose-past SFP (SFP=sentence-final particle)  
 ‘Eri chose [F A BANANA].’

Chart 1 (YM’s utterance of (46b)): No DS observed

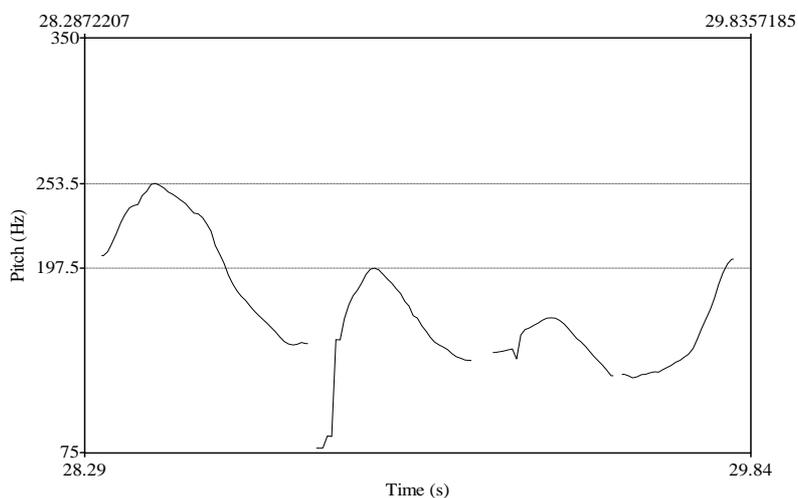

- (47) a. Dare-ga banana-o eran-da no? (SOV: base order)  
 who-nom banana-acc choose-past Q  
 ‘Who chose a banana?’  
 b. [F ÉRI-ga] bánana-o erán-da yo (SOV: base order)  
 -nom banana-acc choose-past SFP  
 ‘[F Eri] chose a banana.’

Chart 2 (YM's utterance of (47b)): DS observed

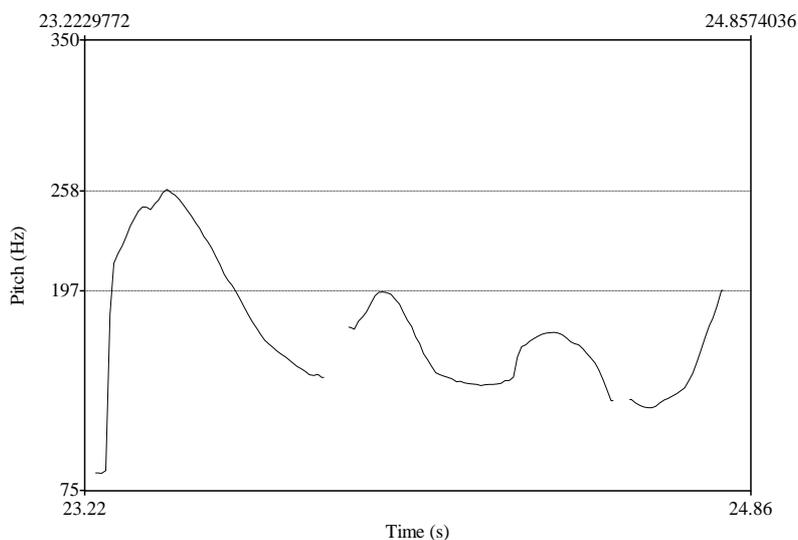

- (48) a. Eri-wa nani-o eran-da no? (S<sub>T</sub>OV: S topicalized)  
 -top what-acc choose-past Q  
 ‘What did Eri choose?’  
 b. bánana-o Éri-wa erán-da yo (OS<sub>T</sub>V: O scrambled)  
 banana-acc -top choose-past SFP  
 ‘[F A BANANA] Eri chose.’

Chart 3 (YM's utterance of (48b)): DS observed

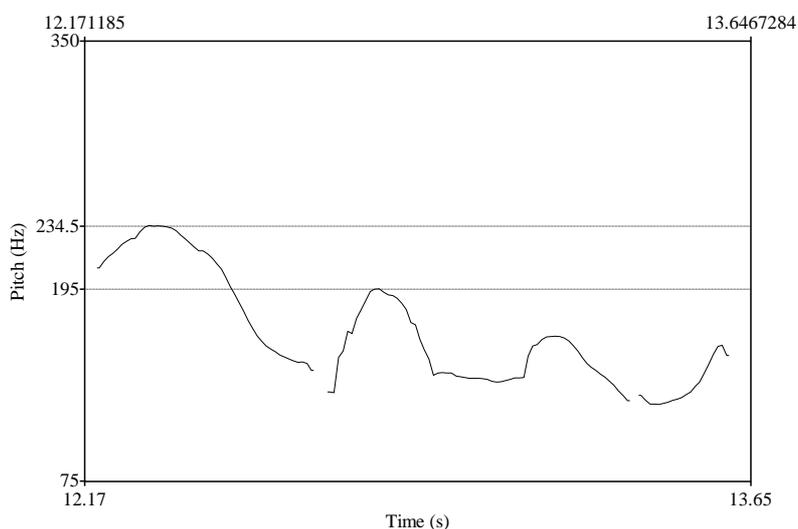

- (49) a. nani-o Eri-wa eran-da no? (OS<sub>T</sub>V: O scrambled,  
 what-acc -top choose-past Q S topicalized)  
 ‘What did Eri choose?’  
 b. bánana-o Éri-wa erán-da yo (OS<sub>T</sub>V: O scrambled,  
 banana-acc -top choose-past SFP S topicalized)  
 ‘[F A BANANA] Eri chose.’

Chart 4 (YM's utterance of (49b)): DS observed

- (50) a. nani-o Eri-ga eran-da no? (OSV: O scrambled)  
 what-acc -nom choose-past Q  
 ‘What did Eri choose?’
- b. b nana-o  ri-ga er n-da yo (OSV: O scrambled)  
 banana-acc -nom choose-past SFP  
 ‘[F A BANANA] Eri chose.’

Chart 5 (YM's utterance of (46b)): DS observed

As for the sentence-initial thematic topic in (46b), our result is similar to Nakanishi's (2002, 2006); namely, no remarkable DS effect is observed after the topic (see Chart 1); (46b) shows a sharp contrast, in that an obvious DS effect is observed after the sentence-initial nominative (focused) phrase (see Chart 2). However, (48b) and (49b), where the object is scrambled across a thematic topic (i.e., OS<sub>T</sub>V), exhibit a DS effect after the topic as well as after the scrambled object (see Charts 3 and 4). Furthermore,

the pitch contour of (50b), where the object is scrambled across the nominative subject (i.e., OSV), looks similar to those of (48b) and (49b) (compare Chart 5 with Charts 3 and 4).

What is noteworthy of the test results above is the fact that the sentence-initial scrambled phrase always exhibits the highest pitch peak, and DS applies towards the end of the sentence, as shown in Charts 3–5.<sup>ix</sup> Furthermore, this tendency is not altered whether scrambling takes place across a topic or a nominative phrase. Note further that this pattern is not affected whether the cue sentence is given in the base SOV order as in (48) or in the scrambled OSV order as in (49). Now we are concerned with how to interpret these facts.

According to Nagahara (2003), focus is one major factor that defines a MPP (which corresponds to Nagahara’s “Intermediate Phrase”) to which DS applies, and a focused element always appears on the left edge of a MPP. Given this, there are potentially two alternative explanations for the absence of DS in the case of (46b), repeated as (51) below (also see Chart 1 above).

- (51) [L Éri-wa] [F b nana-o] er n-da yo (=46b)  
           -top      banana-acc choose-past SFP  
           ‘Eri chose [F A BANANA].’

One way is to go with Nakanishi (2002, 2006) in the following way.

- (52) a. step 1: [MPP [L Eri-wa]] banana-o eran-da yo  
        b. step 2: [MPP [L Eri-wa]] [MPP banana-o eran-da yo]

Since the thematic topic *Eri-wa* constitutes a MPP on its own, it is set off from the rest of the sentence (step 1 in (52a)), and as a result, the rest of the sentence counts as another MPP (step 2 in (52b)). Another possibility, which we would like to pursue, is that, first, the focus *banana-o* defines a MPP so that it will appear on its left edge (step 1 in (53a)), and resultantly, the sentence-initial thematic topic constitutes another MPP (step 2 in (53b)).

- (53) a. step 1: Eri-wa [MPP [F banana-o] eran-da yo]  
        b. step 2: [MPP Eri-wa] [MPP [F banana-o] eran-da yo]

As far as (51) is concerned, the choice between the two is immaterial. However, cases like (48b) and (49b), repeated as (54) below, seem to provide a touch stone.

- (54) [F b nana-o] [L  ri-wa] er n-da yo (=48b)/(49b)  
           banana-acc      -top choose-past SFP  
           ‘[F A BANANA] Eri chose.’

If the thematic topic *Eri-wa* constitutes a MPP alone, as suggested by Nakanishi (2002, 2006), there will be three independent MPPs, as indicated in (55).

- (55) a. step 1: banana-o [MPP [L  ri-wa]] er n-da yo  
        b. step 2: [MPP banana-o] [MPP [L Eri-wa]] [MPP eran-da yo]

As indicated in (55a), the thematic topic *Eri-wa* constitutes a MPP on its own, and consequently, as indicated in (55b), each of the scrambled object and the predicate part of the sentence will independently constitute a MPP. Since the three major constituents are separated by a MPP boundary from each other, no DS effect should be expected, contrary to fact (see Charts 3 and 4). Contrarily, if the sentence-initial scrambled phrase defines a MPP but the thematic topic does not, the whole sentence counts as one MPP, as indicated in (56).

(56) step 1: [MPP [F banana-o] Eri-wa eran-da yo]  
no step 2

This provides the correct result. This is because a DS effect is remarkable in (50b) as well as in (48b) and (49b) (compare Chart 5 with Charts 3 and 4). In other words, whether the subject, across which the object is scrambled, is topicalized or not does not count.

Now we can provide an alternative account for Nakanishi's (2002, 2006) test sentence in (43), repeated as (57) below.

(57) [L Náoya-wa] [F nonb íri-si-te] i-más-u (=43)  
-top relax-do-prog-pol-pres  
'Naoya is relaxing.'

In our terms, focus, but not thematic topic, defines a MPP on its own. In (57), *nonbiri-si-te* 'be relaxing' is most naturally interpreted as focus. Hence, this part of the predicate defines a MPP so that it will appear on its left edge as indicated in step 1 in (58a).

(58) a. step 1: Náoya-wa [MPP [F nonb íri-si-te] i-más-u]  
b. step 2: [MPP Náoya-wa] [MPP [F nonb íri-si-te] i-más-u]

Consequently, the rest of the sentence (i.e., the sentence-initial topic) is made to constitute another MPP as shown in step 2 in (58b). Hence, no DS effect arises across the two MPPs.<sup>x</sup>

In this section, we have provided some evidence from prosody that scrambling creates FOCUS. As suggested by Nagahara (2003), FOCUS defines a MPP, to which DS applies, and it always appears on the left edge of a MPP. Given this, the fact that a scrambled sentence (i.e., OSV) constitutes only one MPP provides a support for our contention that scrambling is FOCUS-creating.

## 6. Concluding Remarks

In this paper, we have argued that scrambling is discourse-functionally non-vacuous in the sense that it creates FOCUS. Assuming with Vallduví (1992, 1995) that information packaging (IP) of a sentence is represented at IS, which is independent of LF, we have revised his IP strategy so that the mapping from the syntactic constituent structure to IS will be transparent. Furthermore, we have drawn a piece of evidence

from prosody to the effect that since scrambling creates FOCUS, the sentence-initial scrambled phrase makes the whole sentence one MPP, to which DS applies.

We have not been able to discuss other intriguing features of scrambling due to space limitation. One of such features is the definiteness/specificity effect, as pointed out in the literature.<sup>xi</sup> However, FOCUS can be either definite/specific or indefinite/non-specific. We must leave it for future research to scrutinize whether those properties of scrambling are correlated, and if so, how.

---

## Notes

\* This is a revised version of the paper presented at the Workshop on Information Structure of CIL18 at Korea University on July 22, 2008. We would like to thank the audience there. Especially, we have benefited from questions and comments provided by Minori Kurahashi, Chungmin Lee, Shigeru Miyagawa, Seungho Nam, Satoshi Tomioka, and Reiko Vermeulen. The usual disclaimer applies. The research reported here has been partially supported by Pache Research Grant I-A-2 from Nanzan University.

<sup>i</sup> In what follows, the subject and object topicalized with *-wa* is indicated by  $S_T$  and  $O_T$ , respectively.

<sup>ii</sup> Henceforth, while ungrammaticality will be indicated by the common star notion \*, discourse infelicity by #.

<sup>iii</sup> Since Japanese tends to keep the given/backgrounded information silent, the following (ia, b) are even more natural answers to (2).

- (i) a. Taro des-u.  
cop-pres  
'It is Taro (who ate a banana).'
- b. Taro-ga pro tabe-masi-ta.  
-nom eat-pol-past  
'Taro ate (it).'

However, Japanese speakers can unanimously tell that while (3a) and (3c), though a bit wordy, are felicitous answers to (2), (3b) is not.

<sup>iv</sup> Henceforth, F = FOCUS, G = GROUND, L = LINK, and T = TAIL.

<sup>v</sup> In fact it is a matter of controversy whether the awkwardness of (37b) results from a violation of a core grammatical (i.e., either syntactic or semantic) principle or from a pragmatic/IS factor. In the text we are pursuing the latter possibility mainly because it is after all a root phenomenon. Contrast (37b) with (i), where the whole sentence is embedded under a verb of saying, which is perfectly grammatical/felicitous.

- (i) [Taro-ga nani-o tabe-ta ka] osiete  
-nom what-acc eat-past Q tell.me  
'Tell me what Taro ate.'

Tomikoka (2007), independently, assuming that the nominative subject in the root clause as in (37b) is obligatory focus, makes a claim that such a nominative subject renders an intervention effect that blocks the Q-marker from being associated with the *wh*-interrogative phrase in object position. Although a full evaluation of Tomioka's claim is beyond the scope of the present paper, it must be noted that the nominative subject with an episodic predicate (or a stage-level predicate in the sense of Kratzer 1989) like *tabe-ta* 'eat-past' need not be obligatory focus, and it can be neutral description in the sense of Kuno (1973); hence, it can be part of FOCUS. This is confirmed by the fact that (ii), an all-focus sentence, can be uttered in an out-of-the-blue context.

- (ii) Hora, Taro-ga banana-o tabe-ta!

---

look            -nom            -acc eat-past  
'Look, Taro has eaten a banana!'

For Tomioka, a question remains as to why *Taro* in (37b) must be taken as obligatory focus but that in (ii) need not.

<sup>vi</sup> Despite the revision of Vallduvi's information packaging, there remain problematic cases. For instance, consider the following question-answer pairs from English and Japanese, respectively.

- (i) a. What happens to the dishes? (Erteschik-Shir 2007: 28)  
b. John washed the dishes.
- (ii) a. Taro-wa Hanako-ni nani-o age-ta no?  
-top -dat what-acc give-past Q  
'What did Taro give to Hanako?'  
b. Taro-wa Hanako-ni banana-o age-ta.  
-top -dat -acc give-past  
'Taro gave a banana to Hanako.'

The IS of (ib) and (iib) should look like (iiia) and (iiib), respectively.

- (iii) a. [<sub>F</sub> John washed] [<sub>L</sub> the dishes]  
b. [<sub>L</sub> Taro-wa] [<sub>G</sub> Hanako-ni [<sub>F</sub> banana-o] age-ta]

Neither seems to conform to the revised information packaging strategies in (29) and (30).

Although a disheseful scrutiny is necessary for such cases, we tentatively suggest the possibility that the object in (ib) is right-node raised, and the direct object in (iib) remains in the lower VP-shell after V raises to the higher V position, as indicated in (iva, b), respectively.

- (iv) a. [<sub>S</sub> [<sub>S</sub> John washed t] the dishes]  
b. [<sub>S</sub> Taro-wa [<sub>VP</sub> Hanako-ni [<sub>VP</sub> banana-o t] age+V<sub>ø</sub>] ta]

If these analyses are tenable, the following IS representations will be possible.

- (v) a. [<sub>C=F</sub> John washed (t)] [<sub>L</sub> the dishes]  
b. [<sub>L</sub> Taro-wa] [<sub>C</sub> Hanako-ni [<sub>F</sub> banana-o (t)] age-ta]

In the mapping from (iva) to (va), the right-node raised (i.e. S-adjoined) constituent, *the dishes*, constitutes LINK, and the rest of the sentence COMMENT. In (vb) mapped from (ivb), the lower VP shell with the trace of the raised V constitutes FOCUS. We would like to thank Satoshi Tomioka for drawing our attention to cases like (ii).

<sup>vii</sup> Based on our own experiment, we will propose an alternative account of the absence of DS after thematic topic in the following subsection.

<sup>viii</sup> For the sake of consistency, we will present the pitch contours of one subject (i.e. YM) throughout. However, the other subjects have shown the same tendency.

<sup>ix</sup> This result is orthogonal to Ishihara's (2000).

<sup>x</sup> For the sake of fairness, it should be noted that Nakanishi (2002, 2006) is concerned with the discrepancy in prosody between thematic topic and contrastive topic, not with scrambling.

# Contrastive topic marking in Gbe

Ines Fiedler

Humboldt University of Berlin  
Unter den Linden 6, 10099 Berlin, Germany  
ines.fiedler@staff.hu-berlin.de

## Abstract

The paper investigates the marking of contrastive topics in Gbe (Kwa). Gbe languages dispose of a marked topic construction which is used to mark different types of topics, such as new and inactive topics as well as contrastive topics. This marked topic construction is characterized by the left-dislocation of the topic constituent, the pronominal resumption of it in the comment part of the sentence and the optional use of a morphological marker. It will be shown that contrastive topics are marked differently from other topics in Gbe and that the contrastive reading is not only an effect of the context.

**Keywords:** contrastive topic, left-dislocation, pronominal resumption, additive particle

## 0. Introduction

This paper aims at presenting the various possibilities of expressing contrastive sentence topics in Gbe languages. In particular, we want to examine whether contrastive topics in Gbe are distinguished from aboutness topics by any overt grammatical marking.

We adopt the definition of topic in the sense of pragmatic aboutness: the topic of a sentence represents that “expression whose referent the sentence is about.” (Reinhardt 1982: 5). Cross-linguistically, this function is by default taken over by the grammatical subject of categorical sentences (cf. Givón 2001, Sasse 2006, Lambrecht 1994, *inter alia*). Contrastive topics are understood as a special kind of these aboutness topics (cf. Krifka 1999, 2007). In addition to the property of pragmatic aboutness, they imply a contrastive relation between the entity they represent and another item on a scalar set of alternatives. From this follows that contrastive topics are often regarded as a combination of topic and focus (Krifka 2007, Molnár 1998), or, as Krifka points out: “They consist of an aboutness topic that contains a focus.” (Krifka 2007: 44), compare the following example:

- (1) A: What do your siblings do?  
B: [My [SISter]<sub>Focus</sub>]<sub>Topic</sub> [studies MEDicine]<sub>Focus</sub>,  
and [my [BROther]<sub>Focus</sub>]<sub>Topic</sub> is [working on a FREIGHT ship]<sub>Focus</sub>  
(English, Krifka 2007: 44)

Different from this assumption, Molnár (2002) distinguishes the notion of contrast clearly from the notions of focus and topic, and considers it as a “linguistically relevant phenomenon” (2002: 147). She discusses as main criteria for the classification of contrast the existence of highlighting, (or, as Bolinger has described it, “every semantic peak is linked to contrastiveness”, Bolinger 1961) and the necessity of a membership in a set, which is often restricted to a closed set of alternatives (Halliday 1967, Chafe 1976, among others). The last point corresponds to the one mentioned by Krifka (2007) and is sometimes further strengthened in demanding “that the candidates excluded must be explicitly mentioned in the context” (Jacobs 1988: 113, in Molnár 2002: 149).

Resting on this claim that contrast is an independent phenomenon of information structure, Molnár (2002) argues “(i) that contrast in many languages can be optionally marked or even *must* be marked by grammatical means, and (ii) that certain formal (syntactic, morphological and phonological) phenomena can only be explained with recourse to the notion of contrast.” (Molnár 2002: 150f.).

Whether this statement can be maintained cross-linguistically, we will investigate in this paper. In general, contrastive topics are often correlated with special constructions like left-dislocation, Y-movement and others (cf. the notion of marked topic constructions in Givón 2001: 253 ff.). These marked topic constructions share, among other things, the following features:

1. The topic takes clause-initial position, thus responding to the cognitively-based principle of word order that demands that “The more important referent is placed first.” (Givón 2001: 270) and
2. The constructions often display a special prosodic pattern which distinguishes them from other kinds of topics. In English, contrastive topics are characterized by the so-called B-accent, and in German, they trigger a rising contour (*hat pattern*) of sentence intonation (Féry 1993). The B-accent in English is exemplified by the well-known Jackendoff example in (2). Here, the accent on *Fred* implies that there were other people at the party who ate other food. The A-accent on *beans* in the answer, on the other hand, represents the focal information.

- (2) A: Well, what about FRED? What did HE eat?  
B: FRED<sub>B</sub> ate the BEANS<sub>A</sub>.

(English, Jackendoff 1972)

In Korean, too, prosodic means are used to highlight contrastive topic constructions: they are marked by an especially high pitch on the topic marker (Lee 2007).

That prosody is a necessary requirement to distinguish Japanese contrastive topics from other noun phrases marked by *wa* was shown by Vermeulen (2007). According to her, contrastive topics in Japanese are characterized, besides occupying the left-

peripheral position in a sentence and being marked by *wa*, by a heavy stress (2007: 186f.).

- (3) A: What did John eat at the party yesterday?  
B: Well, I don't know about John, but  
*BILL-WA 8-zi-goro MAME-O tabeteita (yo)*  
Bill-nom 8 o'clock beans-acc eating particle  
'As for Bill, he was eating beans around 8 o'clock.'  
(Japanese, Vermeulen 2007: 187)

That means that there is no one-to-one relation between the marking of the noun phrase with the so-called topic marker *wa* and a contrastive reading (cf. Molnár 1998). Only when additionally stressed, the interpretation as contrastive topic is justified. Similarly, for other languages it was described that marked topic constructions fulfill a number of different functions: they mark aboutness topics, they are used to activate a formerly unused topic (topic promotion), with these construction a new or unexpected topic is introduced (topic shift) and they also identify contrastive topics (cf. Reinhart 1982: 10, Lambrecht 1994, Givón 2001).

The paper will therefore investigate the question whether there exist syntactic and/or morphological devices in Gbe that turn marked topic constructions into contrastive topics, as Molnár argues, or whether it is only the context, i.e. the explicit mentioning of alternatives in the linguistic context, what allows for an interpretation as contrastive topic. Gbe as a tone language does not use intonation to the same extent for the structuring of information as intonation languages do. Rather, it uses special syntactic as well as morphological devices for expressing marked topic constructions, as will be shown.

The paper is structured as follows: in the first section, the general characteristics of marked topic constructions (MTC) in Gbe will be presented, including their functions. The second section deals with special features of MTC with respect to their contribution to a contrastive reading. It will be argued that contrastive topics are indeed marked differently from other topics, namely by the use of a special resumptive pronoun, at least for the third person singular, and by the marking via the additive particle.

## **1. Marked topic constructions in Gbe**

### *1.1 Formal characteristics of marked topic constructions*

Before presenting the characteristics of marked topic constructions in Gbe, the languages under discussion shall be introduced. Gbe is the name for a group of closely related Kwa languages, or dialects, spoken in the coastal part of Nigeria, Benin, Togo

and Ghana<sup>1</sup>. Gbe languages are tone languages with two distinctive tones which serve mainly to express contrast on the lexical meaning of words. The word order in Gbe is relatively strict, insofar as the subject always precedes the verb. Object and adjunct follow the verb in canonical sentences; in marked topic or focus constructions, they take clause-initial position. There is no case marking.

Marked topic constructions in Gbe constitute a special syntactic configuration where the topic referent, in most of the cases a full noun phrase, is left-dislocated, i.e. it occupies an autonomous position left to the of the clause. The semantic role and the syntactic status of the referent are indicated within the comment by a resumptive pronoun. Additionally, it is possible to further mark the left-dislocated element, be it a noun phrase or an adverbial phrase, by a morphological marker. We assume that apart from phrasing effects indicated by a pause after the left-dislocated phrase, no further intonational features accompany this construction.

Example (4) illustrates the different strategies Gbe languages use to mark topics, here exemplified for Aja. The context is given by a picture set of three young men labelled with their proper names <<Thomas, William, Samuel>>. One of them is supposed to have a pet, therefore the question: *Does Thomas have a cat?* The speaker decided to give a complete answer, thus contrasting the three young men already introduced in the common ground. In the first part of the answer (4a), *Thomas* as the grammatical subject of the clause is understood as unmarked aboutness topic, as it was Thomas it was asked about. (4b) and (4c) represent instances of marked topic constructions: in both, the topical noun phrase is in sentence-initial position. Furthermore, they are marked by means of special morphemes, i.e. by *ɔ* in (4b), and by the particle *cán* in (4c), which follow the topic constituent. Additionally, the two topic constituents are resumed by the absolute pronoun *yè* in their canonical subject position since the clitic pronoun *é* is not allowed in this context.

(4) Context: Does Thomas have a cat?

a. *óò, tòmá dọ zìnbàtó,*

no, Thomas have hare  
'No, Thomas has a hare,

b. *wilyám ɔ kpó yé dé dọ nídé ò,*  
William TP NEG 3sg.emph NEG have thing.INDEF NEG  
William, he has nothing,

c. *Sámùél cán kpó yé dé dọ nídé ò.*  
Samuel also NEG 3sg.emph NEG have thing.INDEF NEG  
and Samuel has nothing, either.'

---

<sup>1</sup> Most of the data presented here represent Aja as spoken in Lalo, Benin, and were elicited during field research within the last years.

It is possible that marked topic constructions come together with marked focus constructions in one and the same sentence, as exemplified in (5) in the order topic before focus. On the other hand, multiple foci, i.e. structures implying the focus marker, and multiple marked topic constructions are not allowed to occur in Gbe.

- (5) *Sétù yà àkwékwè wè é d̀̀.*  
 Setu TP banana FM 3sg eat  
 ‘As for Setu, he ate BANANA.’

(Gun, Aboh 2003: 5)

For Ewe, Ameka (to appear) even described the combination of a frame topic, a focused element and a contrastive topic in a sentence, only possible in this order.

- (6) *le nyatef́e me lá, dzódagbe-é nye ya me-vá.*  
 LOC truth.contain.region TP, Monday-FOC 1sg as.for 1sg-come  
 ‘In truth, MONDAY I (in contrast to some others) came.’

(Ewe, Ameka, to appear: 3)

As the two examples have shown, Gbe languages differ with respect to the linear order of the marked topic and focus constructions in a sentence. It is still a matter of future research to investigate the exact conditions for the ordering of these elements in the clause. What is obvious is the fact that each marked construction is only attested once in the sentence, with the exception of frame setting topics.

## 1.2 Functions of marked topic constructions

In Gbe languages as well, the range of uses of marked topic constructions is not restricted to contrastive topics. Rather, they serve to mark non-prototypical or unactive topics as such (topic promotion).

### 1.2.1 Marking of the object as topic

First, these structures are used to mark non-subjects, even when they are referential, as topic. As mentioned before, in a categorical utterance the topic function is by default taken over by the grammatical subject, whereas the object holds the default focus position and is therefore interpreted as focal information. To avoid this default interpretation of the object as focal, it is fronted to the left periphery of the sentence. Additionally, the subject can be marked as focal, as demonstrated in example (7). Please note that the object is resumed as clitic pronoun *̀̀* cliticized to the verb. In this sentence, no contrast is involved; ‘that dish’ refers to the same referent in the real world as ‘lamb curry’ and no other dishes are mentioned.

(7) What about the lamb curry?

*nùdùdù cé mámányè yí dĕ. [dà-i]*  
 meal DEM grandmother.1sg FM prepare.3sg  
 ‘That dish was cooked by my grandmother.’

### 1.2.2 Introduction of new topics

We find marked topic constructions also at the beginning of a fairy tale, as in (8), in order to introduce the two main protagonists, the dog and the duck. With this sentence, the existence of the two referents is uttered and at the same time it is stated, that they were close friends. Both referents are represented by bare nouns because they were not yet active in the discourse, i.e. they have to be interpreted as indefinite. In the comment part of the sentence ‘they were good friends’, they are represented by the pronoun *wo* which is used as clitic as well as as emphatic pronoun (cf. Tchitchi 1984). There are no other animals active in the discourse, i.e. there is no overt contrast with other elements.

(8) *wō vá lí kékékéké,*  
 3pl PRT exist longtime  
*àvù kóqó kpàkpàxú ó, èxlò wó nyí.*  
 dog and duck TP, friend 3pl be  
 ‘In former time, as for a dog and a duck, they were good friends.’

### 1.2.3 Expression of contrastive topics

Example (9) is settled in the context of a narration about the preparations concerning the wedding of the speaker. All children of the speaker were active in the preparations and are now in a sort of parallel listing presented with their activity. The definite article in the third sentence part is not referring to the proper name, but to the noun ‘boy’.

(9) Context: All children have participated in the preparation of the wedding ceremony.

- a. *Àsíbá ó, yě wà yòyòwèmá,*  
 A. TP 3sg.emph do call.REDUPL.letter
- b. *Kósúá ó, yě dā ènú,*  
 K. TP 3sg.emph cook thing,
- c. *yí òsúvì, Kòkú, ló ó, yě drá téxwē ló dó.*  
 CNJ boy Koku DEF TP 3sg.emph repair place DEF repair

When an object referent is marked as topic in such a construction, the same distribution of clitic and emphatic pronoun can be observed, cf. example (7), where the topical object was resumed by a clitic pronoun with example (12). In the latter, we come across both types of pronouns: the clitic one occurs in the first contrastive part (b), whereas in the second and final contrastive part (c) the emphatic one has to be used obligatorily for expressing the contrast with the alternatives mentioned previously.

(12) Context: We have visited Paris. There, a lot of nice houses can be found.

a. *Mìwó ñkónótó drê nó mì mó*  
 1pl.poss guide explain for 1pl que

b. *àxwé cé ó, Le Corbusier yí cúì,*  
 house DEM TP, Le Corbusier FM build.3sg

c. *ècē ó, Jean Nouvel yí cú yě.*  
 DEM TP, Jean Nouvel FM build 3sg

‘Notre guide explained us that this house was built by Le Corbusier and that one by Jean Nouvel.’

Therefore it seems that in Aja, contrast is expressed by the use of the emphatic pronoun which indicates contrast to an entity mentioned earlier in the discourse.

Example (13) introduces a sentence where the emphatic pronoun is present on the site of the external topic expression, too, together with a noun phrase referring to the same entity. It is even possible to find the emphatic pronoun alone as left-dislocated topic expression. From this could follow that the emphatic pronoun was first used as external topic expression and was only later on introduced in the comment part of the utterance in order to express contrast unambiguously.

(13) (after watching half of a film) What do you think will happen?

*kpáví dèkà tó yí jī ó sá,*  
 fish one sort CNJ do PROG walk

*èlán dèkà yé ó shivé cí kó yē, ...*  
 animal one 3sg TP, hunger disturb PROG 3sg

‘A fish is going for a walk. And an animal is hungry. ...’

However, as example (14) documents the use of the pronoun in conjunction with topical objects is also related to the feature +/-human, i.e. it is grammatically determined. Whereas a human topic has to be always resumed pronominal, this is not obligatory with non-human topical objects. We assume that in case of contrastive topics, this hierarchy is overridden by the demand to mark the contrastive topic explicitly.

- (14) *kòkú*      ð, *Ámá* *kpóè*      \**kòkú*      ð, *Ámá* *kpó*  
*àglà*      ð, *Ámá* *kpóè*      *àglà*      ð, *Ámá* *kpó*  
 Koku/crab TP, Ama see.3sg      Koku/crabe TP, Ama see  
 ‘Koku/the crab, Ama has seen him/it.’

## 2.2 Morphological marking

As was evident from the examples, it is possible to mark the left-dislocated element further by means of morphological marker. As could be seen in example (4), two different markers are optionally present in the construction: (i) the marker *ɔ*, and (ii) the additive particle *can*.

### 2.2.1 Topicmarker *ɔ*

The first marker we will present is the topic marker *ɔ*. It is clearly related to the definiteness marker *lɔ* which expresses referentiality. The definiteness marker appears with a noun in case the referent of the noun phrase was already mentioned or is in a part-whole relation to an entity already mentioned. From this semantics follows the use as marker of topics (in morphologically reduced shape) because it mainly functions as marker of identifiability, one of the characteristics of aboutness topics. But it also acts as general background marker (Ameka 1990) in dependent clauses.

Nevertheless, its use is neither in marked topic constructions nor in dependent clauses obligatory. As we can deduce from examples (11) and (14), this morpheme does not contribute to a contrastive reading of a marked topic construction, i.e. there is no closed set of alternatives inferable. A set of alternatives can be build even in these cases, such as a set of persons or animals, but this set would be an open one.

The use of *ɔ* as background marker is exemplified in (15) where it stands at the end of a subject relative clause. In this environment, too, *ɔ* must not be used as can be seen in (15b). But other than in marked topic constructions, the pronominal resumption is not obligatory. If the subject relative clause ends with the marker, on one hand, than the subject has to be resumed pronominal – in this case with the clitic, and not with the emphatic pronoun as no overt contrast is involved. If the subject relative clause does not end with *ɔ*, on the other hand, no pronominal resumption is allowed. The reason for this asymmetry has to be left open for the moment.

(15) (concerning the wedding preparations)

- a. *èxwédùxú ló cí kòkú drá dó ó, é gàngán.*  
 fairground DEF REL Koku repair TP, 3sg be\_big
- b. *èxwédùxú ló cí kòkú drá dó gàngán.*  
 fairground DEF REL Koku repair be\_big
- ‘The fairground which Koku has prepared is big.’

To sum up, the exact conditions which trigger the use of this morphological marker are not clear. But it seems to be evident that contrast is not part of its semantics.

### 2.2.2 Additive particle *cán* ‘also’

The second marker present in the examples, *cán*, is homophone to the additive particle *cán* ‘also’. But comparable to the use of ‘auch’ in German (cf. Krifka 1999), this particle can only fulfill the function of contrastive topic marking when used with the marked topic construction as shown in (4c), repeated here for the sake of convenience as (16).

- (16) *Sámùél cán, kpó yé dé dó ndé ò.*  
 Samuel also NEG 3sg NEG have thing.INDEF NEG  
 ‘and Samuel has nothing, too.’

Example (17) shows the same construction for Ewe. Here, the contrastive topic, marked by the additive particle *há*, follows a fronted focus constituent.

- (17) *vegbe-tó-wó-é nye há me-nyé.*  
 Ewe-NOM-PL-aFOC 1sg also 1sg-COP  
 ‘An Ewe I too I am.’

(Ewe, Ameka to appear: 34)

As example (18) demonstrates for Aja, the two properties of marked topic constructions, i.e. left-dislocation and pronominal resumption, are not present if the additive particle *cán* ‘also’ is used in its proper sense to indicate that besides the dog there is another entity performing the activity of ‘running’, namely the man. This sentence has to be interpreted rather as making an assertion concerning the action than concerning the man.

(18) Context: The dog is running and chasing the man (in the forest).

- ǰsú ó cán lè jū shí kó.*  
 man DEF also PROG course run PROG

‘The man is running, too.’

Ameka (1992) pointed out that “Emphatic intensifier phrase preposing” (i.e. a marked topic construction including the additive particle) “seems to be restricted to subjects” in Ewe (Ameka 1992: 17). This analysis is interesting insofar as in its use as focus particle *cán* ‘also’ is restricted to sentence-initial position in Aja, it occurs only with subjects. Non-subjects are marked for inclusion by another particle in their canonical position (cf. Fiedler 2007 for a more extensive discussion of the two additive particles in Aja). In marked topic constructions, the condition of the sentence-initial position is maintained, but not the restriction on subjects, as example (19) demonstrates.

(19) Maria has invited some friends for dinner. For this, she has prepared different dishes.

a. *ègbłén ɔ, nyísɔ d̩iyí yí é tɔ yé d̩àd̩á.*  
akassa TP, yesterday since? FM 3sg begin 3sg cook.REDUPL

b. *èlán ɔ, é t̩ò yê èsɔ,*  
meat TP 3sg grill 3sg yesterday,

c. *ntónú cán, égbé é xó yě ké.*  
sauce TP, today 3sg hit 3sg PRED

‘As for the akassa, she already started to cook it three days before, as for the meat, she grilled it yesterday and as for the sauce, she prepared it today.’

In this example, different dishes are contrasted with each other. Whereas in the first two cases, marker *ɔ* is used, the last one represents an instance with the additive particle. All three topic expressions are resumed by the emphatic pronoun. Following this observation, it is not clear whether the additive particle as such is responsible for the contrastive interpretation, as was proposed by Krifka (1998) for German, or whether it is the pronoun which triggers this interpretation. But on the other hand, its occurrence only in the last part of the sentence for topical objects (19) as well as for topical subjects (4) suggest that with the additive particle only a contrast to a before mentioned entity can be established (cf. Jacobs 1988).

As the last example demonstrates, adverbial frames can be marked with *cán* too; however, they cannot be resumed. As Krifka (2007: 46) points out, explicit adverbial frames are in contrast with other alternatives which could set the frame in which the following utterance is to be understood. In example (20), the additive particle *cán* follows a left-dislocated adverbial phrase indicating the time frame for the event expressed in the sentence. Usually, this would be done by the background particle *ɔ* which was shown not to imply contrast. The use of the additive particle seems to contribute to a contrastive meaning, contrasting the period after the event narrated in the

story with the one before, even though the contrasting alternatives were not overtly mentioned in the context.

(20) Context: End of a fairy tale about jealousy of a woman and why chicken are given as donation for the oracle

só hwénōnù ló cán, ...

since time.DEM DEF TP

‘From this time on, (women never finish to be jealous.)’

### 3. Conclusion

The present paper has shown that contrastive topics are treated differently from aboutness topics in Gbe. Whereas the prototypical aboutness topic is represented by the subject which occurs without further marking, non-prototypical topics, such as new or inactive topics, the object as topic and contrastive topics are expressed by a special syntactically marked topic construction. This construction is mainly characterized by the left-dislocation of the topic constituent and the pronominal resumption of it in the comment part of the sentence. Optionally, the topic constituent can be marked by a particle, preferably by the background marker *ɔ*.

The contrastive reading of such a construction is, at least in Aja, not only triggered by the context, but is mirrored in three features of the construction:

1. The most important feature which indicates contrast is the use of the emphatic pronoun instead of the clitic one.
2. It seems that the additive particle also fulfills this function even though its concrete semantics is disguised by the use of the pronoun.
3. In case of contrastive topics, the additional marking of the topic by the background marker *ɔ* or the additive particle is obligatory and cannot be omitted.

On the basis of these observations, we argue that contrast is in fact expressed by special morpho-syntactic means in Gbe, thus supporting the assumption made by Molnár (2002).

## Abbreviations

aFOC – argument focus marker, CNJ – conjunction, COP – copula, DEF – definiteness marker, DEM – demonstrative pronoun, emph – emphatic, FM – focus marker, INDEF – indefiniteness marker, NEG – negation marker, NOM – nominaliser, LOC – locative preposition, PL/pl – plural, PRED – predicator, PROG – progressive, PRT – particle, Q – question marker, REDUPL – reduplication, REL – relative pronoun, sg – singular, TP – topic marker

## Abstract

The paper has proposed a theory of structural focus which analyzes focus movement as the establishment of a syntactic predicate-subject structure, expressing specificational predication. The subject of the specificational construction, an open sentence, determines a set, which the predicate (the focus-moved constituent) identifies referentially. The subject of predication is associated with an existential presupposition (only an existing set can be referentially identified). The referential identification of a set consists in the exhaustive listing of its members – hence the exhaustivity of focus. It is claimed that this analysis also accounts for properties of focus movement constructions that current alternative theories cannot explain.

**Keywords:** focus, focus movement, exhaustivity, existential presupposition, specificational predication

## 1. Goal

This paper proposes a theory of structural focus derived via focus movement which can account for all the focus-related facts attested in Hungarian, among them facts which other current theories cannot explain. It will claim that focus movement serves the purpose of creating a predicate–subject structure, in which the focus-moved constituent functions as a specificational predicate. The properties of both the focus and the background follow from the independently established properties of specificational predication constructions.

Section 2 of the paper briefly introduces two recent theories of focus movement: the 'movement for stress' theory of Szendrői (2003), and the 'movement for the checking of the exhaustive identification feature' theory of Horvath (2005), pointing out the problems which they cannot handle. Section 3 presents the proposal argued for. Section 4 demonstrates how the problems observed in section 2 receive a natural solution in the proposed framework. Section 5 discusses a further consequence of the proposed theory, involving the definiteness effect attested in presentational constructions.

## 2. Some current theories of structural focus

### 2.1. Structural focus as a phonological phenomenon

Szendrői's (2003) influential theory of structural focus aims to provide a unified analysis of English-type prosodic focus and Hungarian-type structural focus: both are claimed to be motivated by the stress–focus correspondence principle (Reinhart 1995, and Zubizarreta 1998), according to which

- (1) The focus of a clause is a(ny) constituent containing the main stress of the intonational phrase, as determined by the stress rule.

Whereas in an English-type language the stress–focus correspondence is usually attained by stress shift, in a Hungarian type language it is claimed to be achieved by the movement of focus into the position of main stress, at the left edge of the verbal projection. (Szendrői analyzes the Hungarian sentence as a VP. Topic constituents are claimed to be extrametrical adjuncts, which are skipped by the stress rule.) The V movement accompanying Hungarian focus movement serves the purpose of establishing a functional projection the specifier of which provides a landing site for focus movement.

Szendrői's 'movement for stress' theory of focusing raises several problems, namely:

- (i) The structural focus in Hungarian does not necessarily bear main stress. If it is preceded by a universal quantifier (preposed to the left edge of the VP via overt Q-raising), or certain types of adverbs, it can lack primary stress – as pointed out by Horvath (2005). In the following examples, the initial quantifier and adverb bear primary stresses, whereas the focus (spelled in capital letters) can be unstressed:

- (2) a. **'Mindenkit** [<sub>FocP</sub> JÁ NOS hívott meg]  
everybody-ACC John invited PRT  
'JOHN invited everybody. [For everybody, it was John who invited him.]'
- b. **'Valóban** [<sub>FocP</sub> JÁ NOS késett el]  
indeed John was.late PRT  
'Indeed it was John who was late.'

The focus is unstressed if it is given; e.g. (2b) would be felicitous in a context of the following type:

- (3) a. Azt gyanítom, hogy [<sub>FocP</sub> JÁ NOS késett el].  
'I suspect that it was John who was late.'

b. **'Valóban** [<sub>FocP</sub> JÁ NOS késett el]

'Indeed it was John who was late.'

The intuition is that (3b) involves a second occurrence prosodic focus, with the first focus given, hence destressed – however, Szendői does not give any hint regarding how such an analysis could be executed in the framework outlined by her.

(ii) A more severe problem is that the uniform treatment of the English-type prosodic focus and the Hungarian-type structural focus hides their interpretational difference. It remains unaccounted for why structural focus – and only structural focus – has exhaustive interpretation; why (2a), unlike its English counterpart, is true if and only if everybody was invited only by John.

The exhaustivity of structural focus was first demonstrated by Szabolcsi (1981), on the basis of solid evidence often quoted in the literature ever since.<sup>1</sup> Here let me only present two little known arguments.

According to Horn (1972), Levinson (2000), Kadmon (2001), and others, the basic meaning of a numerical modifier *n* in natural language is 'at least *n*'. Indeed, this is the meaning a Hungarian numerical modifier is associated with whether the modified expression is in postverbal argument position (4a) or in pre-focus topic position (4b). (Pragmatic factors can impose an upper limit on *n* – however, the upper limit is always a mere implicature which can be easily cancelled.) In the preverbal focus position, however, the numeral *n* can only mean 'exactly *n*' (4c), no matter what the pragmatic conditions are – which is derived from the [+exhaustive] feature of focus, i.e., the exclusion of all alternatives but the one denoted by the focused constituent in É. Kiss (to appear).

- (4) a. János [<sub>PredP</sub> meg keres **egy milliót** havonta]  
John PRT earns one million-ACC monthly  
'John earns a/one million a month.' (one million or more)
- b. [<sub>TopP</sub> **Egy milliót** [<sub>PredP</sub> meg keres János havonta]]  
'A/one million, John earns a month.' (one million or more)
- c. János [<sub>FocP</sub> EGY MILLIÓ T keres meg havonta]  
'It is one million that John earns a month.' (exactly one million)

As shown by Szabolcsi (1981), *ha* 'if' clauses are also interpreted differently in and out of focus. Conditionals, like other types of embedded clauses in Hungarian, have a pronominal head. When focused, the embedded clause is obligatorily extraposed, leaving only the

---

<sup>1</sup> See also É. Kiss (1998; to appear), and Horvath (2005, 2006). For a somewhat different view, treating the exhaustivity of focus as an implicature, see Wedgwood (2005).

pronominal head in the focus position of the matrix clause (5c). Whereas a *ha*-clause functions as a simple conditional both in postverbal position and in topic position, it is a biconditional (an *if and only if* clause) in focus position, which is again derived from the exhaustivity of focus by Szabolcsi (1981).

- (5) a. Fel-hívlak [(**akkor**<sub>i</sub>) [ha János megérkezett]<sub>i</sub>]  
 up call-I-you then if John arrived  
 ‘I will call you **if** John has arrived.’
- b. [(**Akkor**<sub>i</sub>) [ha János megérkezett]<sub>i</sub>], fel-hívlak.  
 ‘I will call you **if** John has arrived.’
- c. [<sub>FocP</sub> AKKOR<sub>i</sub> hívlak fel, [ha János megérkezett]<sub>i</sub>]  
 then call-I-you up if John arrived  
 ‘I call you **if and only if** John has arrived.’

If focusing is merely movement for stress, as claimed by Szendrői (2003), the interpretational differences between (4a,b) and (4c), and between (5a,b) and (5c) cannot be predicted.

(iii) Szendrői’s theory cannot handle the acceptability difference between (6b) and (6c). Both sentences intend to answer the question *What happened?*, i.e., both are all-new sentences. In the English equivalents, the object bears primary stress in both cases. If focusing is movement for stress, the object should be focusable in both sentences. In (6c), however, the focus-movement of the object is unacceptable.

- (6) a. Mi történt? ‘What happened?’
- b. McCAINT választották elnökjelöltnek a republikánusok az USA -ban.  
 McCain-ACC elected candidate the republicans the USA-in  
 ‘Republicans elected McCain presidential candidate in the USA.’
- c. %BENAZIR BHUTTÓ T gyilkolták meg a fanatikusok Pakisztánban.  
 Benazir Bhutto-ACC murdered PRT the fanatics in Pakistan  
 ‘Fanatics murdered Benazir Bhutto in Pakistan.’

This example is also problematic for the focus theory of Fanselow (2006), according to whom focus movement is nothing but the movement of an accented constituent, and the focus position is not associated with any special semantic or pragmatic function.

(iv) According to Szendrői (2003: 37) the focus of an answer is the constituent that is questioned. In question-answer pairs like that in (7), however, it is the other way round: it is the familiar, non-questioned constituent of the question that has to undergo focus movement in the answer – contrary to prediction:

- (7) a. Ki volt Fleming?/Mit tudsz Flemingről?  
 ‘Who was Fleming?/What do you know about Fleming?’  
 b. Ő/FLEMING fedezte fel a penicillint.  
 he/Fleming discovered PRT the penicillin  
 ‘It was him/it was Fleming who discovered penicillin.’

A proper theory of structural focus should also account for examples of this type.

## 2.2. Structural focus as a constituent with an exhaustive identification operator

In reaction to Szendrői’s theory of focus, Horvath (2005, 2006) has developed an alternative theory intended to account for the exhaustivity of the Hungarian focus, while maintaining the unified treatment of English and Hungarian focus. She claims that structural focus is an XP with an invisible Exhaustive Identification operator (EIOp) in its specifier, attracted to the specifier of an Exhaustive Identification Phrase in order to check the Exhaustive Identification features of its head. The EIOp requires association with focus.

This theory only eliminates problem (ii) of the stress-driven theory of focus movement, and also raises new problems, among them:

(v) The theory – correctly – acknowledges the structural difference between sentences of type (8a) and those of type (9a), which becomes transparent under negation. In (8a), *orvos* ‘doctor’ occupies the specifier of EIP, where it precedes the verb also when negated:

- (8) a. Az apám [EIP ORVOS [volt]].  
 my father doctor was  
 ‘My father was a doctor.’  
 b. Az apám [NegP nem [EIP ORVOS [volt]]]  
 my father not doctor was  
 ‘My father wasn’t a doctor.’

In (9a), on the other hand, *jó orvos* ‘good doctor’ occupies the position of the verbal modifier (identified here as Spec,PredP), where it is preceded by the V, undergoing head movement, in negative sentences:

- (9) a. Az apám [PredP jó orvos [Pred' volt]].  
 my father good doctor was  
 ‘My father was a good doctor.’  
 b. Az apám [NegP nem [volt [PredP jó orvos]]]

my father not was good doctor

‘My father wasn’t a good doctor.’

What Horvath’s theory leaves unexplained is why *orvos* – as opposed to *jó orvos* – is to be focused in the unmarked case.

(vi) In the framework of the EIOp theory, the object in (10) is associated with an EI operator, the effect of which is cancelled by the expression *többek között* ‘among others’. It seems uneconomical to introduce an operator and immediately neutralize it.

(10) *Többek között JÁ NOST hívtam meg. / JÁ NOST hívtam meg többek között.*

among others John-acc invited-I PRT

‘It was John, among others, that I invited.’

(vii) Hungarians tend to move to focus position also constituents whose interpretation is inherently exhaustive.

(11) *Andrásnak [FocP DECEMBER 13-ÁN van a születésnapja]*

Andrew December 13th-on has the birthday-his

‘It is on December 13th that Andrew has his birthday.’

December 13th exhausts the set of days of Andrew’s birth. It seems redundant, hence uneconomical, to mark its exhaustivity also with an EI operator.

(viii) It does not follow from the theory why universal quantifiers cannot be focussed:

(12)\**MINDEN FIÚ T hívtam meg.*

every boy-ACC invited-I PRT

‘I invited everybody.’

(ix) It is unexplained why a bare nominal, ungrammatical in argument position, becomes perfectly acceptable if focussed:

(13) a. *\*Évát fel-kérte szőke fiú.*

Eve-ACC PRT asked[for a dance] blond boy-NOM

b. *Évát SZŐKE FIÚ kérte fel.*

‘It was a blond boy that asked Eve for a dance.’

### 3. The proposal: focus as a specificational predicate

The present proposal adopts Higgins's (1973) analysis of the English pseudo-cleft focus, and Huber's (2000) analysis of the Swedish and German cleft focus to Hungarian structural focus.<sup>2</sup> In the theory developed by Higgins and Huber, pseudo-cleft and cleft sentences instantiate a type of predication structure called specificational predication. The *wh*-clause represents the subject of predication, and the (pseudo-)cleft constituent, identified as the focus, represents the predicate. In specificational predication constructions, neither the subject, nor the predicate is claimed to be referential.<sup>3</sup> In the formulation of Huber (2000), the subject determines a set, and the predicate referentially identifies it, by listing its members. The predicate, i.e., the (pseudo-)cleft focus, is exhaustive because the referential identification of a set consists in the exhaustive listing of its members. The subject is associated with an existential presupposition because only an existing set can be referentially identified.

I claim that focus movement in Hungarian – and presumably in other languages, as well – serves the purpose of establishing a predicate–subject articulation to be interpreted as a specificational predication construction. The focus-moved constituent functions as the specificational predicate, and the post-focus sentence part (the background) functions as the subject of predication.<sup>4</sup> The subject of predication, an open sentence, determines a set, which the focus identifies referentially. The referential identification of the set determined by the background is predicted to entail the exhaustive listing of its members. Furthermore, the background is predicted to be associated with an existential presupposition.

#### **4. The facts explained**

From the proposed analysis, all the properties of the Hungarian focus construction fall out, including the problematic facts enlisted under (i)-(ix) above.

Focus movement is triggered by the need of creating a predicate–subject structure, with the predicate and the subject mutually *c*-commanding (or *m*-commanding) each other.

The fact that focus-movement goes together with *V*-movement seems to be independently motivated, as focusless negated sentences and e.g. imperatives also involve *V*-movement. Apparently, a neutral predicate, with its preverbal position occupied by the

---

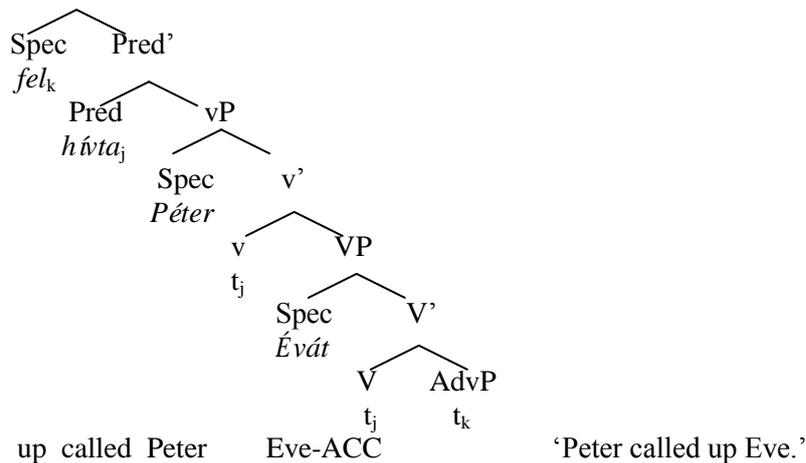

<sup>2</sup> For previous formulations of this proposal, see É. Kiss (2006a,b). For an extension of Higgins' (1973) analysis to English truncated clefts, see Mikkelsen (2004).

<sup>3</sup> Mikkelsen (2004) argues that the predicate of a specificational construction is, nevertheless, more referential than its subject.

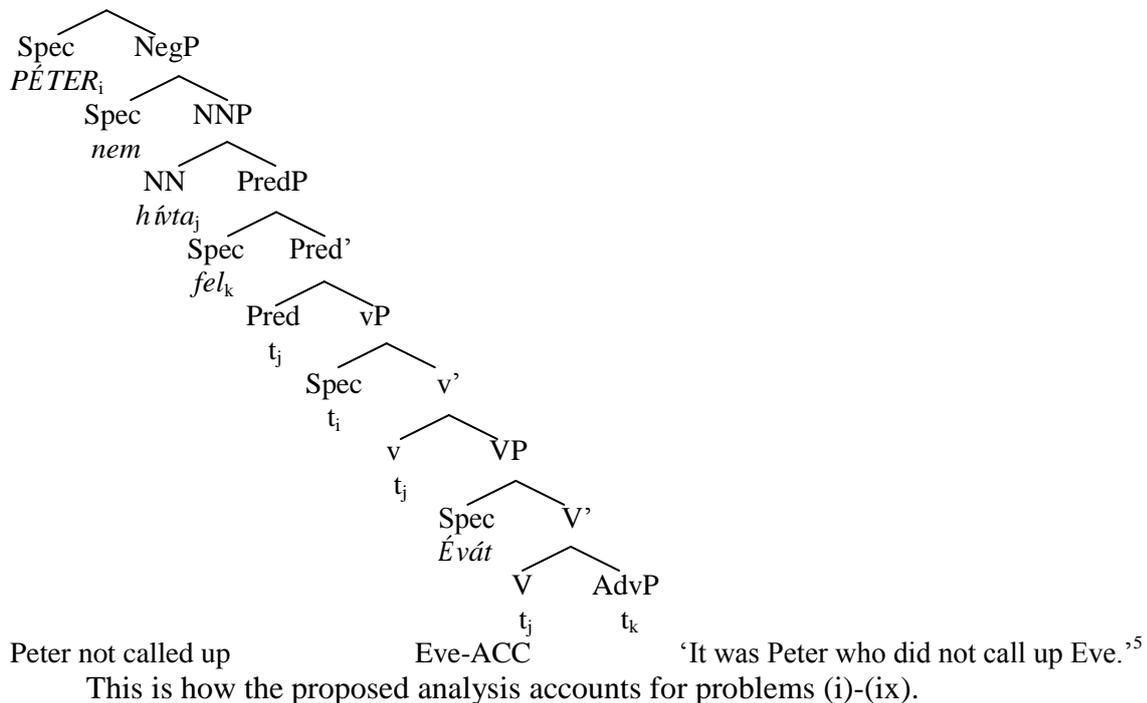

<sup>4</sup> Although in subsequent stages of the derivation, *Q*-raising and topicalization can remove certain constituents of the post-focus unit (the subject of predication), they remain represented by their copies in postverbal position.

secondary predicate: a verbal particle, a predicative NP or a predicative AdvP (see, e.g., (14)) cannot be further extended by an operator; it can merely be merged with Q-raised quantifiers, adverbials, and topics. The neutral predicate can only be combined with a further operator if it becomes V-initial, i.e., if it undergoes V-movement (see, e.g., (15)). Thus V-movement signals a kind of type-shift: the predicate phrase becoming the argument of a higher predicate.

(14) PredP

(15) FocP

Problem (i), illustrated by examples (1a,b), concerns the question why the structural focus of the Hungarian sentence does not always bear main stress. In the proposed framework, there is

<sup>5</sup> The postverbal section of the Hungarian sentence, i.e., the vP in (14), and the PredP in (15), can be freely linearized. The optimal postverbal order is that observing Behaghel's (1932) Law of Growing Constituents - see É. Kiss (2008).

no direct relation between structural focus and stress. In Hungarian, Nuclear Stress is assigned to the leftmost constituent in a phrase. There is also a stress-reduction rule which destresses given (anaphoric) constituents. If the filler of Spec,FocP is preceded by quantifiers and/or adverbials adjoined to FocP, they are also assigned Nuclear Stresses, as shown in (1a) and (1b). Any of the constituents marked as 'strong' by the Nuclear Stress Rule can also be destressed, if it is anaphorically given. This is what happens to the focus in both (1a) and (1b).

Problems (ii), (vi) and (vii), related to the exhaustivity of structural focus, are explained by the specificational predicate function of focus. Specification means the referential identification of a set by listing its members, hence it is understood to be exhaustive, as illustrated by examples (4) and (5). However, exhaustivity is not asserted in focus constructions; it is merely entailed. That is why focusing is not redundant even when exhaustivity appears to be neutralized right away by the overt expression *többek közt* 'among others' (cf. (10)), and when it is also lexically entailed, as in (11). Sentences (10) and (11) are not formulated as specificational constructions in order to mark the exhaustivity of focus. (11) serves the purpose of identifying the day when Andrew has his birthday, whereas (10) serves the purpose of specifying the set of those I invited. This set is specified in part by an R-expression (*János*), in part by a kind of pronominal expression (*többek (közt)* '(among) others').

Examples (6) and (8)-(9), illustrating problems (iii) and (v), show that specificational predication is licensed if the background is associated with an existential presupposition.<sup>6</sup> Although both (6b) and (6c) are all new sentences answering the question *What happened*, in the case of (6b) it is part of the knowledge base of the speaker and the listener that there is someone that the Republicans will elect, or have already elected, presidential candidate in the USA.<sup>7</sup> In the case of (6c), the focus-background articulation is impossible because the background lacks an existential presupposition: When Benazir Bhutto was murdered, it was not shared knowledge that there was someone that fanatics would murder or had already murdered in Pakistan.

The minimal pair in (8) and (9) illustrate the same point. In the case of a grown-up person it is presumed that he has an occupation; when asking (8a) we are merely interested in

---

<sup>6</sup> According to Geurts and van der Sandt (2004), the background is associated with an existential presupposition in all types of focus constructions. They call the following rule 'the null hypothesis':

(i) The Background-Presupposition Rule

Whenever focusing gives rise to a background  $\lambda x.\varphi(x)$ , there is a presupposition to the effect that  $\lambda x.\varphi(x)$  holds of some individual.

<sup>7</sup> Delin & Oberlander (1995) make a similar claim about the subordinate clause of cleft sentences: they count as presuppositional also when they convey information that is expected to be known.

the specification of this occupation. Thus (8a) amounts to asking 'is it true that the profession that your grandfather had is the profession *doctor*?' Being a good doctor, on the other hand, is not the specification of a generally held assumption.

Problem (iv) is also related to problems (iii) and (v). The question is why we have to focus *Fleming/he* in (7b), when *Fleming/he* represents the only given element in the sentence.

Observe another question–answer pair illustrating the same point:<sup>8</sup>

(16) a. Who was Jack Ruby?

b. [<sub>FocP</sub> Ö [<sub>NNP</sub> löttte le Lee Harvey Oswaldot]]

he shot PRT Lee Harvey Oswald

'It was him who shot Lee Harvey Oswald.'

Both (7b) and (16b) are clear instances of specificational predication: their backgrounds determine a set associated with an existential presupposition (the set 'who invented penicillin', and the set 'who shot Lee Harvey Oswald', respectively), which the focus referentially identifies. It is not a requirement that the set to be specified must be given information, and the listing of its member(s) must be new; it can just as well be the other way round, as happens in (7) and (16).

The focus–background articulation of the answer is not licensed if the background is not associated with an existential presupposition; thus the discourse in (17) is unacceptable – unless there has already been discussion about a certain man who shot his wife.

(17) Who was John Smith?

% [<sub>FocP</sub> Ö [<sub>NNP</sub> löttte le a feleségét]]

he shot PRT his wife

'%It was him who shot his wife.'

Problem (viii) was the question why a universal quantifier cannot be focussed. Giannakidou and Quer (1995) have shown that universal quantifiers cannot be used as predicate nominals, in other words, as nominal predicates. If the focus functions as a predicate, the impossibility of focussing a universal quantifier is predicted.<sup>9</sup>

<sup>8</sup> The English equivalents of (7b) and (16b) are called comment-clause clefts by Delin and Oberlander (1995).

<sup>9</sup> Puskas 2000:342) claims that this does not hold in Hungarian, on the basis of examples like

(i) Emőke (volt) minden örömöm.

Emőke (was) all joy-my

'Emőke is/was all my joy.'

According to Surányi (2002), the constraint formulated by Giannakidou and Quer (1995) does not apply to *all*-type universal quantifiers. However, in Hungarian, *every* and *all*-type quantifiers do not seem to differ in the relevant respect (neither of them can be focussed). In my analysis, *Emőke* is the predicate nominal in (i), and

Problem (ix), illustrated by example (13), also represents a consequence of the predicate status of focus. A bare NP, which cannot function as an argument,<sup>10</sup> is grammatical as a predicate in Hungarian:

- (18) a. Éva vőlegénye szőke fiú (volt).  
 Eve's fiancé blond boy (was)  
 'Eve's fiancé is/was a blond boy.'
- b. A tettest szőke fiúnak hitték.  
 the offender-ACC blond boy-DAT saw-they  
 'The offender was seen to be a blond boy.'

In (13b), the bare nominal subject is grammatical because the focus position it occupies is associated with a (specificational) predicate interpretation.

## 5. A further consequence of the proposal

The proposed analysis is further supported by the fact that it has good consequences in other areas of grammar, as well. For example, it can explain a curious correlation between focusing and definiteness effect.

As is well-known from the literature (Szabolcsi 1986, É. Kiss 1995, Piñón 2006a,b, Peredy 2008, and the references therein), verbs of (coming into) being and creation require a non-specific theme. Compare:

- (19) a. Született egy baba.                      b.\*A baba született.  
 was.born a baby                              the baby was.born  
 'A baby was born.'                              'The baby was born.'
- (20) a. János szerzett egy autót.              b.\*János minden autót szerzett.<sup>11</sup>

---

*minden örömem* is the subject. If *minden örömem* were a predicate nominal, it ought to be able to precede the verb *volt* (occupying first Spec,PredP, and then Q-raised into a PredP-adjoined position). Furthermore, if *Emőke* were the subject, it ought to be able to undergo topicalization, i.e., to occupy an unstressed clause-initial position. Both of these moves are impossible:

- (ii)\*Emőke 'minden öröömöm volt.  
 Emőke all joy-my was  
 'Emőke was all my joy.'

Cf.

- (iii) Minden öröömöm Emőke volt.  
 'All my joy was Emőke.'

<sup>10</sup> In fact, a semantically incorporated theme or goal argument, occupying Spec,PredP, the position of secondary predicates, can be represented by a bare nominal.

John obtained a car                      John every car obtained

Interestingly, the focusing of an adjunct, or the focusing of the agent neutralizes the 'definiteness effect', i.e., the non-specificity requirement on the theme; the focusing of the theme, on the other hand, has no such neutralizing effect:

(21) a. A baba TEGNAP született.

the baby yesterday was.born

'The baby was born YESTERDAY.'

b.\*A KISLÁNY született.

the little.girl was.born

'THE LITTLE GIRL was born.'

(22) a. Minden autót JÁNOS szerzett.

every car-ACC JOHN obtained

'Every car was obtained by JOHN.'

b. János minden autót ILLEGÁLISAN szerzett.

John every car illegally obtained

'John obtained the car from a relative of his.'

Szabolcsi (1986) derived the (in)definiteness effect illustrated in (19) and (20) from the meaning of the verbal predicates: they assert the (coming into) being of their theme argument; hence the existence of their theme cannot be presupposed; that is why they cannot be associated with a determiner eliciting a [+specific] reading. In (21) and (22), both the verb expressing coming into being and the theme whose coming into being it denotes constitute (part of) the background of a focus-background construction, in other words, (part of) the subject in a specificational predication structure. (More precisely, in (22) it is the variable bound by the Q-raised universal quantifier that represents the theme argument in the background/subject of predication.) Recall that the subject of a specificational predication construction is associated with an existential presupposition, i.e., the event of the theme's

---

<sup>11</sup> Hungarian verbs of (coming into) being and creation also have particle verb counterparts, which denote the change of their theme, the existence of which is presupposed. These particle verbs, as opposed to their bare V equivalents, select a [+specific] theme:

(i)a. A gyerekek meg-születtek.

the children PRT-were.born

'The children were born.'

b.\*Gyerekek meg-születtek.

(ii)a. János meg-szerelte az autókat.

John PRT obtained the cars

'John obtained the cars.'

b.\*János meg-szerzett autókat.

coming into being is presupposed in both cases; that is why also a [+specific] theme is licensed. However, if the theme is the focus/specificational predicate, no existential presupposition is assigned to it, hence the (in)definiteness effect is not neutralized.

## 6. Conclusion

The paper has proposed a theory of structural focus which analyzes focus movement as the establishment of a syntactic predicate-subject structure, expressing specificational predication in the sense of Higgins (1973) and Huber (2000). It is claimed that this analysis also accounts for properties of focus movement constructions that current alternative theories cannot explain. The subject of a specificational construction, an open sentence, determines a set, which the predicate (the focus-moved constituent) identifies referentially. The crucial properties of a specificational predication construction are the existential presupposition associated with the subject of predication (only an existing set can be referentially identified), and the exhaustivity of the focus (the referential identification of a set consists in the exhaustive listing of its members). Hence the [+exhaustive] feature of the focus is not asserted, but is always present as an entailment. The specificational predicate–subject of predication (in other words, the focus–background) articulation of the sentence does not correlate with either the new–given division of the information conveyed (the open sentence determining the set to be identified (i.e., the background) can also be new, and the listing of the members of the set (i.e., the focus) can also be given). There is no direct correlation between the focus–background articulation and the stress pattern of the sentence, either (e.g., a given focus can be destressed).

**Focus and the Typology of Questions:  
a non-derivational approach to inter- and intra-language variation**

Louise Mycock

University of Manchester

**Abstract**

The role of Information Structure, and specifically the discourse function focus, in the formation of constituent ('wh') questions has to date only partially been explored. For the most part, analyses of typological variation in constituent question (CQ) formation strategies have ignored crucial aspects of linguistic structure, most notably their intonation. In this paper, I explore Questioning Focus, its syntactic and prosodic correlates, and its relevance to inter- and intra-language variation in the strategies used to form CQs. A preliminary survey of the typological range of CQ formation strategies, which considers not only the syntactic and prosodic correlates of Questioning Focus but also the expression of Sorting Key status, forms the basis for a unified, non-derivational analysis.<sup>1</sup>

## 1 Introduction

Constituent ('wh') questions satisfy an important communicative need: they highlight a gap (1a) or gaps (1b) in the speaker's knowledge.<sup>2</sup>

(1) a. SINGLE CONSTITUENT QUESTION

Q: *What* did Charlie eat?

A: Charlie ate chocolate.

b. MULTIPLE CONSTITUENT QUESTION

Q: *Who* ate *what*?

A: Dave ate chocolate, Charlie ate crisps, and Lily ate sweets.

The role of Information Structure, and in particular the discourse function focus, in the formation of constituent questions (CQs) is an important issue which has been explored by a number of researchers over the years (e.g. Erteschik-Shir 1986). While the standard test for identifying focus in a declarative is to examine the relationship between a CQ-answer pair, the information-structural status of question phrases themselves is more controversial. It has been assumed, by analogy with the status of its 'answer constituent', that a question word is the focus of a CQ. Evidence to support this claim has largely come from written data: a correlation between the syntactic position of a question word and that of a non-interrogative focused constituent has been noted in a number of languages. For example, in a

Hungarian CQ, a question word appears in the same immediately preverbal position associated with focusing in a declarative.

(2) HUNGARIAN<sup>3</sup>

Q: János [ki-nek]<sub>FOCUS</sub> mutat-t-a be

John.NOM who-DAT introduce-PAST-DEF.3SG VM

Mari-t?

Mary-ACC

‘Who did John introduce Mary to?’

A: János [Anná-nak]<sub>FOCUS</sub> mutat-t-a be

John.NOM Anna-DAT introduce-PAST-DEF.3SG VM

Mari-t.

Mary-ACC

‘John introduced Mary to ANNA.’

To date, the majority of analyses have concentrated overwhelmingly on the syntax of CQs, defining their formation in terms of one underlying syntactic strategy involving movement of a question phrase or phrases. The notion of movement, which is internal to derivational theories of linguistic structure, is central to the traditional tripartite typology of CQ formation strategies. According to this type of approach (see, e.g., Cheng 1997; Richards 2001), the fundamental difference between languages is whether the CQ formation strategy which they employ necessarily involves (overt) ‘displacement’ of

no question phrase (3), one question phrase (4), or all question phrases (5) in comparison to their non-interrogative equivalents in declarative sentences (in italics).

(3) JAPANESE

a. Mari-ga *doko-ni nani-o* okimashita ka.

Mari-NOM where-LOC what-ACC put.PAST Q-PART

‘What did Mary put where?’

b. Mari-ga *tēburu-ni ringo-o* okimashita.

Mari-NOM table-LOC apple-ACC put.PAST

‘Mary put the apple on the table.’

(4) ENGLISH

a. *What* did Mary put *where*?

b. Mary put *the apple on the table*.

(5) SLOVENE

a. *Kdo koga komu* hvali?

who.NOM who.ACC who.DAT praise.PRES.3SG

‘Who praises who to who?’

b. *Roman*      *Heleni*      *hvali*      *Marjano.*  
Roman.NOM   Helena.DAT   praise.PRES.3SG   Marjana.ACC  
'Roman praises Marjana to Helena.'

The aim of this paper is to move away from a conception of CQ formation in terms of syntax alone, and instead present a typology of the strategies used to form CQs which is based on empirically identifiable features of the expression of Information Structure at the level of syntax and/or prosody.<sup>4</sup> In Section 2, I introduce the sub-function of focus relevant to CQ formation (Questioning Focus) and discuss how this may be expressed, as well as the notion of the Sorting Key in a multiple CQ. The relationship between focus and the syntax (Section 3) and prosody (Section 4) of CQs in three case-study languages is then discussed. On the basis of the variables identified, I propose a non-derivational analysis (Section 5), and show how this captures facts about inter- and intra-language variation in CQ formation (Section 6).

## **2      CQs and Information Structure**

### *2.1      Focus types and realization*

Dik (1997) identifies different types of focus on the basis of their communicative purpose. Dik's (1997: 331) primary division is between

Information Gap Focus and Contrastive Focus. Information Gap Focus is further divided into Questioning (i.e. the information gap signified by the question phrase) and Completive (i.e. the filler of the information gap, the ‘answer constituent’). This distinction is supported by evidence from, for example, Hungarian. In this language, multiple question phrases may occupy immediately preverbal ‘focus position’, but the same is not true of multiple non-interrogative phrases or a combination of interrogative and non-interrogative focused constituents (Puskás 2000: 227), i.e. multiple Questioning Foci are permitted in ‘focus position’, but multiple Completive Foci, or a combination of the two, are not.

As well as focus type, focus may vary with regards to its expression. Setting aside for a moment the precise sub-type of focus involved, examples show that a number of different strategies may mark a focused constituent – in the most general sense of focus – at one or more levels of linguistic structure (prosodic (6a), syntactic (6b), morphological).

(6) a. PROSODIC FOCUSING

Mark bought FLOWERS for Fiona.

b. SYNTACTIC FOCUSING – CLEFTING

It was flowers that Mark bought for Fiona.

Different focusing strategies may correlate with different types of focus. For instance, as Hajičová (1983) observes, Questioning Focus in a regular CQ such as (7a) is expressed via fronting of the single question word, so it appears in clause-initial position (syntactic focusing). In (7b), prosodic focusing marks the question word as also being contrastively focused.<sup>5</sup>

(7) a. QUESTIONING FOCUS: FRONTING (SYNTACTIC FOCUSING)

What did he buy?

b. QUESTIONING FOCUS (SYNTACTIC FOCUSING) + CONTRASTIVE

FOCUS (PROSODIC FOCUSING)

WHAT did he buy?

One type of focus does not necessarily preclude another and the same is true of types of focusing strategy.

## 2.2 *Sorting Key*

As (3)–(5) indicate, the formation of multiple CQs is central to the typology of CQs. It is therefore worth noting that one question phrase in a multiple CQ appears to be distinct in terms of its precise information-structural status, i.e. it appears to belong to a category which other question phrases do not. This question phrase is identified as belonging to the category ‘Sorting Key’ by Kuno & Takami (1993: 112).<sup>6</sup> The Sorting Key is the question

phrase that a multiple CQ is ‘about’; it communicates how the questioner expects information to be organized in the answer, and therefore is a crucial factor in determining the (in)felicity of an answer. Compare the acceptability of (8b) and (8b') as answers to the multiple CQ (8a).

(8) ENGLISH

- a. *Which of these climatic conditions occurs in which countries?*
- b. *Typhoons occur in Japan, Korea and China; hurricanes occur in ...*
- b'. *#In Japan, typhoons and early summer rain spells occur; in Thailand, they have monsoons and tornadoes; ...*

(Kuno 1982: 144)

Kuno (1982) claims that sentence (8b') is judged to be a less acceptable answer than (8b) by many speakers because the multiple CQ in (8a) is about climatic conditions (the Sorting Key is *which of these climatic conditions*), whereas (8b') is a statement about countries.

On the basis of English and Japanese data, Kuno & Takami (1993) formulate a hypothesis concerning the realization of the Sorting Key in terms of a single criterion: linear order. Kuno & Takami (1993: 112) claim that the leftmost question phrase in a CQ is the Sorting Key. However, in Hungarian the Sorting Key is the rightmost, immediately preverbal question

word. Kuno & Takami's (1993) generalization about Sorting Key realization therefore does not apply cross-linguistically.

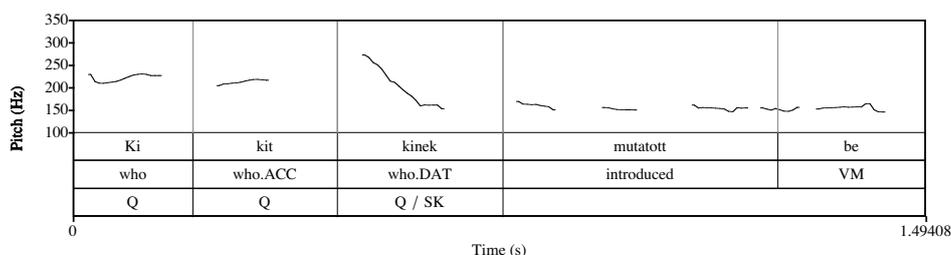

As in the case of focus, it seems that Sorting Key status can be marked in a variety of (not necessarily syntactic) ways cross-linguistically. Mycock (2006) shows that the Hungarian Sorting Key is distinct from other (syntactically) focused question words because it is simultaneously focused at the level of prosody. In (9), the Sorting Key is *kinek* 'who'; all question words appear immediately preverbally and thus are focused at the level of syntax, but the Sorting Key (SK) alone bears the sharp falling pitch contour, realized within an expanded pitch range and followed by a low plateau, that is associated with prosodic focusing in this language (see, e.g., Mycock 2006).

(9) HUNGARIAN

*Ki*            *ki-t*            *ki-nek*            mutat-ott            be?

who.NOM    who-ACC    who-DAT    introduce-PAST.DEF.3SG VM

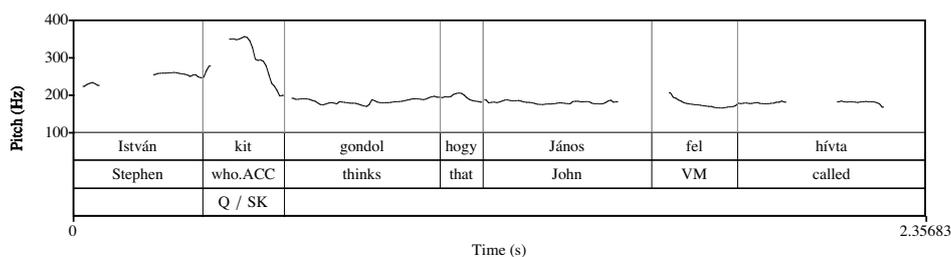

'Who introduced who to who?'

The period of pitch range variation initiated by the Sorting Key correlates with the scope of interrogativity in a matrix CQ which involves a long-distance dependency because, as (10) shows, pitch range variation continues to the end of the sentence, i.e. affects the scaling of tones in the subordinate clause as well.<sup>7</sup>

(10) MATRIX CQ (LONG-DISTANCE DEPENDENCY)

István *ki-t* gondol, [hogy János  
 Stephen.NOM who-ACC think.PRES.3SG that John.NOM  
 fel-hív-t-a]?  
 VM-call-PAST-DEF.3SG  
 ‘Who does Stephen think John called?’

I therefore hypothesize that the Sorting Key in a CQ is distinct at some level of linguistic structure; it has Questioning Focus status just as other non-Sorting Key question words do, but it is also crucially part of a configuration which indicates the extent of interrogativity. Given this, the

realization of Sorting Key status represents another parameter along which CQ formation strategies may vary.

In order to assess more fully how Questioning Focus and the notion of Sorting Key relate to CQ formation cross-linguistically, I seek to separate empirical observations from the theory-internal formal assumptions and categories with which they have often been associated. To this end, in the next two sections, I consider the syntactic and prosodic correlates of Questioning Focus and Sorting Key status in three case-study languages.

### **3 Focus and the syntax of CQs**

#### *3.1 Japanese*

Japanese is a language with a rich morphological system and relatively free word order, though typically it is SOV.<sup>8</sup> It is an ‘in-situ’ language, meaning that CQ formation does not result in any change in the order of constituents and therefore Questioning Focus is not signalled syntactically, cf. (11) and (12). A final question particle may be added to a question, but this is obligatory only in written Japanese (Hinds 1986: 7).

(11) Mari-ga depāto-de Gorō-ni ranpu-o eranda.  
 Mari-NOM dept.store-LOC Gorō-DAT lamp-ACC choose.PAST  
 ‘Mari chose a lamp for Gorō at the department store.’

(12) *Dare-ga* depāto-de *dare-ni* ranpu-o eranda  
 who-NOM dept.store-LOC who-DAT lamp-ACC choose.PAST  
 ka.  
 Q-PART  
 ‘Who chose a lamp for who at the department store?’

As mentioned in Section 2, the leftmost question phrase in a CQ acts as the Sorting Key (Kuno & Takami 1993: 116).

### 3.2 Slovene

Slovene is a language with highly flexible word order, facilitated by its rich system of inflectional morphology which serves to signal the grammatical functions of constituents. The ordering of constituents is governed largely by discourse principles: the unmarked order adheres to the basic principle that ‘older’ recoverable information precedes newer information (Priestly (1993: 427; *inter alia*). However, for extra emphasis, a constituent order which does not conform to the usual old > new information order may be employed. This syntactic focusing strategy is part of multiple CQ formation:

question phrases appear together clause initially (Golden 1997).

Questioning Focus is thus signalled by multiple syntactic focusing.

- (13) Roman        je        Heleni        hvalil        Marjano.  
Roman.NOM    AUX.3SG    Helena.DAT    praise.PRT.3SG    Marjana.ACC  
'Roman praised Marjana to Helena.'

- (14) *Kdo*        je        *koga*        *komu*        hvalil?  
who.NOM    AUX.3SG    who.ACC    who.DAT    praise.PRT.3SG  
'Who praised who to who?'

There are clear parallels with the Hungarian CQ formation strategy described in Section 2. In contrast to Hungarian though, the clause-initial question phrase group is divisible. In (14), the auxiliary verb clitic *je* separates one question word *kdo* 'who' from the rest, thus indicating that the first question phrase occupies a syntactic position distinct from the others.

The clause-initial question word has Sorting Key status and its presence marks that clause as interrogative, cf. (15) and (16), in which underlining indicates the extent of interrogativity.

(15) EMBEDDED CQ

Miha je vprašal, [*koga* je \_\_\_\_\_

Mike.NOM AUX.3SG ask.PRT.3SG who.ACC AUX.3SG

Roman hvalil Heleni].

Roman.NOM praise.PRT.3SG Helena.DAT

‘Mike asked who Roman praised to Helena.’

(16) MATRIX CQ (LONG-DISTANCE DEPENDENCY)

*Koga* misli Miha, [da je \_\_\_\_\_ Roman \_\_\_\_\_

who.ACC think.PRES.3SG Mike.NOM that AUX.3SG Roman.NOM

hvalil Heleni]?

praise.PRT.3SG Helena.DAT

‘Who does Mike think Roman praised to Helena?’

The Sorting Key alone is thus crucially part of the syntactic configuration which indicates the extent of interrogativity, in line with the hypothesis in Section 2.

### 3.3 *English*

English on the whole lacks the means to mark grammatical functions morphologically. Rather, it is a language in which grammatical functions are

associated principally with specific phrasal configurations, which explains its relatively rigid SVO order.

Multiple CQs are characterized by the presence of one and only one clause-initial question phrase, which acts as the Sorting Key (Kuno & Takami 1993).

- (17) a. Alan introduced Bill to Sue.  
b. *Who* did Alan introduce to *who*?  
c. I wonder [*who* Alan introduced to *who*].  
d. *Who* do you think [introduced *who* to *who*]?

The clause-initial Sorting Key phrase occupies a syntactic position associated with the discourse function focus; all other question phrases appear ‘in situ’. Hence, the Sorting Key and only the Sorting Key is (i) syntactically focused, and (ii) crucial to delimiting the extent of interrogativity in the syntax. English multiple CQ therefore involves a single instance of syntactic focusing.

### 3.4 Data summary

The generalizations which can be made about the role of syntactic focusing in CQ formation, as exemplified by the three case-study languages, are summarized in Table 1.

TABLE 1. The relationship between syntactic focusing and the strategies used to form multiple CQs in the three case-study languages.

SYNTACTICALLY FOCUSED QUESTION PHRASE(S)	CASE-STUDY LANGUAGE
none	Japanese
Sorting Key only	English
multiple	Slovene

While the syntactic marking of Questioning Focus is a part of the CQ formation strategies employed in English and Slovene respectively, this is not true for an ‘in-situ’ language such as Japanese.

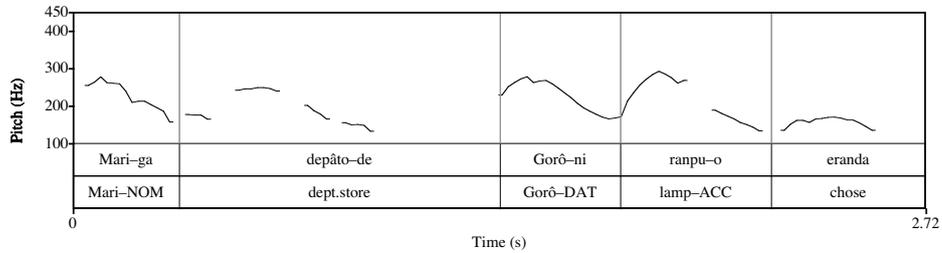

## 4 Focus and the prosody of CQs

### 4.1 *Japanese*

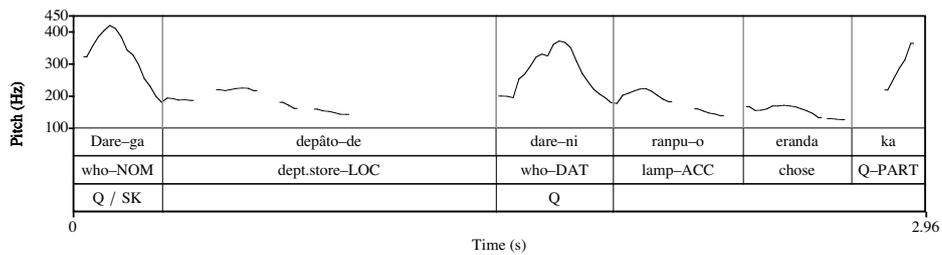

Pierrehumbert & Beckman (1988: 99) note that pitch range variation has been identified as an acoustic correlate of relative discourse salience in a number of languages. Pitch range is the set of values in the vertical dimensions of the Fundamental Frequency ( $F_0$ ) space within which all tones are scaled for a specific prosodic domain and speaker, i.e. pitch range is the difference between the minimum and maximum pitch values recorded. A speaker's pitch range may be expanded (indicating greater discourse salience) or compressed (indicating lesser discourse salience) relative to its usual value.

Researchers including Ishihara (2002) have identified pitch range variation as indicating relative discourse salience at the post-lexical level in Tokyo Japanese: the tones of a (prosodically) focused constituent are scaled within an expanded pitch range which is then followed by a low plateau that is the result of pitch range compression. This distinctive pattern of pitch range variation is also found in CQs (e.g. Ishihara 2002), i.e. it seems that Questioning and Contrastive Foci can be expressed using the same prosodic means in Tokyo Japanese. Compare the pitch-track for the declarative sentence in (11) with that of the multiple CQ in (12).

(11') DECLARATIVE

(12') MULTIPLE CQ

Note that the tones of the question words in (12') are scaled within a wider pitch range than those of their non-interrogative equivalents in (11'), and pitch range compression, which manifests itself as a low plateau, intervenes between the question words in (12') and follows *dare-ni* 'who' before the final sharp rise, realized on the question particle *ka*. This final sharp rise is an obligatory feature of CQs in spoken Japanese,<sup>9</sup> and indicates the cessation of pitch range variation.

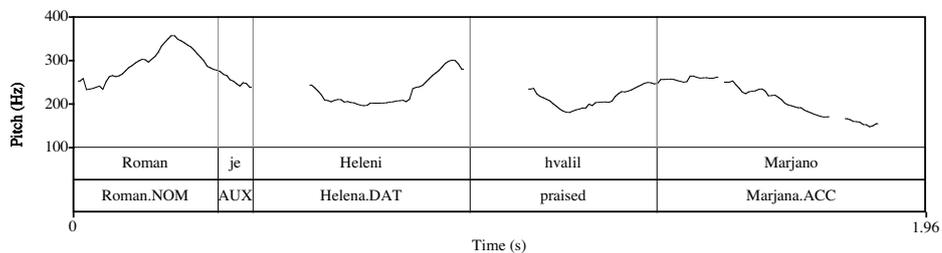

Data such as (11') and (12') support the hypothesis that CQ formation necessarily involves Questioning Focus. Rather than being expressed syntactically though, Questioning Focus is associated with a specific pattern of prosody in Japanese, i.e. Japanese CQ formation involves multiple prosodic focusing.

The Sorting Key *dare-ga* 'who' is the question word which initiates the period of pitch range variation in (12'). According to Ishihara (2004), amongst others, pitch range variation correlates with the scope of interrogativity in regular CQs in Tokyo Japanese. Once again, in line with the hypothesis concerning its realization presented in Section 2.2, the Sorting Key is a crucial element of a configuration which indicates the extent of interrogativity in a CQ. This configuration is prosodic rather than syntactic in Tokyo Japanese, and the Sorting Key marks its left edge.

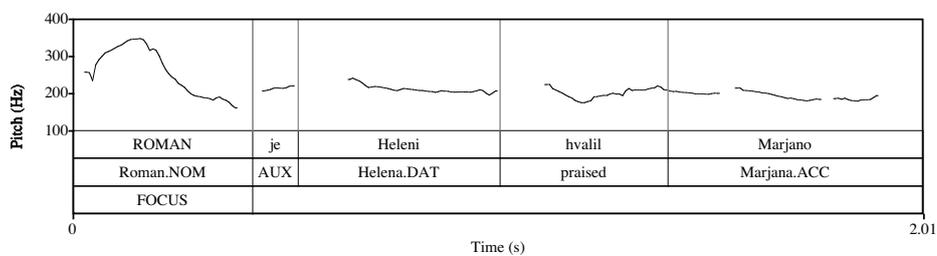

#### 4.2 *Slovene*

In Slovene, Contrastive Focus expressed prosodically involves a scaling of tones within an expanded pitch range, followed by a low plateau, much like that identified in Hungarian and Japanese. Compare the pitch-track for (13) with a version of the same sentence in which the Contrastive Focus status of the clause-initial subject *Roman* is indicated by prosody alone (18).

(13') DECLARATIVE

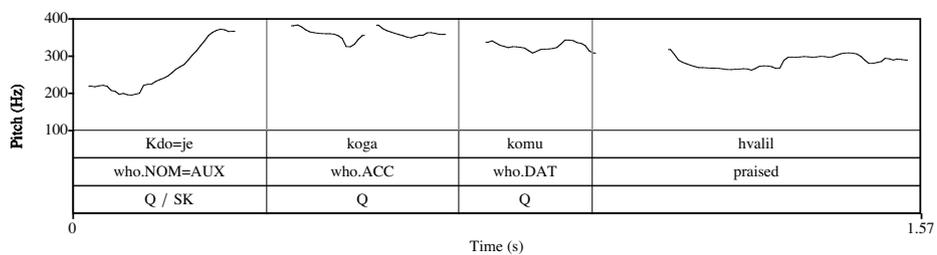

(18) DECLARATIVE WITH CONTRASTIVE FOCUS (PROSODIC)

Next, compare the pitch-tracks in (13') and (18) with that of the multiple CQ (14'), which includes multiple Questioning Foci.

(14') MULTIPLE CQ

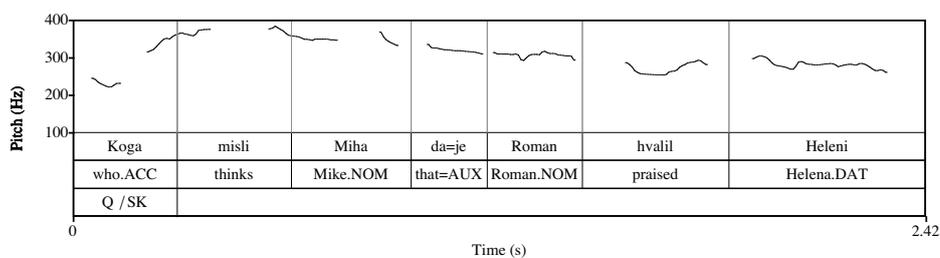

In a multiple CQ such as (14'), Questioning Focus is realized syntactically via fronting in all cases (Section 3.2). However, the question words involved are not identical in prosodic terms: the first question word, which also has Sorting Key status, is prosodically prominent. Thus, the Sorting Key is marked by prosodic and syntactic means in this language.

These data also show that the prosodic prominence of the Sorting Key in a CQ need not manifest itself in the same way as Contrastive Focus (18). Though each prominent constituent in (14') and (18) is followed by a plateau, in the CQ (14') the plateau is high, while in the declarative (18) the plateau is low. In both cases, relative discourse salience (i.e. focus/non-focus status) appears to correlate with the relative size of the pitch range, but the height of the plateau may differ.

As in Hungarian, the period of pitch range variation initiated by the Sorting Key correlates with the scope of interrogativity in a matrix CQ such as (16').

(16') MATRIX CQ (LONG-DISTANCE DEPENDENCY)

To summarize, in a multiple CQ such as (14'), Questioning Focus is expressed by syntactic means, while simultaneous prosodic focusing indicates Sorting Key status.

#### 4.3 *English*

The clause-initial question word in a multiple CQ like (17b) is not prosodically prominent (Bartels 1999; Culicover & Rochemont 1983: 130; Zubizarreta 1998; inter alia). This has been presented as a surprising fact, given the assumption that a question word should be the focus of a CQ (e.g. Ladd 1996: 170-1).

However, it seems that in the case of English CQ formation there is a division of labour with respect to marking Questioning Focus status. In Section 3.3, it was noted that the clause-initial question word occupies a position consistent with syntactic focusing, thus it is marked as an instance of Questioning Focus in the syntax. This contrasts with the other, 'in-situ' question words in a multiple CQ which show no such evidence of syntactic focusing, but which are prosodically prominent to some degree (Bartels 1999; Zubizarreta 1998; inter alia). English CQ formation thus involves non-simultaneous Questioning Focus at the levels of syntax and prosody.

#### 4.4 Data summary

The generalizations which can be made about the role of prosodic focusing in CQ formation, as exemplified by the three case-study languages, are summarized in Table 2.

TABLE 2. The relationship between prosodic focusing and the strategies used to form multiple CQs in the three case-study languages.

PROSODICALLY FOCUSED QUESTION PHRASE(S)	CASE-STUDY LANGUAGE
Sorting Key only	Slovene
multiple, excluding Sorting Key	English
multiple	Japanese

It is interesting to note that even in a language such as Slovene, which employs a CQ formation strategy involving syntactic marking of Questioning Foci, prosody makes a unique contribution, viz., the marking of Sorting Key status. Such data reinforce the point that the interface between prosody and Information Structure should not be overlooked, even when a language appears to employ morphology and/or syntax extensively to mark the discourse status of constituents.

## **5 A non-derivational approach to CQ formation**

In order to capture the descriptive generalizations discussed in Sections 3 and 4, I adopt a parallel constraint-based architecture. The levels of representation each express a different type of linguistic information with its own primitives and rules. Under a parallel architecture approach, such as that outlined in Figure 1, the semantic/pragmatic property of being focused is distinguished from its realization at other levels of linguistic structure, the relevant levels being interfaced by mappings between the different modules (e.g. Jackendoff 2002).

FIGURE 1. Extract of a parallel architecture of language, including only those levels of linguistic structure, primitives and mappings which are relevant to the proposed analysis of CQ formation.

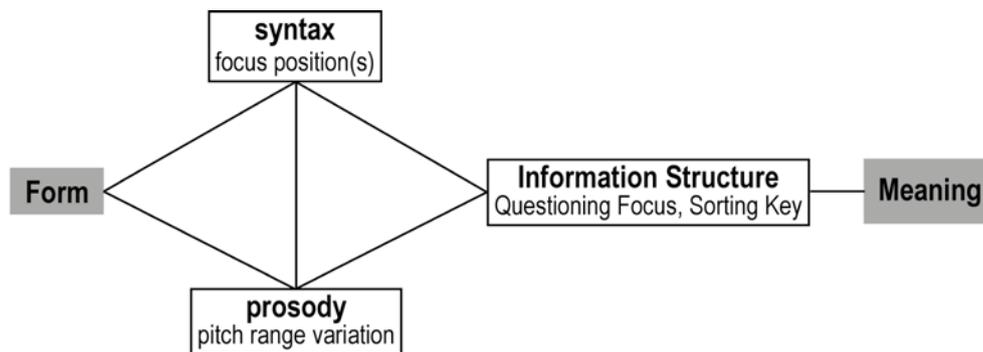

Figure 1 also includes the features of linguistic structure (Questioning Focus, Sorting Key status, pitch range variation, syntactic ‘focus’ position(s)) which are relevant to CQ formation as described in Sections 3 and 4. Through the interfaces which exist between each independent level of linguistic structure, the requirements for marking of Questioning Focus and Sorting Key status may be satisfied in a number of different ways.

## **6 Focus and the typology of CQ formation strategies: inter- and intra-language variation**

Given the syntactic and/or prosodic correlates of Questioning Focus and Sorting Key status, and the type of parallel architecture described in Section 5, it is possible to define the typological space relevant to CQ formation strategies. Under such an approach, strategies are treated as equivalent but not identical and therefore inter- and intra-language variation is expected.

In Sections 3 and 4, data revealed that CQ formation in the case-study languages crucially varies along two parameters with empirically observable correlates: marking of (i) Questioning Focus and (ii) Sorting Key status at some level(s) of linguistic structure. (Note that the latter is dependent on the former: for instance, in a MSF language all Question Foci will be syntactically focused, hence the Sorting Key could not be subject to prosodic focusing alone.)

Each of the case-study languages exemplifies one of the types of CQ formation strategies, defined in terms of Variable 1, in Table 3.

TABLE 3. The typological space for CQ formation strategies defined in terms of Variable 1: the type of strategy/strategies used to mark the focus status of question words.

	SYNTACTIC	PROSODIC
SYNTACTIC	Multiple syntactic focusing (MSF): Slovene	Single syntactic focusing (SSF): English
PROSODIC	Single prosodic focusing (SPF): ?	Multiple prosodic focusing (MPF): Japanese

I have not yet identified a SPF language. It may be that the relative markedness of focusing strategies precludes such languages. Syntactic focusing establishes at least one long-distance dependency and thus involves greater processing complexity than prosodic focusing, making it an unlikely ‘secondary’ focusing strategy (i.e. of non-Sorting Key question phrases).

If the definition of the typological space relevant to CQ formation strategies provided in Table 3 is enriched by adding details of how Sorting Key status is marked, a more fine-grained picture of possible variation is obtained (Table 4).

TABLE 4. The typological space for CQ formation strategies defined in terms of Variable 1 (marking of Questioning Focus; see Table 3) and dependent Variable 2 (marking of Sorting Key status).

VARIABLE 1	VARIABLE 2	EXAMPLE LANGUAGE(S)
MSF	SK: SYNTAX	Imbabura Quechua (Cole 1982)*
	SK: SYNTAX & PROSODY	Hungarian, Slovene
MPF	SK: PROSODY	Japanese
SSF	SK: SYNTAX	English (Ginzburg & Sag 2000)*
	SK: SYNTAX & PROSODY	Rapanui (Du Feu 1996)*

\*Author provides only impressionistic account of prosody

A striking consequence of this approach is that, rather than the core case, the type of CQ formation strategy used in English emerges as a hybrid of MSF and MPF, involving as it does elements of both. The SSF CQ formation strategy is situated at the intersection of two logically independent but complementary strategies. In no sense is SSF – or syntactic focusing – the only or even the primary means by which Question Focus

status (or indeed Sorting Key status) can be expressed. Information Structure primitives, which are key to CQ formation, may be marked by different but equivalent means cross-linguistically.

This approach to inter-language variation extends straightforwardly to cases of intra-language variation, such as that found in Persian. Lotfi's (2003) examples indicate that the three types of CQ formation strategies discussed above are legitimate in Persian. This is expected under the proposed analysis, as CQ formation strategies do not represent 'optional' versions of each other. Each strategy represents a fundamentally equivalent, but not identical, means of meeting the same ends.

## **7 Conclusion**

Analysis of spoken and written data reveal two key, empirically observable variables which account for some of the similarities and differences in CQ formation strategies employed cross-linguistically.

Assuming a parallel architecture of grammar, the relevant typological space can be defined in terms of the expression of Questioning Focus status (prosodic, syntactic, prosodic and/or syntactic) and Sorting Key status (prosodic, syntactic, prosodic and syntactic). Inter- and intra-language

variation is expected, as each CQ formation strategy represents a different means to the same ends.

The proposed non-derivational, typologically-informed approach to CQ formation not only provides a new perspective on CQs in natural language, it simultaneously sheds light on focus, its expression, and its relevance to linguistic theory.

<sup>1</sup> This work was supported by Arts & Humanities Research Council award 2003/101814, a University of Manchester Faculty of Humanities Fellowship, and a British Academy Postdoctoral Fellowship. I would like to thank the informants consulted; Juri Tanaka; Mária Gósy, Alexandra Markó, Lenka Meszler, Gabór Olaszy, Tamás Péter Szabó, and the Kempelen Farkas Speech Research Laboratory of the Research Institute for Linguistics, Hungarian Academy of Sciences, Budapest; Darja Hoenigman, Albina Nećak Lük and the Department of Comparative and General Linguistics, Ljubljana University; Mary Dalrymple, Nigel Vincent, and those who attended CIL18 and provided insightful comments and questions.

<sup>2</sup> I confine discussion and analysis to matrix CQs which contain one or more non-adjunct question words, and multiple CQs with regular pair-list answers.

---

<sup>33</sup> Unless stated otherwise, data were collected by the author. Each pitch-track represents one utterance produced by a single speaker, but that pitch-track exemplifies the general pattern identified. Informants read all CQs from a script. The Japanese informant is a native speaker of Tokyo Japanese; the four Hungarian informants were born and raised in Budapest; the four Slovene informants were born and raised in Ljubljana.

<sup>4</sup> Though I do not examine morphology in this paper, the proposed approach to the typology of CQs extends straightforwardly to include those languages in which question phrases are morphologically marked as focused.

<sup>5</sup> Dik's (1997: 331) taxonomy subdivides focus on the basis of a binary [ $\pm$ CONTRAST] feature. Information Gap Focus cannot be [-CONTRAST] though as this would rule out, for example, contrastive focusing of question words (i.e. Questioning Focus) in a sentence such as (7b). The distinction between Information Gap and Contrastive Focus should not, therefore, be conceived of as involving mutually exclusive alternatives.

<sup>6</sup> As well as the Sorting Key, this question phrase has also been identified as a topic (Bolinger 1978: 133) and First Focus (Jackendoff 2002: 414).

<sup>7</sup> As Sorting Key status is marked even in a single CQ like (10), it may ultimately be preferable to subsume this notion under a more general definition of interrogative scope marking. See Mycock (2006).

<sup>8</sup> The Japanese referred to in this paper is the standard variety, based on the Tokyo dialect.

---

<sup>9</sup> Contrast this with the presence of the question particle itself, which is not obligatory (Hinds 1986: 7).

petra.burkhardt@aya.yale.edu

## Abstract

This paper presents a series of psycholinguistic experiments on the given-new contrast that indicate that givenness and newness are not two sides of the same coin, but represent two rather distinct information structural processes. The paper introduces two separate processes: *Dependency and coherence* (which is primarily related to notions of givenness) and *IS complexity* (which reflects facets of newness). These two processes are tied to two dissociable event-related brain potentials, an N400 and a late positivity respectively. The data further indicate that *Dependency and coherence* relies on lexical-semantic and discourse-level factors, but is also affected by structural accessibility and prominence features. Similarly, *IS complexity* depends on a variety of linguistic factors, such as morphological features and argument structure.

**Keywords:** given-new contrast, referential processing, ERPs, N400, late positivity.

## 1. Givenness and newness: Two dissociable mechanisms

One of the central notions of information structure research is the given-new contrast that distinguishes referential entities on the basis of their salience / discourse status within a given situation (cf. Halliday 1967; Chafe 1976; Prince 1981). This informational status impacts the way information is packaged, which is for instance reflected in word order variations (given-before-new preference) or the use of certain referential forms (e.g. pronoun vs. definite description) (cf. e.g. Lambrecht 1994; Birner and Ward 1998).

The given-new contrast has been viewed as a one-dimensional continuum (sometimes even a dichotomy) on the basis of givenness. For example in Chafe (1976), given information is information that is already present in the addressee's consciousness, while new information must be introduced into his/her consciousness (and into information structure (IS)). Givenness thus indicates that the discourse referent of an

expression is somehow accessible in IS. However, givenness is a gradual dimension, comprised of many degrees of salience, for instance an entity can be maximally known in a given discourse, be inferred from world knowledge, or represent an inherently given concept (such as *the earth* or *the time*) (see for instance the typologies of Prince 1981 or Gundel, Hedberg and Zacharski 1993). In addition, it is suggested in the following that newness should not be situated at one end of this continuum (i.e. 'not givenness'), but rather be considered a qualitatively different notion of IS. This paper presents experimental evidence from electrophysiology that indicates that the notion of givenness can be dissociated from newness and that this contrast gives rise to two distinct processes: an integrative process that seeks to establish links with information already available in the IS representation ("Coherence & dependency"), and a process that enriches and reorganizes the information in IS ("IS complexity"). These two processes are briefly outlined immediately below.

### *1.1. Coherence and dependency*

This stage of integration adheres to an early processing stage during which incoming information is related to knowledge already available in IS. Driven by *IS Minimality* (i.e. "Keep the information structure minimal and simple.") and the general desire to construct coherent interpretations, the processing system attempts to establish links and to bind incoming information to currently available or activated information.<sup>1</sup> The investigations discussed below reveal that computational cost arising from difficulties during the formation of a dependency or the establishment of coherence is reflected in amplitudinal modulations of the N400, a negative potential peaking around 400 ms after the onset of a critical stimulus event (see section 3 for an overview of electrophysiological experimentation).

### *1.2. IS complexity*

In a distinct processing phase, IS complexity arises from the introduction of new IS units (i.e. new discourse referents or event representations) or the modification of previously established information on the basis of semantic-thematic mapping or

---

<sup>1</sup> For present purposes, I do not distinguish between categories such as activated, accessible, familiar, etc. (cf. e.g. Prince 1981; Ariel 1990; Gundel et al., 1993). Future research has to determine the principle concepts that govern givenness.

pragmatically motivated restructuring. The computational burden associated with these processes engenders a late positivity with an onset latency around 600 ms after stimulus onset (see section 3 for further details).

## **2. Inferrables: Window into the given-new distinction**

In addition to the obvious examination of given (repeated) Determiner Phrases (DPs) and discourse-new DPs, inferrables are investigated, because entities that invite an inference are hypothesized to share properties with both given and new information: they demand a dependency with previously given information (by virtue of definiteness marking, but possibly also due to general coherence requirements – see the experiment discussed in section 3.2 for the role of definiteness features) - e.g. *the pilot* in (1) below is considered *the pilot of the sightseeing flight*. Nevertheless, an inferrable also represents a new discourse referent that requires its own, independent IS representation, thereby inducing processing demands on what I call IS complexity.

- (1) Nina went on a sightseeing flight. *The pilot* was almost deaf.

Inferrables hence represent a promising starting point to identify the processes underlying the integration of given and new aspects of information.

Previous psycholinguistic research has demonstrated that inferrables exert processing cost relative to the establishment of a coreferential relationship (cf e.g. Haviland and Clark 1974). However, from these reaction time measures, it is not clear whether the observed processing demands are caused by the need to draw an inference (vs. the availability of an identity relation) or by the need to introduce a new discourse referent. This can be addressed by time-sensitive event-related brain potential (ERP) measures.

## **3. Information Structure & Electrophysiology**

ERPs represent voltage fluctuations that reflect the brain's spontaneous electrical activity, which occurs in response to a sensory or cognitive stimulus event and is measured non-invasively by electrodes applied to the scalp. ERPs provide a high resolution of the time course of processing and are further characterized by their

polarity (negative or positive voltage fluctuations), amplitude (magnitude of response), and topography (maximum activity relative to scalp position). Importantly, ERPs are *relative* measures, i.e. an ERP response is interpreted relative to the response to a minimally differing baseline condition. See Kutas, van Petten, and Kluender (2006) for detailed explications of the ERP methodology and language-related findings.

The following two ERP signatures are predicted for the two processes introduced above: The difficulty of processes associated with *Coherence and dependency* should be reflected in a negative-going deflection peaking in amplitude around 400 ms after stimulus onset that shows a broad centro-parietal distribution across the scalp (N400). This ERP signature generally surfaces in connection with semantic processing. The more difficult the establishment of a dependency relation or association is, the more enhanced is the amplitude of the N400 component. This has been shown extensively for lexical-semantic processing where the N400-amplitude is inversely related to the degree of plausibility and coherence (for an overview see Kutas and Federmeier 2000; Kutas et al. 2006). With respect to referential processing, the amplitude of the N400 has also been correlated with the ease/difficulty of referent identification (see e.g. Streb, Rösler and Hennighausen 1999; Burkhardt 2005, 2008). Processing cost arising from increasing *IS complexity* is expected to show up as a positivity with an onset latency around 600 ms post stimulus-onset. This is supported by findings from the establishment of new information units (cf. Kaan, Harris, Gibson and Holcomb 2000; Burkhardt 2005; Kaan, Dallas and Barkley 2007). I use the label ‘late positivity’ – rather than P600 – for this component to dissociate myself from the inaccurate belief that the underlying source of the P600 is exclusively syntactic in nature (but see Burkhardt 2007 for an extensive discussion of this matter).

In the following sections, four event-related brain potential experiments will be reviewed that were part of a systematic investigation of information structural processing (carried out at the Max Planck Institute for Human Cognitive and Brain Sciences, Leipzig, Germany and at the University of Marburg, Germany, and in part supported by the German Research Foundation (Deutsche Forschungs-gemeinschaft)). These studies investigated the processing of the given-new contrast and they i) provide evidence for a qualitative distinction between given and new integration processes and ii) reveal that varying sources of information influence the integration of given and new information.

### 3.1. Given – inferred – new

Initial evidence for distinct neural correlates of the given-new contrast was presented in Burkhardt (2006), which investigated the processing of given (2a), inferred (2b) and new DPs (2c) as a function of the information provided by a context sentence.<sup>2</sup> While the processing of the critical DP in (2a) should yield a coreferential relation, (2b) requires the drawing of an inference (that we are talking about the conductor of the previously mentioned concert), and (2c) does not provide an anchor for a linking relationship.

- (2) a. Tobias visited a conductor in Berlin. He said that *the conductor* was very nice.
- (2) b. Tobias visited a concert in Berlin. He said that *the conductor* was very nice.
- (2) c. Tobias chatted with Nina. He said that *the conductor* was very nice.

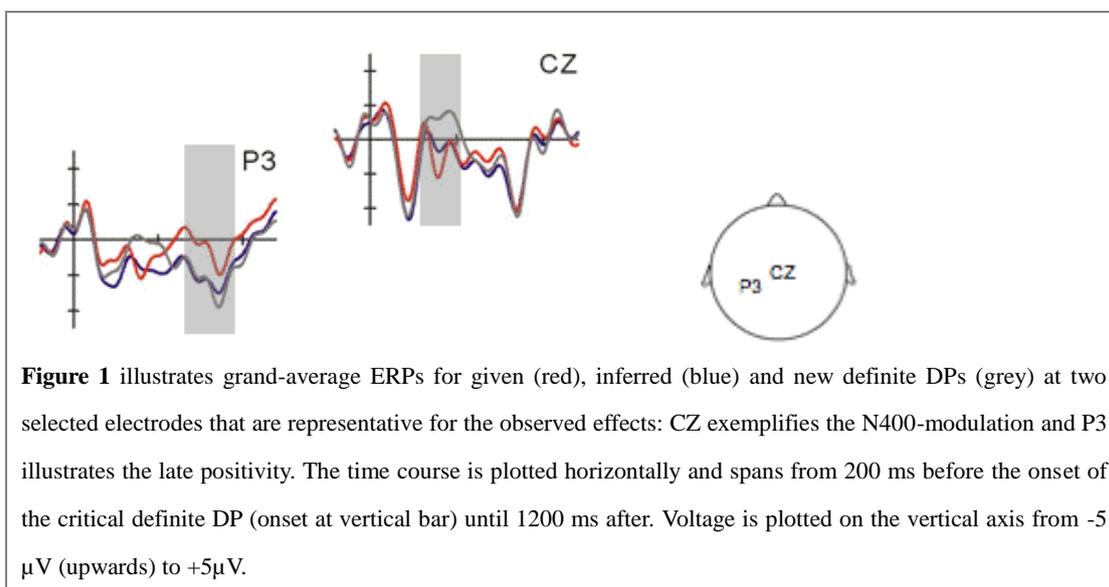

The ERP analysis revealed differences in the N400-signature, a negative-going potential between 350-550 ms after the onset of the critical DP: The less given an entity was, i.e. the more difficult the establishment of a dependency was, the more pronounced was the amplitude of the N400 (2c>2b>2a). In addition, a late positivity between 600-900 ms was observed for inferrables and new DPs, which – in the absence of a matching referent – require the introduction of an independent IS representation (2b/2c>2a). Note that acceptability judgments cannot account for the observed contrasts. Inferrables occur frequently in everyday conversation (cf. e.g. Fraurud 1990 and Poesio and Vieira 1998 for corpus data from written texts) and stimuli with inferrables were rated more felicitous than texts with repeated DPs. In fact, passages with inferrables represent ideal means of information flow since they allow for thematic continuation while at the same time they contribute to the progression of the text by introducing new information. Figure 1 illustrates the two ERP signatures at two selected electrode sites, which are

---

<sup>2</sup> For reasons of space, all examples are given in English. Note however that the experiments discussed here were conducted in German and that the critical regions - to which ERPs were time-locked - are italicized. In all experiments, participants were required to read the passages for comprehension (presented word-wise (3.2) or phrase-wise (3.1, 3.3, 3.4) with a fixed presentation rate). Further experimental details can be found in Burkhardt (2006, 2007) and Burkhardt and Roehm (2007).

representative for the observed effects: CZ, an electrode placed at the center of the scalp (see the head on the right side for a schematic position of the electrode), demonstrates the three-way contrast in the N400 signature (which generally shows a broad centro-parietal distribution across the scalp) and P3 demonstrates the late positive effect (which emerged over left posterior electrode sites).

The N400-modulation supports the claim that givenness is a gradual dimension, which here ranged from a (highly given) coreference relation to an indirect inference-based relation to no potential relation at all. Furthermore, the late positivity for inferred and new DPs indicates that processes subserving givenness - or more precisely, the ease of coherence and dependency formation - must be dissociated from those resulting in increasing IS complexity (newness).

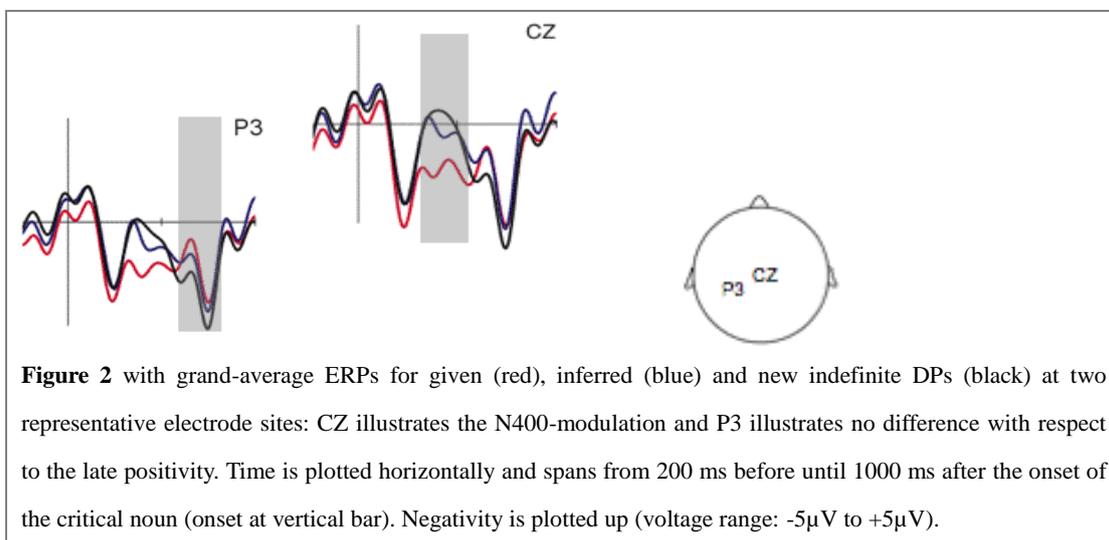

### 3.2. Definite - indefinite

Givenness is often discussed with respect to definiteness, in as far as definiteness marking is taken to imply that the corresponding discourse referent is identifiable or that its existence must be presupposed. While there is a long tradition of characterizing definiteness with respect to truth conditions and linking it to the notion of referential uniqueness (e.g. Russell 1905; Strawson 1950), the focus lies on salience, discourse prominence and familiarity as crucial characteristics of definiteness within an information structural perspective (e.g. Lewis 1979; Prince 1981; Heim 1982). To shed light on the contribution of definite and indefinite determiners, a follow-up study investigated the processing of definite (2a-c) and indefinite DPs (3a-c). Based on a strict

correspondence between indefiniteness and newness, the prediction was that irrespective of the preceding context sentence, indefinite DPs should be identified as new discourse referents and processed accordingly.

- (3) a. Tobias visited a conductor in Berlin. He said that a *conductor* was very nice.
- (3) b. Tobias visited a concert in Berlin. He said that a *conductor* was very nice.
- (3) c. Tobias chatted with Nina. He said that a *conductor* was very nice.

ERPs time-locked to the onset of the noun revealed a reliable effect of givenness in the N400-window, which was reflected in an increasing N400-modulation for (2/3a<2/3b<2/3c). Thus the amplitudinal modulations of the N400 component occurred irrespective of definiteness marking. In addition, a significant effect was observed in the late positivity window, where all conditions except for (2a) registered a positive-going deflection – which becomes evident when all six conditions are compared with each other. The effects for definite DPs resembled those presented in Figure 1 and the ERP effects for indefinite DPs are exemplified in Figure 2.

First, the finding that increases in the amplitude of the N400 correlate with decreasing associative power of the noun is somewhat surprising for classical theories of definiteness, but not necessarily for (discourse-)semantic processing accounts. The data indicate that there is no clear 1-1-mapping between the given-new dichotomy and the definite-indefinite distinction (contra e.g. Heim 1982). Rather, the parser considers

previous IS information regardless of a DP's definiteness features and seeks to establish links with information already available in the information structure in order to achieve a coherent interpretation. Yet, the exact nature of this process of coherence and dependency formation cannot be decided upon on the basis of these data. On the one hand, the N400-modulations (given<inferred<new) for both definite and indefinite DPs might be guided by discourse-pragmatic factors (i.e. reflecting different degrees of difficulty during dependency formation), but on the other hand they could also be mere reflections of lexico-semantic processing (i.e. facilitation through priming). This issue will be addressed in section 3.3 and 3.4.

Second, a late positivity emerged for indefinite DPs (3a/3b/3c) and in the absence of an identity relation (2b/2c), suggesting that information structural complexity is heightened by the need to establish an independent representation. It also insinuates that indefiniteness marking affects processing decisions after semantic networks have been activated (reflected by the N400-modulations) and crucially cannot suppress or block these latter processes. As an aside, acceptability ratings again cannot explain the late positive ERP effect. Although the conditions in (3) represent the least acceptable mini-discourses discussed in this paper, a consistent explanation of the data on the basis of offline measures – that show clear differences between the three indefinite conditions - cannot be reached.

Finally, with respect to the time-course of the given-new distinction, the results of this and the previous investigation reveal that access to lexical-semantic and/or information structural knowledge impacts interpretive processes prior to the creation of an independent referent representation in IS. Most importantly, (in)definiteness does not influence early processing phases, indicating that there is no automatic correspondence between the given-new contrast and the definite-indefinite distinction.

### *3.3. Structural accessibility*

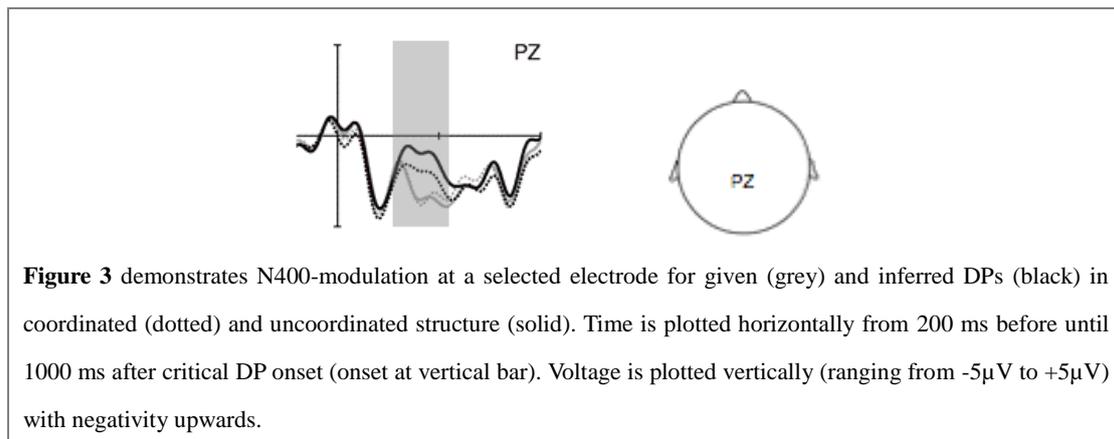

The issue of the underlying source of the N400 differences has been addressed by a study that investigated the accessibility of a referent via coordinated and uncoordinated context sentences (Burkhardt and Roehm 2007). Such an experimental manipulation may provide an answer to the question whether the N400 modulation observed for given and inferred entities is triggered by processes of dependency formation or whether it reflects mere lexical-semantic facilitation. To this end, the study asked how information is accessed in IS and which factors may facilitate or block this access by comparing stimuli as in (2a-b) (repeated below) with those in (4a-b) where the

antecedent/anchor expression is embedded in a coordinated structure:

- (2) a. Tobias visited a conductor in Berlin. He said that *the conductor* was very nice.
- (2) b. Tobias visited a concert in Berlin. He said that *the conductor* was very nice.
  
- (4) a. Tobias visited a conductor and a politician. He said that *the conductor* was very nice.
- (4) b. Tobias visited a concert and a horse race. He said that *the conductor* was very nice.

Acceptability ratings improved for the repetition of a given DP when the antecedent expression was embedded in a coordination as in (4a); the fact that the two DPs in the context sentence are of equal salience makes it necessary to use a full DP in the subsequent sentence. Contrary to this, acceptability declines in the case of the inferrables; while (2b) represents a highly acceptable and coherent sequence, it is difficult to establish a formal association between *conductor* and *concert*, since the potential anchor forms a higher-order constituent with the second conjunct. These behavioral findings are only partly reflected in the ERP data. In Burkhardt and Roehm (2007), we found no differences between the two given variants (2a=4a), which indicates that the described differences in offline judgments are not reflected in the ERP signal elicited during the establishment of coreference relations. In contrast, differences in the accessibility of the anchor for inferential dependencies are reflected in the N400-amplitude, with an enhanced N400 for less accessible (coordinated) structures (4b>2b). This negativity is illustrated in Figure 3 at a representative electrode position.

These data reveal that inferential integration is more resource-consuming when the anchor is part of a complex coordination structure than a simple DP, while given DPs are unaffected by the degree of accessibility of their antecedent. The data demonstrate further that both the type of dependency and factors associated with the antecedent expression impact IS integration, i.e. salience or prominence information influences information structural processes in different ways. This observation thus represents an initial indication that the previously reported N400-modulations are triggered by IS processes and go beyond lexical-semantic facilitation.

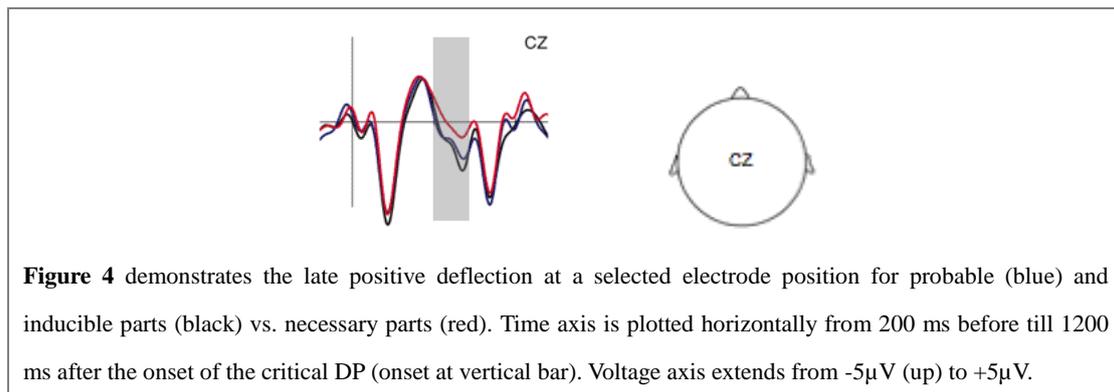

### 3.4. Thematic accessibility

Further corroborating support for an information structural account of the N400 comes from an investigation of the semantic-thematic accessibility of the antecedent expression. In Burkhardt 2007, I reported on an investigation that varied the strength of the required inference – based on Clark’s (1975) distinction between necessary (5a), probable (5b), and inducible parts (5c). The idea is that the amount of computational effort needed to construct a coherent interpretation rises successively; while for example a pistol is a necessary part in a shooting event (5a), killing can also be carried out with a rope, a knife, one’s hands (5b), and establishing a link between a finding-dead event and a pistol involves drawing the inference that the death was inflicted upon the Ph.D. student (5c).

- (5) a. Yesterday a Ph.D. student was shot downtown. The press reported that *the pistol* was probably from army stocks.
- (5) b. Yesterday a Ph.D. student was killed downtown. The press reported that *the pistol* was probably from army stocks.
- (5) c. Yesterday a Ph.D. student was found dead downtown. The press reported that *the pistol* was probably from army stocks.

The ERP analysis registered no N400-differences, but yielded a reliable effect in the late positivity window, which was reflected in a more pronounced positivity for (5b/c). This is illustrated in Figure 4 at a selected electrode site.

First, the absence of distinct N400 effects suggests that lexico-semantic networks are initially activated in all conditions alike, although behavioral data from a rating study indicate a three-way plausibility contrast ( $5a > 5b > 5c$ ). The discrepancy between offline and online data therefore indicates that the two-way contrast in the ERP study cannot be exclusively attributed to the fit of sentence pairs and strength of lexico-semantic association and plausibility. Instead, it insinuates that the N400 taps into processes of dependency formation, where the type of dependency modulates amplitudinal variation along the following continuum: identity < inference < no dependency.

Second, the late positivity for probable and inducible parts over necessary parts strengthens the view that this component is evoked by increases in IS complexity. Here, IS complexity is not merely affected by the creation of an independent IS representation of the instrument role (as e.g. discussed in section 3.1 and 3.2), which is required in all three conditions alike. Rather, the critical DPs in (5b/c) force the modification of a previously established event representation, i.e. the finding-dead event in (5c) must be reinterpreted as a shooting event and/or an additional IS representation for the instrument role must be created. In contrast, one can argue that the critical DP in (5a) represents an implicit instrument role in the shooting event. Following this line of reasoning, the late positivity can thus be interpreted as enhanced semantic-thematic integration cost.

#### **4. Coherence and dependency vs. IS complexity: Two dissociable mechanisms**

The electrophysiological data presented in the previous section indicate that givenness and newness are not two sides of the same coin, but rather represent

dissociable processes during discourse comprehension. While givenness is affected by factors such as coherence, accessibility, and the type of dependency available, newness is not just an opposing notion, but instead triggers an independent process that results in an increase in information structural complexity and is guided by morphological marking (indefiniteness), semantic-thematic demands and pragmatic enrichment (the latter is supported by recent research on reference transfer as in the famous ‘ham sandwich’ example (see Schumacher 2009 for further details)). Processes associated with the establishment of *Dependency and coherence* are reflected in N400-modulations, whereas a late positivity emerges for *IS complexity*. This distinction converges with previous ERP findings that showed that the N400 reveals difficulty of lexical-semantic and referential integration (cf. e.g. Streb et al. 1999; Kutas and Federmeier 2000) and that enhanced processing demands during integration and storage of new IS units are reflected in a late positivity (e.g. Burkhardt 2005; Kaan et al. 2007). Yet, the present paper shows in a systematic manner how given and new information is computed in real time. It proposes a comprehensive account of IS processing and reveals that information from distinct linguistic domains facilitates and constrains IS processes.

The data demonstrate that *Dependency and coherence* relies on lexico-semantic support, but is also contingent on the type of the dependency since this notion emerges as a stronger indicator for the amplitude of the N400 than lexical-semantic facilitation – as evidenced by the absence of N400 differences in section 3.4 and the fact that prominence yields dependency-specific effects in section 3.3. Note that type of dependency is viewed as an information structural notion because it has clear consequences for IS representation. The findings further reveal that *Dependency and coherence* is also constrained by prominence features such that the structural prominence of an antecedent/anchor determines the ease of integration in certain cases. Future research should further specify which other types of prominence features have an impact on referential processing (cf. e.g. Gordon, Grosz and Gilliom 1993 or Almor 1999 for evidence from other experimental paradigms).

Processing cost from *IS complexity* in turn arises whenever information units are created or modified in IS. This is not only caused by the introduction of new discourse referents, but also when already established IS units must be enriched. As the data indicate, the introduction of a new referent is triggered by indefiniteness marking, but also takes place when no coreferential unit is available in IS. In addition, the findings discussed in section 3.4 reveal that initial mismatches in the semantic-thematic mapping between incoming information and previous IS representations result in *IS complexity* cost, i.e. unexpected thematic roles require the restructuring of IS representations

thereby exerting processing demands. Moreover, an alternative explanation of the late positivity with respect to plausibility judgments cannot account for the observed patterns in a consistent manner, which is briefly discussed in each subsection above. This claim is for instance guided by the observation that the basic inferable condition (e.g. (2b)) represents the most felicitous mini-discourse, yet shows a clear positive deflection compared to the coreference condition (2a). Furthermore, the indefinite new condition (3c) represents a plausible mini-discourse, yet it does not differ from the other two indefinite conditions with respect to the late positivity.

Overall, these investigations of inferences demonstrate that processes that are associated with linking incoming information with previously established information precede those processes that involve adding or updating information in IS, supporting the widely assumed sequencing of given-before-new. Thus the information transfer is optimized by the parser by first attempting to enter into dependencies with known information before creating or altering already existing IS units. Finally, I want to suggest that the process *Dependency and coherence* is guided by the general IS principle of *IS Minimality* (“Keep the information structure minimal and simple.”) whereby coreference relations are highly preferred and coherence is aspired for (cf. e.g. Asher and Lascarides 1983’s principles *Use Identity* and *Maximize Discourse Coherence*). Moreover, *IS complexity* generally results from conflicting information types such as mismatches between lexical-semantically possible dependencies and referential features (indefinites) or mismatches in argument structure.

# Second Occurrence Focus in German

Stefan Baumann, Doris Mücke & Johannes Becker

IfL Phonetik, University of Cologne  
Herbert-Lewin-Str. 6, 50931 Cologne, Germany  
{stefan.baumann;doris.muecke;becker.johannes}@uni-koeln.de

## Abstract

In a production study on read German, we investigate the tonal, durational and articulatory parameters used in the marking of three different focus structures. Special attention is paid to target words in Second Occurrence Focus (SOF). Such words are both focussed and contextually given. Prominence in SOF items is compared to prominence in items which are focussed and new (First Occurrence Focus, FOF) and those which are in the Background. Results confirm previous findings that SOF is not marked by a pitch accent. However, we observe gradient but systematic adjustments of acoustic and articulatory parameters (word durations and temporal and spacial modifications of opening and closing gestures) leading to an increase in prominence from Background through SOF to FOF. The extent to which single speakers employ different strategies varies. Phonologically, we propose an analysis of SOF prominences as phrase accents.

**Keywords:** Second Occurrence Focus, articulatory gesture, prominence, sonority expansion, prosody.

## 1. Introduction

Recent production studies on the prosodic marking of different types of focus (contrastive vs. non-contrastive) as well as different sizes of focus domain (broad vs. narrow) in German revealed that speakers make use of a wide variety of prominence-lending cues for encoding differences in information structure (e.g. Baumann et al. 2007). Results suggest that an increase in prominence – from broad through narrow to contrastive focus – is achieved by tonal means such as rising nuclear pitch accents and higher and later accent peaks, as well as by an increase in acoustic duration and, at least for the difference between broad and narrow focus, by increased articulatory effort (localised hyperarticulation, sonority expansion) in the accented vowel.

In the study reported on here, we investigate the tonal and articulatory marking of

a specific type of focus, namely ‘Second Occurrence Focus’ (SOF). SOF is indicated morpho-syntactically by a focus sensitive operator like *only* or *even*, and is contextually given (in contrast to ‘First Occurrence Focus’ (FOF), which is contextually new). A famous example by Partee (1999: 215) is given in (1), where *vegetables* occurs as an FOF element (a) and as an SOF element (b).<sup>1</sup>

- (1) a. Everyone knew that Mary only eats [VEgetables]<sub>FOF</sub>.  
b. If even [PAUL]<sub>FOF</sub> knew that Mary only eats [vegetables]<sub>SOF</sub>,  
then he should have suggested a different restaurant.

The apparent conflict between the ‘focussedness’ and the ‘givenness’ of SOF elements in terms of their expected prosodic marking has been widely discussed and experimentally investigated in recent years (e.g. Bartels 2004, Krifka 2004, Ishihara & Féry 2006, Beaver et al. 2007, Howell 2007, Rooth 2007, Büring 2008).

The problem can be described as follows: According to *Association with Focus* theories (e.g. Jackendoff 1972), a focus sensitive operator like *only* has to be associated with a focus in its syntactic domain, which is realised by intonational prominence. However, it has been claimed (e.g. by Partee 1999) that SOF – in contrast to FOF – is not necessarily marked by a pitch accent (note the deaccentuation of *vegetables* in (1b) above). The existence of such an ‘inaudible focus’ would violate the *Association with Focus* theory, since it would imply either that focus (at least SOF) is not necessarily marked by intonational prominence OR that operators like *only* do not associate with focus.

It is important to note that the lack of prominence on SOF items cannot be explained by givenness alone, since there are many instances in West-Germanic languages in which contextually given constituents *do* receive focus prominence, as e.g. in (2), adapted from Büring (2008).

- (2) a. Who showed up last at John’s party?  
b. JOHN<sub>F</sub> (showed up last at his party).

In fact – and in contrast to Partee’s claim – several production studies have shown that SOF may be marked by prosodic prominence as well, although not by pitch accents (e.g. Bartels 2004 and Beaver et al. 2007 for American English, Ishihara & Féry 2006 for

---

<sup>1</sup> Pitch accents on relevant syllables are indicated by capital letters.

German). Instead, SOF was found to be prosodically marked by increased acoustic duration and intensity of the focussed item. For German, Ishihara & Féry found a significant durational difference between SOF and Background in postnuclear position (SOF items being longer). In prenuclear position, SOF was even marked by pitch accents.

These findings provide empirical evidence in favour of the *Association with Focus* theory. That is, SOF items *can* be considered to be focussed, and they *are* made prominent by prosodic means. However, they are not marked by fully-fledged (primary) pitch accents, but by increased duration and intensity reflecting secondary prominence or stress.

The aims of our study are the following:

- In addition to the tonal and durational marking of SOF in German, we particularly want to find out to what extent SOF is marked in articulation. That is, we investigate the modifications of the opening and closing gestures of the primary constrictors during the production of target words in three different focus structures (Background, SOF, FOF). Previous studies on SOF have not taken articulation into account.
- We want to examine whether the prominence level of SOF items lies ‘in-between’ Background and FOF items, as has been suggested by previous studies. More specifically, we want to test whether the prominence of SOF items differs from Background elements (in postnuclear position).
- Based on the outcome of our examination, we expect to gain insights into the phonological status of the prominence level of SOF elements.

## 2. Method

### 2.1 Reading materials

For our study, we constructed disyllabic target words (fictitious surnames) consisting of a 'CV:CV sequence. The open stressed target syllable contained one of the four phonologically long vowels /a:/, /i:/, /o:/ or /u:/. The structure of the target words is summarised in (3).

- (3)            **C1 V1 C2 V2**  
                  *C1, 2 = bilabial stop [b]*  
                  *V1 = [a:, i:, o:, u:]*

*V2 = open central vowel [ɐ]*

Short discourses of context and target sentences were designed with the test word in FOF, SOF or in the Background, always occurring as the last non-pronominal argument in the sentence). The sequences in (4) served as test material. We also recorded a sequence with the focus operator *sogar* ('even') but limit this report to the *nur* ('only') condition.

(4) **nur ('only') condition**

**Context:** Bei Heuschnupfen wird heutzutage viel zu schnell Cortison verschrieben.

*(Today, in case of hay fever, Cortisone is prescribed much too early.)*

**FOF:** Eine Akupunktur kann nur [Dr. Bieber]<sub>FOF</sub> machen.

*(An acupuncture can only be done by Dr. Bieber.)*

**SOF:** Auch eine Bachblütenkur kann nur [Dr. Bieber]<sub>SOF</sub> machen.

*(Also a cure with bach flowers can only be done by Dr. Bieber.)*

**Context:** Wer hat Dr. Bieber so gut ausgebildet?

*(Who trained Dr. Bieber so well?)*

**Background:** Die beste Klinik der Stadt hat [Dr. Bieber]<sub>Background</sub> so gut ausgebildet.

*(The best hospital in town trained Dr. Bieber so well.)*

## 2.2 Speakers and recordings

We recorded two native speakers of Standard German. One speaker originated from north of the Benrath isogloss (speaker DM: Low Franconian), and one from south of it (speaker WP: Central Franconian). They were aged 38 and 26 years, respectively.

All recordings were carried out at the IfL Phonetics laboratory in Cologne with a 2D Electromagnetic Midsagittal Articulograph (EMMA; Carstens AG100) and a condenser microphone (AKG C420 head set) attached to a Compact-Flash-Card-Recorder (Marantz PMD670/W1B). Articulatory sensors were placed on the vermillion border of the upper and lower lip, on the tongue dorsum (4cm behind the tongue tip) and on the jaw. Two additional sensors were placed on the bridge of the nose and on the gums of the upper incisors for calculating dynamic helmet corrections. The kinematic data were

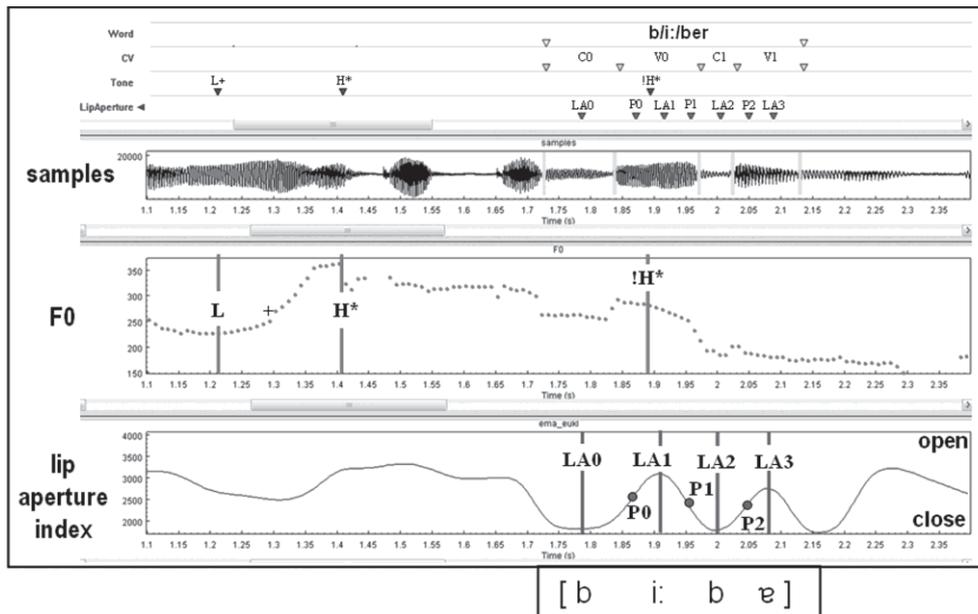

recorded at 500Hz, downsampled to 250Hz and smoothed with a 40Hz low-pass filter. The time-synchronised acoustic data were digitised at 16bit/44.1kHz. For displaying and labelling the utterances, all acoustic and physiological data were converted to SSFF-format, the format needed for the EMU speech database system (Cassidy & Harrington 2001).

A total of 336 sentences were recorded (4 target words x 3 focus structures x 2 focus particles x 7 repetitions x 2 speakers). The subjects were asked to read the speech materials from a computer monitor in a contextually appropriate manner and as naturally as possible. The sentences were presented in two blocks per condition (see (4) above). In the first block, three sentences (context, SOF, FOF) were read by the subject. The second block consisted of a context sentence, which was displayed on the screen and automatically played to the subjects as a pre-recorded audio file. The subject read the answer in this mini-dialogue.

### *2.3 Labelling procedures*

All data were displayed and labelled by hand in EMU. In the acoustic waveform, we identified segments of the target words (C0, V0, C1, V1). In the F0 trace, we annotated pitch accent types (following GToBI; see Grice et al. 2005) for pitch movements on or in the vicinity of the target words. In the kinematic waveform, we labelled vertical movements of the lips and the tongue dorsum corresponding to the 'CV:C production in the 'CV:CV-target words. Therefore, we located maxima and minima of the opening and closing movements at zero-crossings in the respective velocity traces (vertical velocity and tangential velocity), as well as peak velocities at zero-crossings in the respective acceleration trace.

Figure 1 provides an example of measure points for segmental, F0 and kinematic (lip movement) labels. As for lip movements, we calculated the Euclidean distance between the upper and lower lip (lip aperture index, LA; Byrd 2000: 6). Low displacements (LA0, LA2) indicate that lips are closed during the consonant production, while high displacements (LA1, LA3) indicate that lips are open during the vowel (P0, P1, P2 = peak velocities of the respective opening and closing movements).

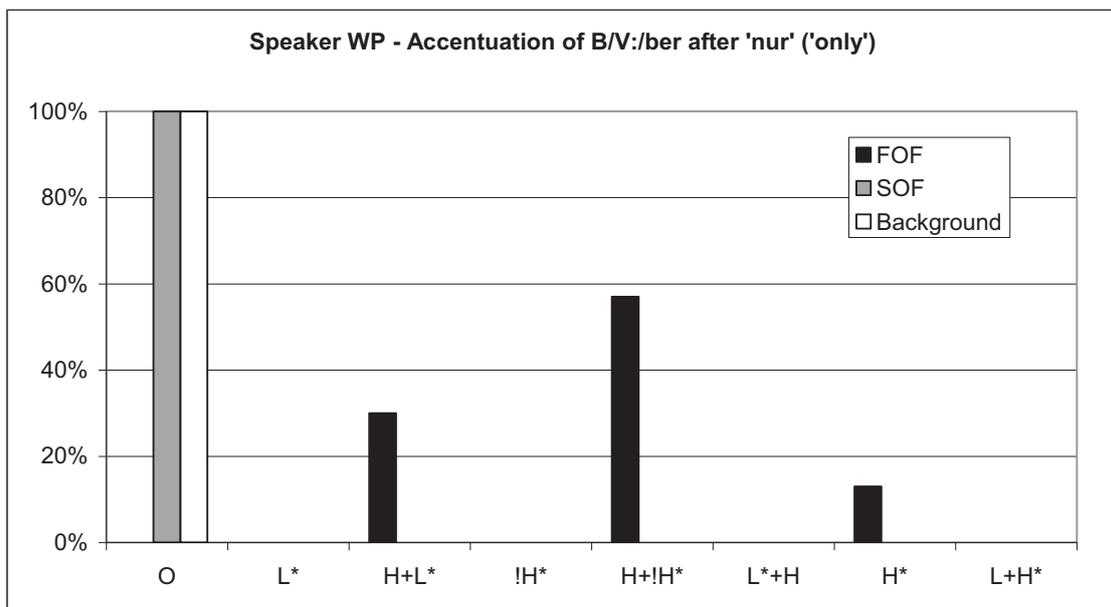

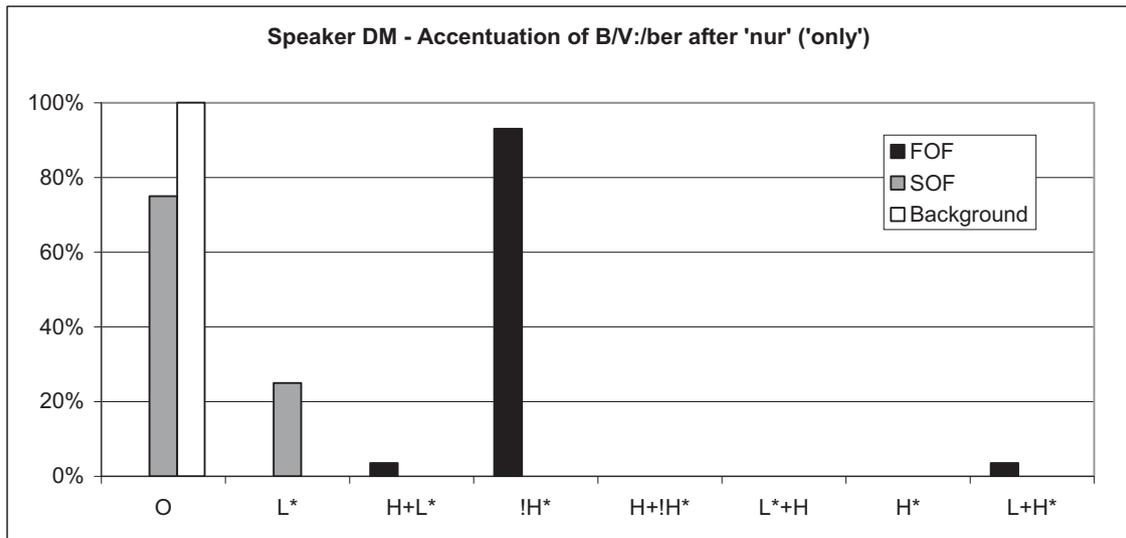

**Figure 1:** Labelling scheme with acoustic waveform, F0 trace and kinematic waveform for the lips in the second part of the test sentence [Eine Akupunktur kann] nur Dr. Bieber machen (‘[An acupuncture can] only be done by Dr. Bieber’)

### 3. Results and Discussion

#### 3.1 Tonal marking

As can be seen in Figure 2, both speakers consistently deaccented Background items. SOF target words were deaccented in 92% of all cases, with speaker DM varying between low pitch accents (7 instances of L\*) and deaccentuation. In contrast, FOF items always received a pitch accent. The choice of pitch accent varied between the speakers. Nevertheless, in 81% of all cases speakers used downstepped pitch accents (!H\* or H+!H\*).

**Figure 2:** Distribution of accent types on the target word B/V:/ber in the three focus structures (in percent), for each speaker separately

These findings support previous studies which observe that SOF items – occurring as the last argument in a sentence – are generally not marked by pitch accents. Somewhat surprising is the large number of downstepped accents on FOF items, since it has often been claimed that focussed elements which are contextually new should be marked by high or rising (i.e. H\* or L+H\*) pitch accents. However, the structure of our test sentence displaying a topicalised NP (*Eine Akupunktur...* ‘An acupuncture...’) triggers a hat pattern with a rising accent on the focus operator *nur* (‘only’) and a down-

stepped nuclear accent on the target word (see the example in Figure 1).

Although downstepped accents (as well as early peak accents) have been shown to be used to mark accessible (i.e. not new) information in German and are thus less prominent than high or rising accents (Baumann & Grice 2006), it is important to note that they are still fully-fledged (prenuclear or nuclear) pitch accents, in contrast to post-nuclear prominences such as phrase accents (Grice et al. 2000), which are secondary in nature.

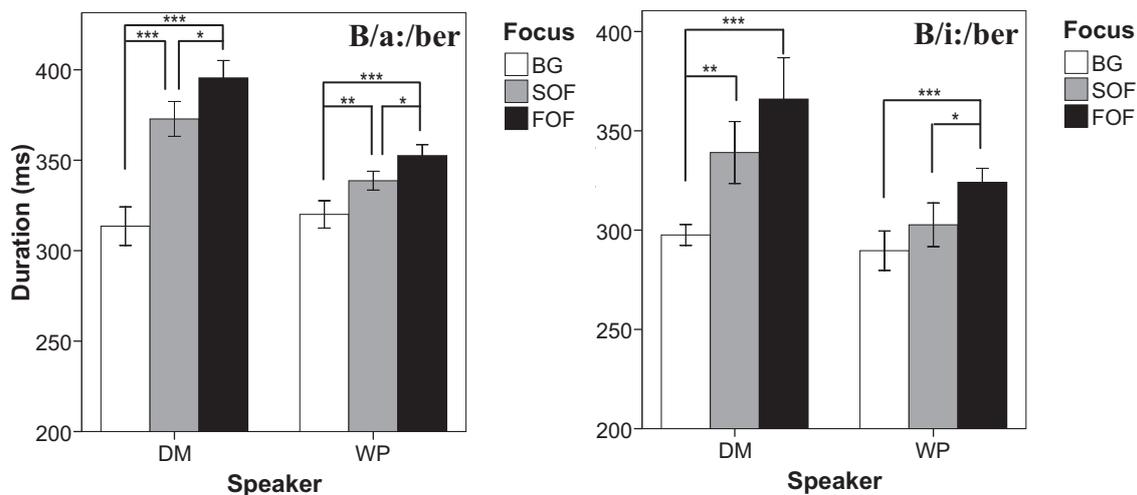

### 3.2 *Durational marking*

We investigate the durational marking of the target words containing the unrounded vowels, B/a:/ber and B/i:/ber. Note that in our study the domain ‘word’ is identical with the domain ‘foot’ since all target words are composed of two syllables with the stress pattern strong-weak. We performed speaker-individual two-way ANOVAs (2 x 3) including the factors VOWEL (B/a:/ber, B/i:/ber) and FOCUS STRUCTURE (Background, SOF, FOF). Since FOCUS STRUCTURE is a three-level factor, we also calculated post-hoc tests.

The main factor VOWEL reached significance for both speakers ( $p < 0.001$ ). We found larger word durations for the open vowels (B/a:/ber) than for the closed vowels (B/i:/ber). Averaged across both speakers those differences amount to  $\Delta = 23$ ms in the Background condition and  $\Delta = 30$ ms in FOF. The differences are probably due to different intrinsic vowel durations of open and closed vowels: since the production of open vowels involves a greater amount of jaw lowering they tend to have larger intrinsic durations than closed vowels (Lehiste 1970).

We found a systematic effect of FOCUS STRUCTURE on the durational measures for speaker DM [ $F(2, 42) = 70.215, p < 0.001$ ] and WP [ $F(2, 42) = 34.501, p < 0.001$ ]. For both speakers we found three separate subgroups (post-hoc: BG < SOF < FOF). There was no significant interaction between FOCUS STRUCTURE and VOWEL.

Figure 3 provides an example of the effect of FOCUS STRUCTURE on the durational measures. The figure shows means and standard errors for word duration, separately for each target word (B/a:/ber, left figure; B/i:/ber, right figure), for each speaker (DM, WP), and focus structure (Background, SOF, FOF). The corresponding values are shown in Table 1.

**Figure 3:** *Acoustic word durations (means and standard errors in ms)*

In the target word B/a:/ber, both speakers produce larger word durations from Background to SOF (DM:  $\Delta=59$ ms; WP:  $\Delta=19$ ms), and from SOF to FOF (DM:  $\Delta=23$ ms; WP:  $\Delta=14$ ms).

In the target word B/i:/ber, speaker DM produces larger word durations from Background to SOF ( $\Delta=41$ ms), and from SOF to FOF ( $\Delta=27$ ms). In contrast, speaker WP produces systematically larger durations only from SOF to FOF ( $\Delta=21$ ms), but not from Background to SOF.

Vowel	Speaker	BG	SOF	FOF
/a:/	DM	314 (14)	373 (13)	396 (13)
	WP	320 (10)	339 (7)	353 (8)
/i:/	DM	298 (7)	339 (21)	366 (28)
	WP	290 (13)	303 (15)	324 (9)

**Table 1:** *Mean acoustic words durations (means and standard deviations in ms)*

To sum up: for both speakers we found larger word durations from Background through SOF to FOF, which is tantamount to a gradient but systematic increase in the prominence level of the three focus structures.

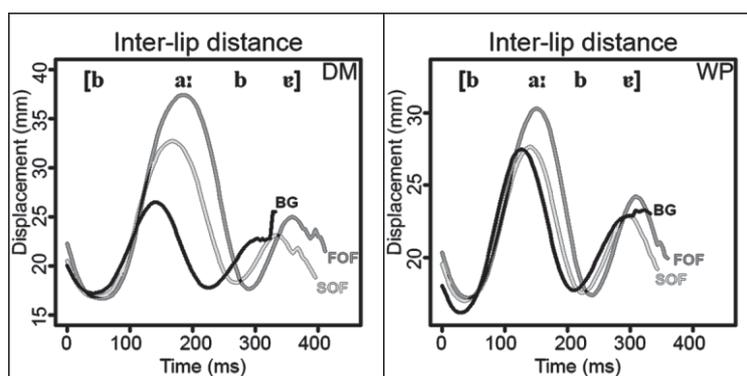

The results were very clear and consistent for target words containing an open vowel, B/a:/ber. However, for the closed vowel /i:/, the results were less clear, at least for speaker WP. We interpret this difference to be due to a different degree of coarticulatory resistance of open versus closed vowels. It has been reported for French that an open vowel (/a/) is highly affected by prosodic structure (boundary strength) showing

lower tongue and jaw positions and therefore longer durations at strong prosodic boundaries compared to weak boundaries (Tabain 2003). In contrast, a closed vowel (/i/) involves a higher degree of articulatory precision and is therefore less variable across prosodic contexts (Tabain et al. 2003). The less clear results for /i:/ in our data can thus be explained. In the following, we discuss the articulatory strategies used for target words containing open vowels.

### 3.3 Articulatory marking

All articulatory measures were analysed with one-way ANOVAs for the individual speakers and with a Tukey post-hoc test for the three-level factor FOCUS STRUCTURE (Background, SOF, FOF).

Figure 4 provides averaged trajectories for the distance between the upper and lower lip (Lip Aperture index) during the production of the target word B/a:/ber. Low displacements indicate that the lips are closed for the production of the stop consonants. Going from Background to FOF, we can see an increase in duration and displacement (corresponding to Lip Aperture, Byrd 2000) for both speakers. Furthermore, when comparing Background and SOF, we can see an increase in *durations* for both speakers. However, an increase in *displacement* from Background to SOF is only observable for speaker DM.

**Figure 4:** Averaged trajectories for lip opening and closing movements during the target word B/a:/ber for each speaker DM and WP and focus condition

Table 2 provides means and standard deviations for the separate articulatory measures in the opening and closing gesture of the lips in 'CV:C-sequences. The opening gesture is defined as the movement of the lips from the maximum closure during the initial

consonant to the maximum opening during the following vowel in the accented syllable. The closing gesture is the movement from the maximum opening during the vowel to the maximum closure during the intervocalic consonant; the intervocalic consonant is the onset of the post-accented syllable. Both gesture types (opening and closing gesture) have been proposed to be controlled differently (Gracco 1994).

In the opening and closing movements, we measured mean durations, maximum displacements, peak velocities (related to the maximum speed) and time-to-peak velocities. While the peak velocity is related to the *absolute* (maximum) speed of the movement, the time-to-peak velocity describes the *relative* speed of movement. Time-to-peak velocity is calculated as the time from the onset to the peak velocity of the opening (or closing) movement. It serves as an indicator for gestural stiffness (which is an abstract, primary control parameter within the framework of a mass-spring model; see Saltzman & Munhall 1989). A gesture with a lower stiffness (= related to an *increase* in time-to-peak velocity) reaches the target later than a gesture with a higher stiffness. We expected to find an increase in durations, displacements, peaks velocities and time-to-peak velocities from Background (unaccented) to FOF (accented) condition in the opening and closing gesture.

OPENING GEST.		BG	SOF	FOF
DM	dur (ms)	99 (6)	121 (8)	130 (7)

**Table 2:** *Articulatory measures for opening and closing gesture in the CV.:C sequence during B/a:/ber (means and standard deviations in parenthesis) for both speakers*

As can be seen from Table 2, however, the picture is not as clear when comparing Background to SOF. Nevertheless, we found systematic differences ( $p < 0.05$ ) for both speakers in these two focus structures. In the following we discuss the strategies employed by the two speakers separately.

First, we compare the articulatory measurements (opening and closing gesture, lip movement) for speaker DM. Figure 5 provides medians and quartiles for the respective measures. In the opening gesture, all values increase from Background to SOF. The analysis revealed that FOCUS STRUCTURE ( $p < 0.01$ ) induces larger durations ( $\Delta = 22\text{ms}$ ),

larger displacements ( $\Delta=6.6\text{mm}$ ), higher peak velocities ( $\Delta=84\text{mm/s}$ ), as well as higher time-to-peak-velocities ( $\Delta=5\text{ms}$ ). The adjustments in the opening gesture are comparable to the closing gesture. In the closing gesture, all values also systematically increase from Background to SOF ( $p<0.001$ ) with larger durations ( $\Delta=15\text{ms}$ ), larger displacements ( $\Delta=6\text{mm}$ ), higher peak velocities ( $\Delta=85\text{mm/s}$ ), and higher time-to-peak-velocities ( $\Delta=13\text{ms}$ ).

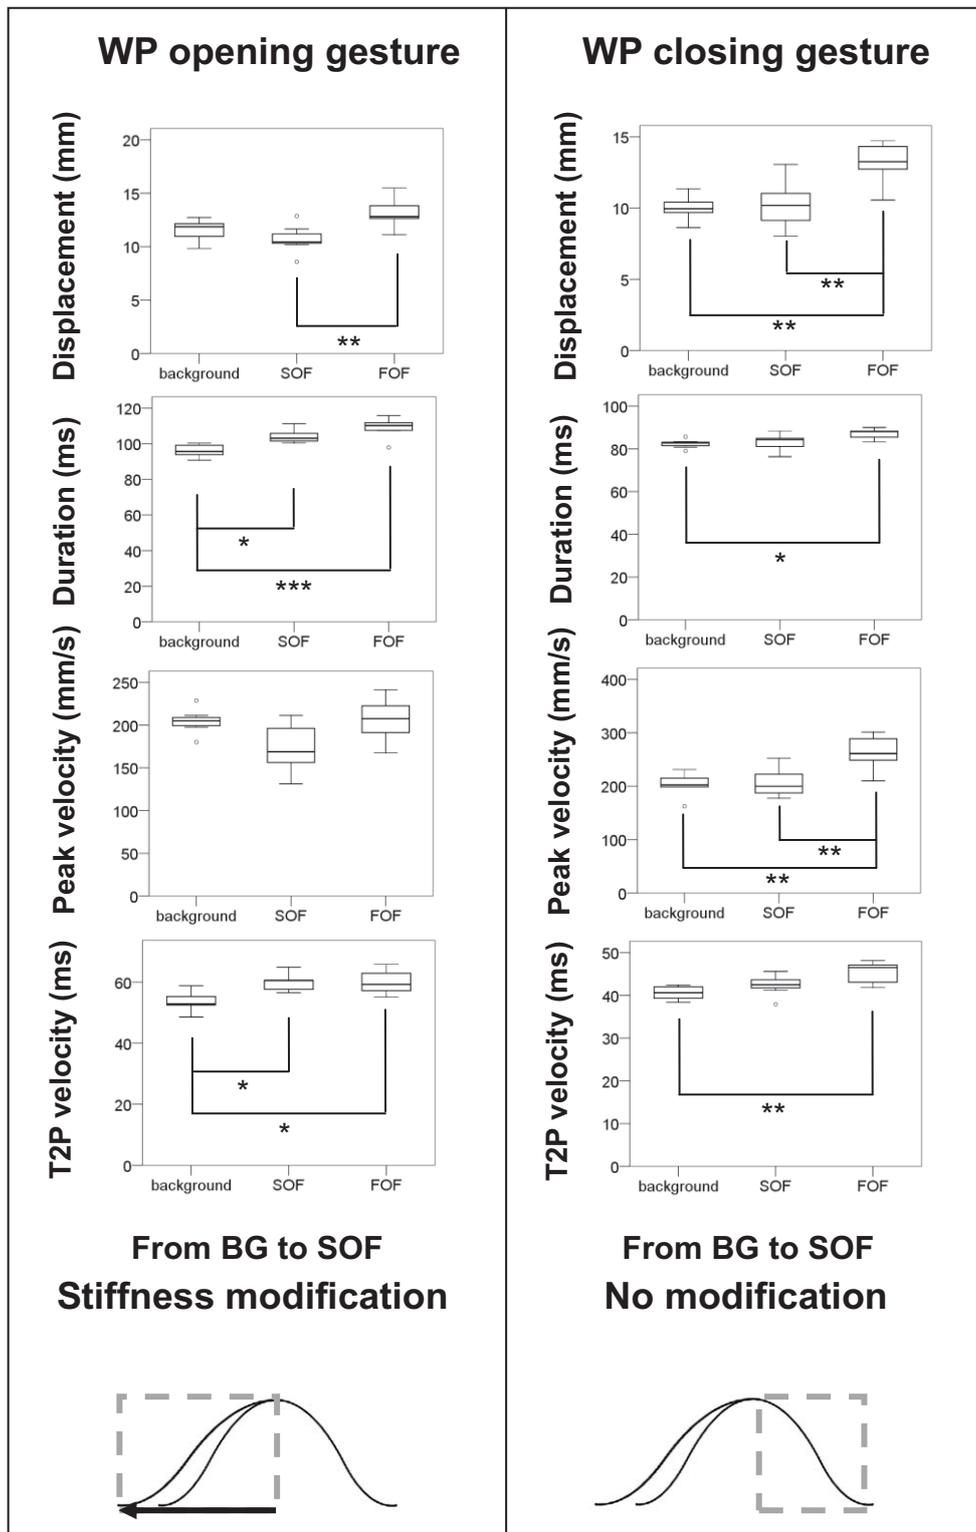

To sum up the results for speaker DM, she adjusted all parameters in the opening and closing gesture. In a mass-spring model, these adjustments can be explained by a non-proportional change of the control parameters *Target* and *Stiffness*. The size of the whole opening gesture is rescaled in a non-linear way. That type of resizing of a movement corresponds to the articulatory strategy of *non-linear rescaling* (schematised at the bottom of Figure 5).

**Figure 5:** *Articulatory measures for speaker DM (all focus conditions) and stylised strategies for distinguishing Background from SOF*

Figure 6 provides medians and quartiles for the opening and closing gesture for speaker WP. In contrast to speaker DM, WP did not adjust all parameters from Background to SOF. In the opening gesture, we found an increase of the temporal measures ( $p < 0.05$ ) with larger durations ( $\Delta = 8\text{ms}$ ) and higher time-to-peak-velocities ( $\Delta = 6\text{ms}$ ). In the closing gesture, focus structure did not reach significance for the respective measures.

Within the framework of a mass-spring model, speaker WP modified the control parameter stiffness in the opening gesture by lowering the stiffness from Background to SOF (=increase of movement duration and time-to peak velocity, see Figure 5). However, in the closing gesture no systematic modifications from Background to SOF could be found.

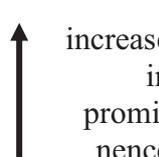

**Figure 6:** Articulatory measures for speaker WP (all focus conditions) and stylised strategies for distinguishing Background from SOF

To sum up the kinematic results for the target word B/a:/ber: both speakers distinguished between Background (unaccented) and FOF (accented) by increasing durations, displacements, peak velocities and time-to-peak velocities. Furthermore, both speakers (DM and WP) distinguished between Background and SOF.

However, when comparing Background and SOF, we found speaker-dependent strategies. Speaker DM modified the opening and closing gestures by adjusting all parameters (non-linear rescaling or resizing of the whole gestures). In contrast, speaker WP only modified the opening gesture and adjusted those parameters related to the stiffness of the movement (lower stiffness from Background to SOF by increasing duration and time-to-peak velocity).

#### 4. Conclusions

We found systematic differences in marking the three focus structures under investigation (Background, SOF, FOF) for both speakers. Table 3 provides an overview of the strategies used.

	Tonal	Durational	Articulatory		
	(nuclear) pitch accent	acoustic word duration	stiffness (related to duration of movements)	target (displacement; related to sonority expansion)	
FOF	yes	larger	lower	higher	
SOF	no				
BG	no	smaller	higher	lower	

  
 strategy speaker-dependent

**Table 3:** Summary of tonal, durational and articulatory adjustments as prominence increases in the marking of target words in three different focus conditions

In terms of *accent placement*, the results were consistent – and involved a discrete difference: Background and SOF elements were generally deaccented (speaker DM

marked a few instances of SOF by low accents, though), whereas FOF elements received pitch accents throughout.

Furthermore, the non-tonal *acoustic parameters* (word duration) considerably increased from Background through SOF to FOF. Those differences in acoustic durations correspond to *articulatory modifications*. We found larger durations of the opening and closing movements in the target 'CV:.C-sequences (stiffness modifications) and higher displacements (resizing of the whole gesture), while opening gestures were more strongly affected than closing gestures (speakers employed different strategies). Within the framework of the H & H theory (Lindblom 1990), we might say that target words are *hypoarticulated* in Background position (unaccented) and *hyperarticulated* in FOF position (accented) with the prominence level of SOF being intermediate between the two. However, since our articulatory investigations are restricted to lip movements, the higher degree of 'hyperarticulation' is related to a higher degree of *sonority expansion* from Background through SOF to FOF (Harrington et al. 2000). Acoustic and articulatory markings turned out to be gradient in nature but still displayed systematic differences. That is, there is an overlap between the phonetic realisations of Background and SOF items as well as between SOF and FOF items. Furthermore, the extent to which single speakers employ the acoustic and articulatory strategies varies.

The intermediate 'degree of prominence' which can be attributed to SOF items raises the question of its phonological status. Previous studies have tried to attribute various concepts to it, such as 'metrical accent' (Rooth 1996), 'metrical prominence/stress' (Büring 2008) or 'phrasal stress' (Beaver et al. 2004). Interestingly, the prominence on SOF constituents resembles the type of prominence Halliday (1967) claimed to be used for marking 'secondary information focus', which he defines as "information that is either new but subsidiary or given but to be noted" (1967: 209). An example is given in (5), in which *costs* is given information but made prominent by an 'extra' tonic (a 'compound tone' in Halliday's terms: a fall on *reasonable* plus a low rise on *costs*).

- (5) It seems perfectly REASONable to take the costs into account.

Prominences like these have been analysed by Grice et al. (2000) as 'phrase accents', which are defined as edge tones with a secondary association to either phrase-final or stressed syllables: "Such secondary associations give rise to tonal configurations that may resemble ordinary pitch accents, but do not signal focus or prominence in the

same way, reflecting their essentially peripheral nature” (2000:180). This ‘peripheral nature’ qualifies phrase accents as markers of ‘secondary information’, which also seems to apply to SOF elements.

However, phrase accents are defined tonally, and tonal movements on SOF items could not be found in our data. Nevertheless, the marking of SOF may have a tonal element after all: in many cases, the F0 minimum was reached on the lexically stressed syllable in an SOF word. More research is needed to explore the status of postnuclear prominences in general, and of SOF prominences in particular.

# The Effect of Lexical Tone and Focus on the Formation of F0 in Vietnamese

Stefanie Jannedy

Center for General Linguistics (ZAS)  
Schützenstraße 18 – 10117 Berlin, Germany  
jannedy@ling.ohio-state.edu

## Abstract

We investigated the effect of focus on the formation of f0 in the three modal tones in the Hà Nội dialect of Vietnamese. This dialect contrasts six lexical tones, has no tone-sandhi, the language does not have morpho-syntactic focus marking and uses prosody exclusively to express pragmatic contrasts (Jannedy, 2007) by means of intonational emphasis in ways similar to English or German. To tease out the effect of focus on the duration and f0 of the level tone *ngang*, the rising tone *sắ́c*, and the low level tone *huyề̀n*, identical short SVO-type utterances were elicited with a question-answer paradigm under four focus conditions (subject-, verb-, and object focus and in a neutral reading). Results indicate that the tone especially under subject- and verb- but also object focus show differences from the neutral reading, we find an f0-excursion for the *ngang* tone and a scoop and sharp rise for *sắ́c*. Duration of the focused syllable also increases under focus.

**Keywords:** Lexical Tone, Vietnamese, Focus, Intonation.

## 1. Introduction

### 1.1. Vietnamese

In this paper we set out to investigate the behaviour of lexical tones under focus in Vietnamese. Vietnamese is a Mon-Khmer language which are known for the complexity of their tone system: lexical contrasts are marked by tonal (pitch) as well as voice quality features (Yip, 1995). This interaction of voice quality and lexical tone also characterizes Vietnamese (Brunelle, 2003, 2006). Several more recent experimental studies have explored the perception of tone in the northern (Hanoi) and the southern (Saigon) Vietnamese dialect with six and five contrasting tones respectively, and have established that there is a higher and a lower pitch register (Brunelle, 2006; Michaud &

Vu, 2004; Michaud, 2004; Michaud et al., 2006; Nguyễn & Edmondson, 1997; Brunelle & Jannedy, 2007). The f<sub>0</sub>-contours shown in Fig.1 are representative of the standard Hà Nội dialect. The only exception is the rising tone *sắc*, which is realized relatively low, a variant found in some young female Northerners. In the Hà Nội dialect, laryngealization is tone-medial in *ngã* (steeply rising f<sub>0</sub> trajectory marked with “▲”) and tone-final in *hỏi* and *nặng* (glottalization). The three tones with a laryngealized voice quality are represented by a dotted line. The *huyền* tone is partially breathy. The rising tone *sắc* is fully modal and usually rises from the bottom of the pitch range to the top. The three tones in the lower register are *hỏi*, *huyền* and *nặng*. The neutral tone is called *ngang* and remains fairly stable in pitch throughout.

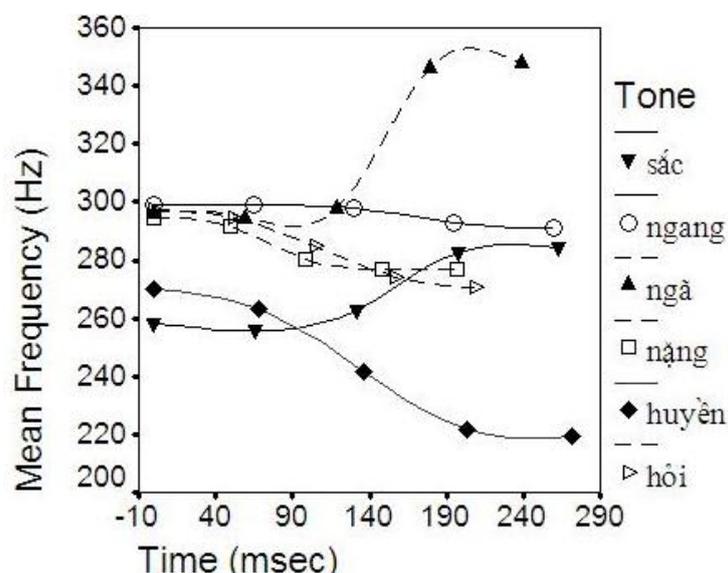

Figure 1: Mean f<sub>0</sub>-contours (over five repetitions) for the six lexical tones of the Hà Nội dialect of Vietnamese as produced by a female speaker (used as stimuli in the experiment described in Brunelle & Jannedy, 2007).

Vietnamese is an isolating language, most words consist of mono-syllables. It is unclear though if syllables are the tone bearing units in Vietnamese (as is the case in Ewe, Hausa, Chicheŵa or Mandarin Chinese) or if moras are (as in Japanese or Thai, see Morén, 2003). Furthermore, it is remarkable that while Vietnamese has strong tonal coarticulation (Han & Kim, 1974; Brunelle, under review), the language does not have tone-sandhi rules as we know them for languages such as Mandarin Chinese, Cantonese or Taiwanese. Tone-Sandhi refers to the changes in the values of lexical tones in the context of other tones. A well-known example from Mandarin Chinese is the change of

a low-tone to a rising tone when it is followed by another low tone. No such consistent rules are known for Vietnamese and none of the standard grammar books on the language (Thompson, 1965; Nguyễn, 1997) make reference to it. There is also no phonological downstep: the successive lowering of high tones often observed in register tone languages. There may be other non-systematic intonational downtrends such as final lowering (the lowering of the pitch towards the end of an utterance or phrase) or declination (a decline of the  $f_0$  over the course of the utterance); however, with the exception of Dung et al. (1998), none of the grammars, offer somewhat systematic descriptions of intonational variation.

Given the tonal complexity of the language and what has been stated in the sporadic reports published on tones, tone implementation and intonational emphasis, the question arises whether or not the language makes use of prosodic cues to signal information structural content or whether it needs to revert to other means such as the usage of particles or specialized syntactic positions to signal focus or topic. Occasional references to the use of prosodic means for emphasis and for phrasing can be found on some of the older, somewhat sparse, literature (Thompson, 1965; 1981; Nguyễn, 1990; Dung et. al. 1998).

Heavy stress singles out the syllable or syllables of each pause group which carry the heaviest burden of conveying information. Weak stress accompanies syllables, which bear the lowest information-conveying load in the pause group. They often refer to things which have been brought up earlier or which are expectable in the general context. Other syllables are accompanied by medium stress.

Thompson (1965:106)

Mai (1967:24) also describes intensity as one of the integral aspects of intonation in Vietnamese. Intonation contours are "superimposed on the basic tone system; they modify the pitch characteristics of the tones, but do not affect the tonemic contrast between them [...] the basic intonation contours are intrinsically linked with the overall intensity patterns." Similarly, Michaud & Vu (2004) state: "Vietnamese also possesses intonational emphasis: as in many languages, the great variability observed in the realization of the lexical tones largely reflects the informational prominence of various syllables in the utterance..." and they conclude "[...] a stable correlate of emphasis is curve amplification, manifested [...] as an increased slope of  $F_0$  curve [...] or as  $F_0$  register raising."

The lack of detailed descriptions of phonetic or phonological properties of structuring or emphasizing information in Vietnamese is apparent. Evidence reported in the literature and our first pilot studies strongly suggest that Vietnamese shows properties that are often associated with intonational phrasing and prosodic prominence in intonation languages: it has pitch range effects of the same sort seen in the intonational marking of emphasis and it also has pausing and other rhythmic effects of the sort associated with intonational phrasing observed in English and German.

In studying prosodic prominences and the resulting pragmatic interpretation of *prosodic focus*, there are two over-arching questions that are more effectively responded to if they are addressed together. One question pertains to the mechanics of how the speaker imparts prominences to some parts of an utterance but not to others, while the other question addresses the listener's interpretation of such prominences - i.e., the function of prosodic focus from the listener's point of view. A fundamental assumption in posing the first question is that the speaker has various methods at his/her disposal to make some part of an utterance prosodically more prominent than other parts. In English and languages like English, for example, one important means of making a particular word more prominent than surrounding words is to align a pitch accent — a prominence lending tonal morpheme — with the syllable in a word that bears primary stress. Most current accounts of prosodic focus in English recognize this mechanism of putting a constituent in prosodic focus, and in one particularly influential account, due to Selkirk (1984, 1995), this is the only mechanism recognized. Other accounts, however, suggest that other aspects of the tune also may play a role in imparting prominence. For example, the accented word that is the last accented material in its phrase is also aligned to another tonal morpheme, the phrase accent, which is simultaneously aligned to the end of the phrase as well. When it is followed immediately by the phrase accent, a pitch accent becomes the 'nuclear accent' in its phrase. In the account of Pierrehumbert (1980) and her colleagues (e.g., Beckman & Pierrehumbert, 1986; Beckman & Edwards, 1994), any nuclear accent is more prominent than all earlier, non-nuclear accents. (This is related to Ladd's (1980, 1996) notion of 'deaccenting', which says that an accented word can be made prominent if all following material is left unaccented, effectively positioning the nuclear accented word early in its phrase). The important point is that if word order remains constant and it can be observed that prosodic emphasis is being shifted from one constituent to another, a structure with an early prosodic prominence is cognitively more salient (due to the unaccented post nuclear tail) than a structure with a prosodic prominence late in the utterance (Beckman, 1996). This is probably due to the probability of distributions of

early prominences versus late prominences in running discourse and the expectations that hearers have.

An equally fundamental assumption underlying the second question is that speakers use prosody and prosodic focus to facilitate and guide the hearer's understanding and comprehension of the message being conveyed at any particular time in a discourse. Thus, one of the uses of intonation is to guide the listener's interpretation of the utterance in relationship to the larger discourse context. Different intonational structures, then, are used to distinguish one discourse purpose, one extension of the current discourse state, from other possible moves in the mutual building of the discourse structure by the speaker and hearer, they are used to manage discourse content (Krifka, 2006). This function of intonation makes it difficult to test claims that two or more intonation patterns differ categorically.

This differs markedly from claims about the number of tones in contrast in languages such as Mandarin Chinese, Cantonese or Vietnamese, which can be tested by seeing whether the tune distinguishes one word from any other word that could have occurred in the same place. Listeners are generally very good at identifying which of two minimally contrasting words they heard. They are generally much less facile at identifying different discourse intentions, unless the differences also trigger a difference in truth conditions. One of the challenges for psycholinguistics, therefore, is to devise tasks that tap the listener's competence in interpreting the intended discourse purpose rather than training listeners to attend to specific aspects of the signal. In studying the functions of prosodic focus, for example, the psycholinguist must find an experimental design that can be used to determine how exactly different prosodic manipulations contribute to the introduction of new entities or highlighting of old entities in the interpretation of the discourse purpose of an utterance.

### *1.2. Focus and Focus in Tone Languages*

Focus is one of the most important information structural categories as it serves the purpose to make some part of an utterance more salient over other parts. Krifka (2006) defines focus to serve the purpose of indicating the presence of alternatives. While in intonation languages such as English and German, modulation in F0 strongly marks the part of the message that is to be most salient, tone languages are characterized by using a modulation in F0 (*tone*) to mark lexical and/or grammatical contrasts. This was taken as an argument as to why one should not (or to a much lesser extent) find variation in F0 to mark information structural content such as focus or utterance finality

(Cruttenden 1997:73). However, by now there is ample evidence from Asian (Xu, 1999: Mandarin Chinese) and African tone languages (Kanerva, 1990; Downing, 2006: Bantu; Fiedler & Jannedy: Ewe) that these also, exclusively or in addition to morpho-syntactic markings, use prosody to indicate information structural content. None of the languages investigated so far though, had six lexically contrasting tone, differing in F0 and voice quality features. While tones with non-modal or breathy components are difficult to investigate with the current phonetic tools available, we only investigated the three modal tones of this system. Vietnamese however provides the perfect testing ground for the interaction of tone and intonation as no grammatical description of this language has indicated morpho-syntactic devices such as particles, morphemes or fronting as possible means for the expression of information structural content.

### *1.3. Perception & Recoverability*

In a previous experiment, we have tested whether simple SVO sentences in Vietnamese that were elicited with a *wh*-question, could be linked back up with the question underlying the statement: the test material was recorded in a *wh*-question-answer paradigm from a male and a female native speaker of the northern dialect of Vietnamese. While the questions and replies were presented in writing, both speakers were present for the recordings and prompted each other with the questions, they were rendered as quasi-spontaneous rather than read. For each focus condition and sentence type, we elicited one through three tokens of which both speakers selected their “best” renditions.

To understand and evaluate the listener's competence in interpreting the intended discourse purpose of an utterance, we wanted to test whether the *wh*-focus alternative question was recoverable from the reply utterance presented out of context. Six native listeners of Vietnamese, naïve as to the purpose of the experiment, aged between 21 and 26, participated in a short forced-choice identification perception task. The test data consisted of three sentence types that were each elicited in five focus conditions and spoken by our two native speakers ( $3 \times 5 \times 2 = 30$  test sentences).

These 30 test sentences were played five times each (in randomized order) to each of the six listeners that participated. The sounds were presented over *Sennheiser* headphones and were called up by a script in Praat. The listeners were asked to match each heard utterance back to one of the five questions that were visually displayed to them on a computer screen.

Thus, we elicited 900 responses in total (30 sentences x 5 repetitions x 6

listeners = 900). That is, a total of 180 responses were collected for each of the five focus conditions tested (900 items in perception test / 5 focus conditions = 180 items per focus condition). A summary of the data and responses is provided in Table 1.

<i>response</i>	<i>Stimulus -Type</i>				
	Sub-Foc	V-Foc	O-Foc	VP-Foc	S-Foc
Subject	142 (78.89)	4 (02.22)	3 (01.67)	7 (03.89)	14 (07.78)
Verb	5 (02.78)	135 (75.00)	10 (05.56)	34 (18.89)	7 (03.89)
Object	11 (06.11)	15 (08.33)	94 (52.22)	34 (18.89)	33 (18.33)
VP Phrase	9 (05.00)	21 (11.67)	33 (18.33)	46 (25.56)	56 (31.11)
Sentence	13 (07.22)	5 (02.78)	40 (22.22)	59 (32.78)	70 (38.89)
Total	180 (100%)	180 (100%)	180 (100%)	180 (100%)	180 (100%)

Table 1: Number of responses in five categories per stimulus type (raw numbers and percentages).

A chi-square test on the raw counts of the observed data was significant ( $\chi^2=998.47$ ,  $df = 16$ ,  $p<.001$ ), indicating that the listeners did not match answer utterances randomly to questions. That is – despite the word order remaining constant in all five focus conditions – the prosody helps to disambiguate and lets listeners correctly match answers to questions. In fact, as Figure 1 shows, listeners identified the subject-focus, verb-focus and object-focus questions that matched the utterances they heard, quite well. There are less reliable patterns in the VP and sentential focus condition. However, results indicate that even in these conditions, listeners responded above chance level (20%).

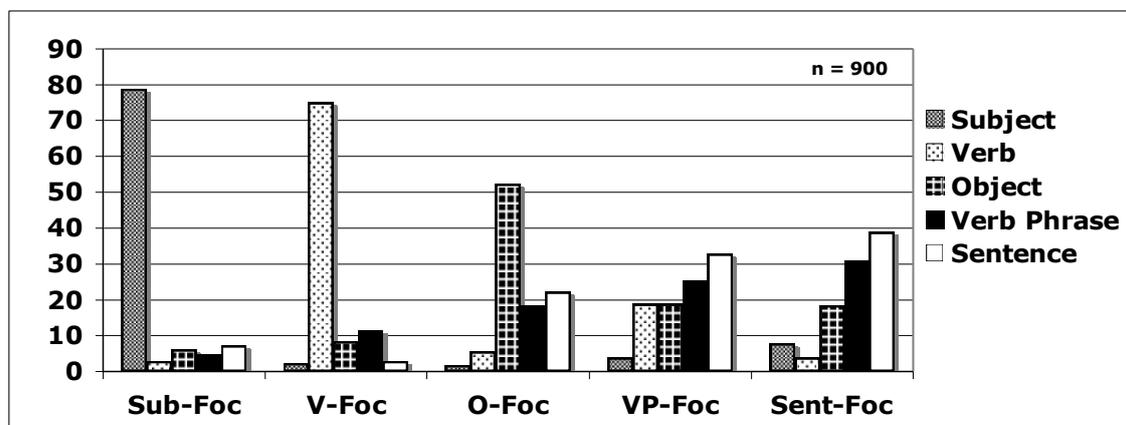

Figure 2: Visualization of the data (in %) presented in Table 1.

Since word order has remained constant, the difference between the focus conditions has to be marked prosodically. However, precisely what parameters (duration, f0, intensity, vocal effort) or what combination thereof are modified is less clear at this point. Considering the VP-Focus and Sentential-Focus conditions, it appears that listeners have a general preference for less marked questions such as those asking for a broader focus constituent such as Sentence focus. Since this study is based on only a relatively small amount of exploratory data, we cannot make further claims about this observation at this stage.

## 2. Experiment

### 2.1. Corpus

We constructed a corpus consisting of 21 simple SVO-sentences, all differing with regard to the lexical tones on the subject, verb and object.

- |     |        |        |          |                   |
|-----|--------|--------|----------|-------------------|
| (1) | S      | V      | O        |                   |
| a.  | Lê     | mua    | nho.     | ngang ngang ngang |
|     | Lê     | buys   | grapes.  |                   |
| b.  | Ngà    | làm    | nhà.     | huyền huyền huyền |
|     | Ngà    | builds | a house. |                   |
| c.  | Má     | lấy    | muối.    | sắc sắc sắc       |
|     | Mother | takes  | salt.    |                   |

Each target sentence was elicited in a question-answer context under laboratory conditions. For an example, see below:

Question	Translation	Answer	Focus
Chuyện gì thế?	What is happening?	[Má lấy muối] <sub>F</sub>	Sentential
Ai lấy muối đây?	Who takes salt?	[Má] <sub>F</sub> lấy muối	Subject
Má lấy gì đây?	What is Ngà taking?	Má lấy [muối] <sub>F</sub>	Object
Má làm gì với muối đây?	What is Mother doing with the salt?	Má [lấy] <sub>F</sub> muối	Verb
Má làm gì đây?	What is Mother doing?	Má [lấy muối] <sub>F</sub>	VP

Table 2: Example of the Question-Answer Paradigm exemplified on sentence (1c).

Only three of these tonal configurations are described in more detail in this paper.

Four native Hà Nội Vietnamese speakers (3 females, 1 male) read the sentences 5 times as a reply to questions although we will only show details for the female speakers.

## 2.2. Subjects

So far, we have analyzed the data for three female speakers and one male speaker. Here, we only report the pooled data for the females. All study participants were native speakers of the northern dialect of Vietnamese and ranged in age between 20 and 22. They were recorded in Berlin (Germany) as all of them lived here. Two of the speakers were students at the university while one speaker was a professional.

## 2.3. Methods

All elicited utterances were constructed to contain three monosyllabic words with either the level tone *ngang* or the rising tone *sắc* and the low level tone *huyền* on each word. The data was phonemically annotated in Praat (Boersma & Weenink, 2007) and the duration and F0-maximum was extracted for each phoneme. Time-normalized F0 contours were created via a script (Xu, 2007) and overlaid for easier visual comparison. We calculated the F0 at five different time points (beginning, 25%, 50%, and 75% into the vowel and at the end) within the tone bearing vowel in the word under focus. For the statistical analysis of the F0, we fitted an *ordinary least squares linear regression* (ols) model to our data as simply extracting the F0-maximum or -minimum value did not capture the dynamic movement of the fundamental frequency. We fitted a *local weighted polynomial regression* (lowess) to the five extracted point in each tbu as the lowess regression is a reliable statistical technique to smooth curves without previous assumptions about their shape (Petroni & D'Imperio, 2008). For the analysis of the duration data, we conducted *wilcoxon rank sum tests* (binary comparisons) that make different assumptions about the distribution of the data than a normal t-test.

## 2.4. Results

For an easier conceptualization, we have color coded the data represented in the graphs for the easier visualization of the duration and F0 (fundamental frequency) measurements. We have selected the colors orange to represent sentence focus, red to represent subject focus, green for verb focus and blue for object focus. (We also collected VP-focus utterances but will not represent them here.) Further, where

applicable we have transcribed the orthography in the corresponding colors within the graphs. As can be seen in the graphs representing the duration data, the vowel of the subject is represented by the red color, verb is represented by green and the object in each sentence is represented by blue. In these cases, we have extracted the duration of the tone bearing unit (the vowel) for each utterance. All F0 graphs and all duration graphs have been plotted on the same scale for easier comparison. Note though that the *huyền*-tone appears to be realized in a rather compressed pitch range so that F0 variation is hardly visible on this scale.

#### 2.4.1. Level Tone (*ngang*)

Time normalized F0 contours for the subject-, verb, object- and sentence focus conditions for an utterance specified with the *ngang* tone throughout are shown in Figure 3. Note that the four different coloured lines represent different focus conditions and that we compared all focus conditions to the sentence focus condition as we assume that this should be the prosodically and informationally least marked structure of all focus conditions. In the following, we are only considering the F0-data within the tone bearing units, that is, the three vowels in the utterances.

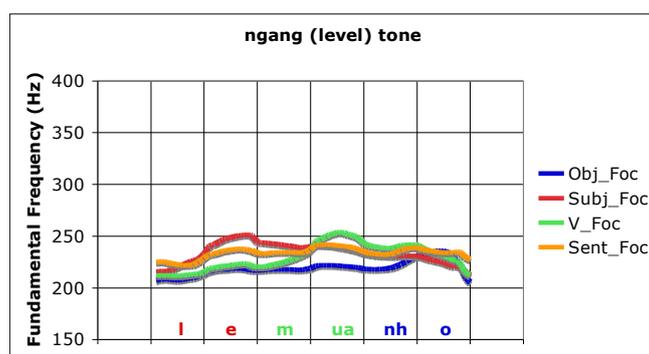

Figure 3: Time-normalized F0-trajectories for four focus conditions, all words are specified with the level tone *ngang*.

The graph in Figure 4 represents the 5 equi-distant measurement points within each tone bearing unit. Here, we show a binary categorization of the data into focused (F) and non-focused (n) points at each of the five time points. The solid line represents the regression line (*lowess*) for the focused and the dashed line for the non-focused cases.

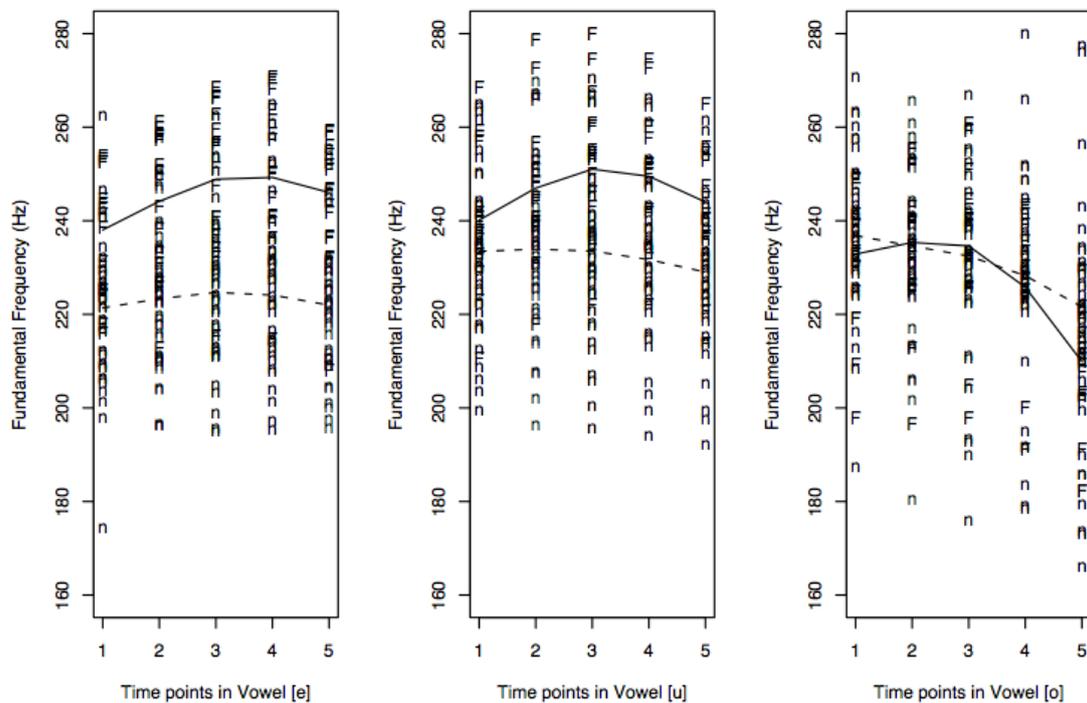

Figure 4: F0-values at five measurement points for the focused vowel (F) in comparison to the unfocused vowels (n) specified with the rising tone *ngang*.

This type of representation makes it possible to explore data visually and compare the tendencies in the data for the *ngang* toned words under focus versus no-focus. While it seems apparent, that focus causes a rise of the level tone for the subject (left panel) and verb (middle panel) focus cases, there appears to be a steeper fall in the f0 in the object focus case. A more detailed statistical exploration of the data is on the way. The ordinary least squares linear regression analysis shows a significant effect for focus ( $df = 5$  [as the analysis also includes VP focus],  $F = 27.78$ ,  $p < .0001$ ) but not for the individual time point at which the F0 was logged ( $df = 8$ ,  $F = 1.83$ ,  $p = .07$ ), showing that throughout the vowel, the F0 of the subject in the subject focus case is increased compared to when the vowel is not focused.

For the second vowel [u] in Figure 4, there is also no effect of the time point at which the F0 was taken. We do however see, that the F0 is increased on the focused verb in comparison to the non-focused conditions which is confirmed by the statistics ( $df = 5$ ,  $F = 11.69$ ,  $p < .0001$ ). For the final vowel [o] in the object, there is an overall effect of the time point at which the F0 was taken, indicating that the F0 changes more dramatically in some points compared to other points ( $df = 8$ ,  $F = 7.45$ ,  $p < .0001$ ). Focus however, does not significantly contribute to the outcome of the model ( $df = 5$ ,  $F$

= 1.46,  $p = .20$ ), suggesting that this factor is not responsible for the differences that we find in the individual time points. At this point, we are left to speculate that a final edge effect may be contributing strongly to the finding of differences in time points. This idea could be supported by the analysis of the duration for each individual vowel in the subject- verb-, object- and sentence focus conditions.

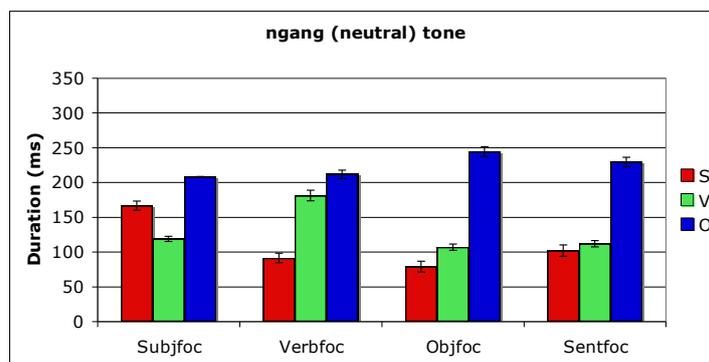

Figure 5: Time-normalized F0-trajectories for four focus conditions, all words are specified with the level tone *ngang*.

The duration of each tone bearing unit (vowel) is plotted for each sentence for each focus condition. We conducted wilcoxon rank sum tests, comparing specifically the duration of the focused vowel with the duration of the corresponding vowel in the sentence focus condition as we used this focus condition as a point of reference. For the first comparison, we find that vowel in the subject in the subject focus conditions (left most red bar), that is, under focus, is significantly elongated compared to the same vowel in the same sentence when not under focus in the sentence focus condition ( $p < .0001$ ). Comparing the duration of the vowel in the verb (second green bar in Fig. 5) in the verb focus condition with the duration of the vowel in the verb in the sentence focus condition (rightmost green bar), we also find a significant difference ( $p < .0001$ ), strongly suggesting, that focus goes hand in hand with elongation of the focused element. This effect however, seems to be obscured for the object focus condition whereby the focused tone bearing unit occurs in utterance final position. Here, a statistical comparison with the vowel of the object in the sentence focus condition is not significant ( $p > .05$ ). We speculate that an overall final lengthening effect is interacting with the elongation of the focused vowel.

#### 2.4.2. Rising Tone (*săc*)

Time normalized F0 contours for the subject-, verb, object- and sentence focus conditions for an utterance specified with the *săc* (rising) tone on subject, verb and

object are shown in Figure 6.

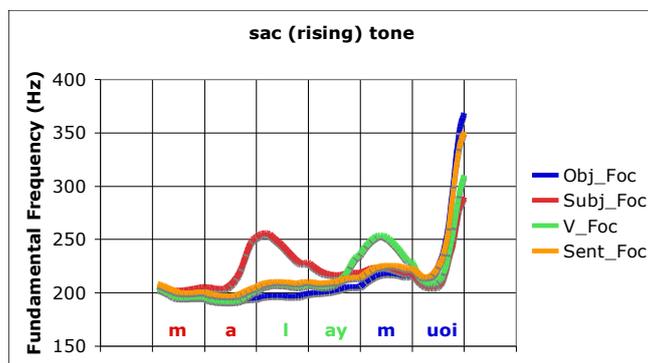

Figure 6: Time-normalized F0-trajectories for four focus conditions, all words are specified with the rising tone *sác*.

From this graph, it is quite apparent why a static measure of the F0-maximum within the tone bearing unit does not adequately capture the observed pattern: the F0 on the vowel of the verb [ay] is just about as high in the subject focus case (red line) as it is for the verb focus case (green line). However, the differences in dynamics are not captured to reflect that in the subject focus case, the F0 is falling while it is rising in the verb focus case. In both the vowels [a] in the subject (left most panel in Figure 7) and the [ay] in the verb (middle panel in Figure 5), we find highly significant effects of the pitch time ( $df = 8, F=8.1, p<.0001$  and  $df = 8, F = 8.05, p<.0001$ ), showing that for the rising tone, the F0 changes more dramatically in some points compared to other points. For the final tone bearing unit (third panel), we also have an effect of time point. Even though it is somewhat weaker ( $df = 8, F = 2.15, p<.05$ ) in comparison to the vowels in the subject and verb, we can reliably conclude that F0 changes more in some points than in others. While we do not find an effect of focus (trajectory of the solid line) on the object vowel in the object focus case ( $df = 5, F = 1, p > .05$ ), we do find strong effects of focus for the vowels in the subject ( $df = 5, F = 26.84, p<.0001$ ) and for the verb ( $df = 5, F = 9.45, p<.0001$ ).

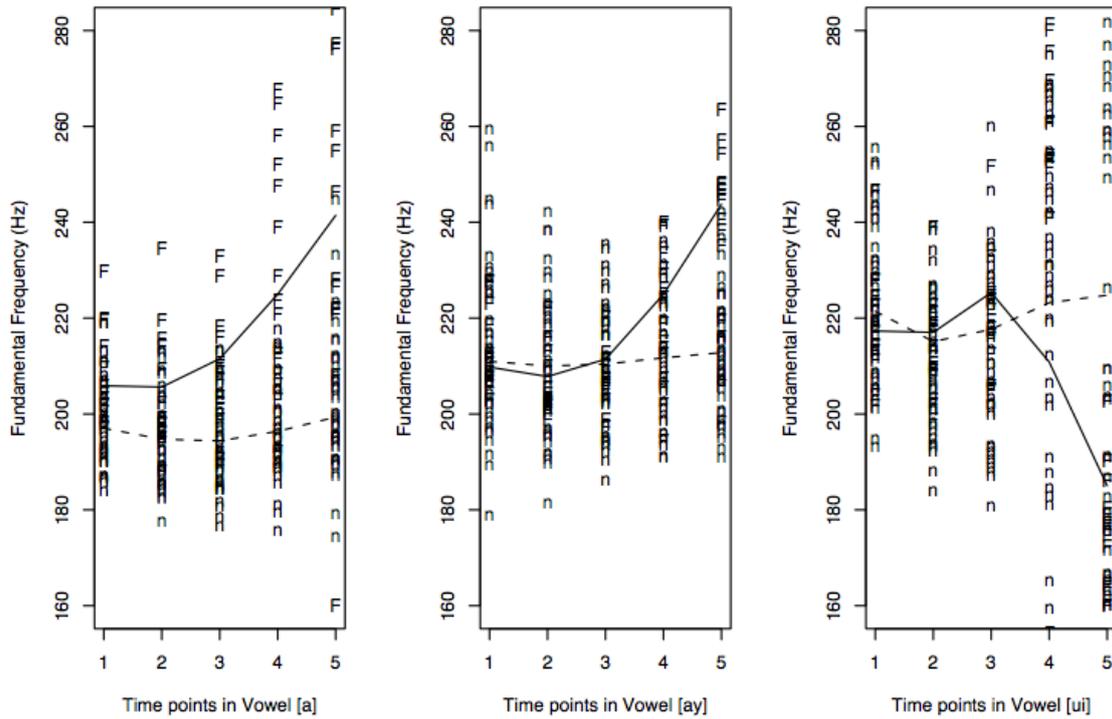

Figure 7: F0-values at five measurement points for the focused vowel (F) in comparison to the unfocused vowels (n) specified with the rising tone *sác*.

These results indicate that focus contributes significantly to the shape of and trajectory of the F0 over time, especially for the subject- and verb focus cases. For the object focus case, this effect may again be obscured by tonal effects happening at the right edge of a major phrase such as an utterance.

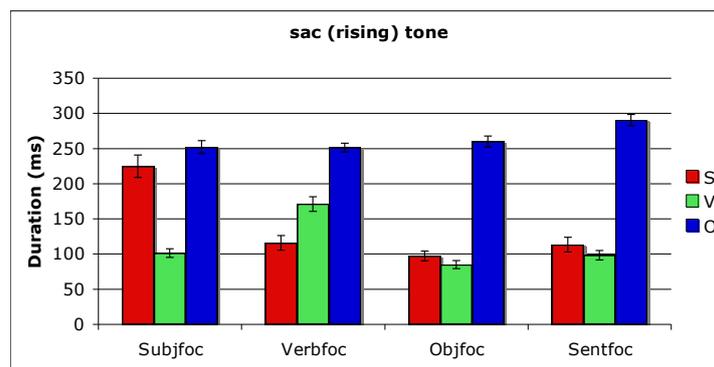

Figure 8: Time-normalized F0-trajectories for four focus conditions, all words are specified with the level tone. *sác*.

Figure 8 shows the data of the duration measurements. A comparison of the vowel

in the subject in the subject focus condition (first red bar) with the vowel of the subject in the sentence focus condition (rightmost red bar) shows a significant difference with the vowel under focus being longer ( $p < .0001$ ). The vowel of the verb in the verb focus condition (second green bar in the graph) is also significantly longer than the vowel of the verb in the sentence focus condition ( $p < .0001$ ). The final object vowel in the object focus condition (third blue bar in the graph) however is shorter than the final vowel of the object in the sentence focus condition. The difference is significant ( $p < .02$ ). This result is somewhat surprising given that we would have expected a compounding effect of focus and finality.

### 2.4.3. Low Level (*huyền*)

The third tone we are investigating is the *huyền*-tone. Time normalized F0 contours for the subject-, verb, object- and sentence focus conditions for an utterance specified throughout with the *huyền* tone are shown in Figure 9 below. While the graph in Figure 8 is intended to ease visual inspection over the overall pattern in the data, note that the *huyền*-tone appears to be realized in a rather compressed pitch range so that F0 variation is hardly visible on this scale. We have however kept the scale constant to allow for visual cross tone comparisons.

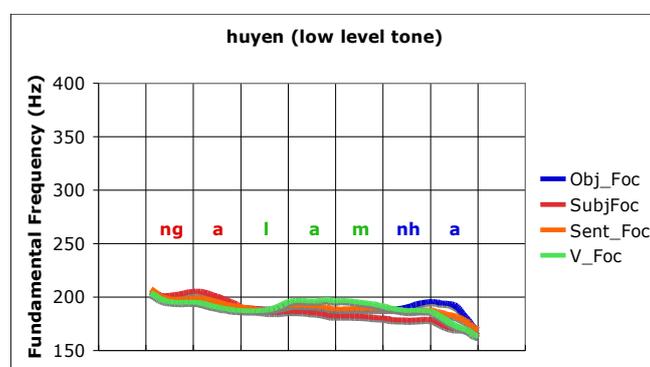

Figure 9: Time-normalized F0-trajectories for four focus conditions, all words are specified with the level tone *huyền*.

All three vowels in the sentence specified with the *huyền* are [a]. We do find significant effects of the measurement time point for the first and last vowel of the utterance (left panel (subject):  $df = 8$ ,  $F = 6.53$ ,  $p < .0001$  and right panel (object):  $df = 8$ ,  $F = 18.41$ ,  $p < .0001$ ), showing again that F0 changes more in some points than in others.

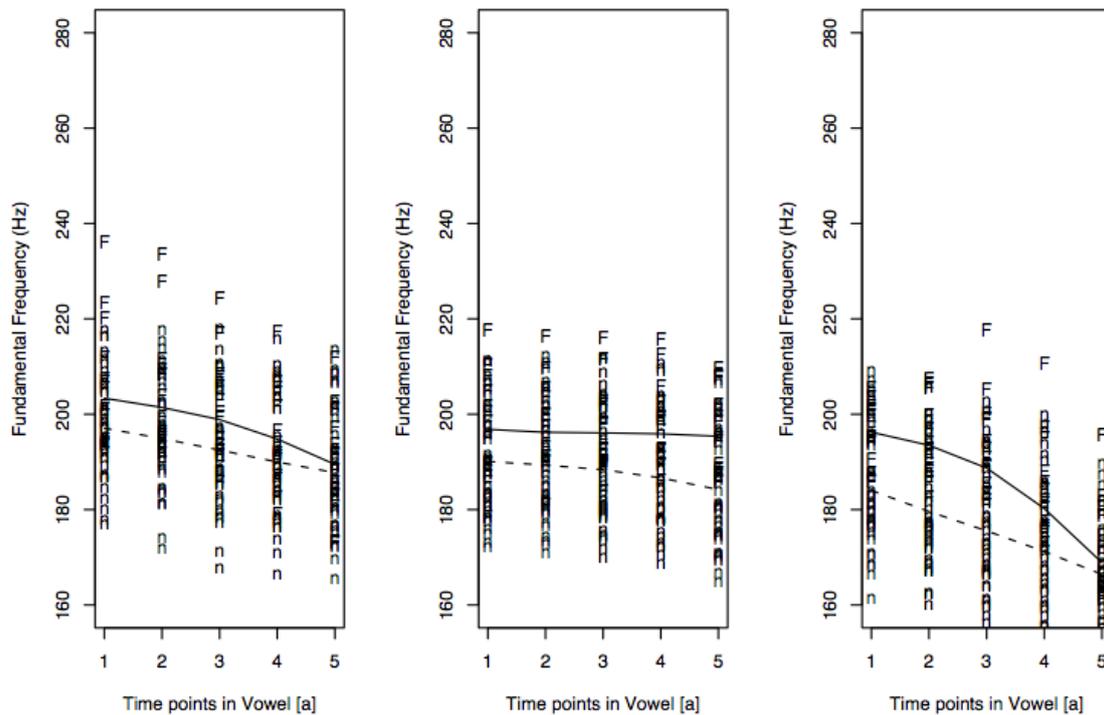

Figure 10: F0-values at five measurement points for the focused vowel (F) in comparison to the unfocused vowels (n) specified with the low level tone *huyền*.

For the medial vowel on the verb, there is no such effect ( $df = 8, F = 1.33, p >.05$ ), meaning that the F0 remains more or less constant over time. The ordinary least squares linear regression analysis shows a significant effect for focus (solid line versus dashed line) for the subject ( $df=5, F=5.92, p<.0001$ ), verb ( $df=5, F=8.05, p<.0001$ ), and object focus ( $df=5, F= 15.38, p<.0001$ ) conditions, showing that the identical tone behaves differently under focus compared to when not under focus.

There appear to be strong reflexes of focus in the duration, too. The vowel in the subject in the subject focus condition (leftmost red bar) is significantly longer ( $p<.001$ ) than the vowel in the subject of the sentence focus condition (rightmost red bar).

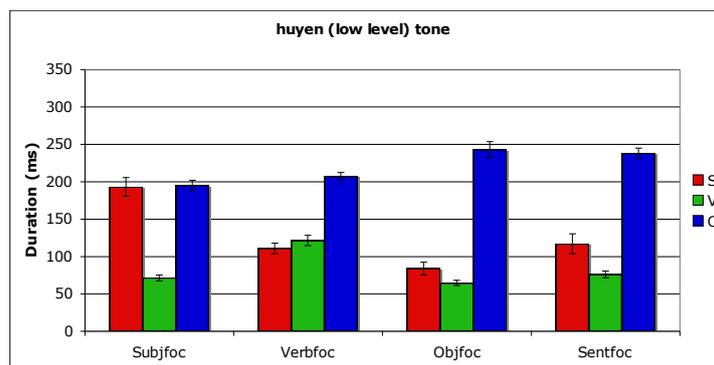

Figure 11: Time-normalized F0-trajectories for four focus conditions, all words are specified with the level tone *huyền*.

The vowel in the verb in the second focus condition also is significantly longer than the medial vowel in the sentence focus case ( $p < .0001$ ). The vowel in the object of the object focus condition (third blue bar from the left) however, is not longer than the utterance final vowel of the object in the sentence focus case ( $< .05$ ). Here, again it seems that utterance finality masks the effect of focus on the sentence final constituent.

## 2.5. Summary & Conclusion

In summary, we have shown in this paper that Vietnamese uses prosody to mark focus and also utterance finality despite the fact that it is a rather densely specified tone language. Focus is expressed tonally but also via an effect of lengthening. While there is no exact predictable shape the F0 takes to mark focus, it appears that under focus, lexical tones are more realized in accordance with their lexical shape compared to when tones are not under focus. For example, we have seen that the F0 in the rising tone *sắc* has remained flat in the subject and verb in the sentence focus cases. To mark finality however, we observed a steep rise on the object. This same final rise which we observed in all focus conditions, we also observed for the object in the object focus case. Thus, focus and the marking of utterance finality not only seem to have in common that lexical tones are more realized in accordance with their lexical shape, but also that focus is obscured more in utterance final position. The marking of utterance finality is the marking of the right edge of a prosodic domain. At this point however, we cannot make predictions as to what phrasal levels of the prosodic hierarchy to assume for Vietnamese as we have (for now) only tested simple SVO sentences to understand the general principles underlying the marking of focus in this densely specified tone language.

## Abstract

This paper explores one longitudinal case of the use of Mandarin pre-nominal DE phrases by a mother-child dyad in their natural conversation. The study focused on how the conversationalists make decisions on marking headed/ headless DE forms in the discourse context. On the basis of a qualitative/quantitative analysis in line with information flow patterns, we show that the choice of headed/headless DE is not an arbitrary one, nor is determined by structural complexity. Instead, the referential forms are regulated by the interactive and cognitive status assumed by the interlocutors. When encountering a newly introduced referent, headed DE must be used. When referring to a given referent, the choice between headed given and headless given observes the information status and the discourse requirements at the point in the conversation.

**Key words:** Reference; Referential choice; Mandarin DE; Mandarin Pre-nominal DE; Information flow

## 1. INTRODUCTION

Languages provide two devices of differentiating ‘given’ and ‘new’ entities in discourse (e.g. Chafe, 1976; Halliday & Hasan, 1976). Local markings on the noun phrase (NP), e.g. the indefinite article, in English, introduce a new referent, and global markings on the entire clause, e.g. word order, can also mark the newness of entities (Hickmann, Hendriks, Roland, & Liang, 1996). For language learners, the acquisition of linguistic competence requires that they acquire the regulation of information flow in well-formed discourse regarding the devices for marking the status of new and given information. However, previous studies primarily focused on how children refer to and/or maintain the referent in its simple form in discourse, and emphasized how

children differentiate new and given referents regarding these simple nominals in local and global devices (e.g. Hickmann *et al.* 1996). These “simple” forms include noun phrases which are either composed of determiners and nouns (e.g. *a dog*) or blanched into pronominal (*she*).

This study intends to extend the aspect of entity reference to a “complex” noun phrase: Mandarin pre-nominal DE phrases, which are rarely considered from the perspective of information status. By exploring the complex pre-nominal DE, children’s use of grammatical morpheme DE and its relation with discourse function can be established. Particularly, the perspective that the discourse function of pre-nominal DE constructions and interlocutors’ cognitive information status may affect the choice of linguistic DE forms will be our major concern.

## 2. BACKGROUND

### 2. 1. Information status in Mandarin discourse

In all languages referring expressions, NPs, can be ordered along a continuum representing the degree to which they presuppose the existence and identity of the referents (e.g. Chafe, 1976; Clark & Haviland, 1977; Halliday & Hasan 1976; Lambrecht, 1994; Givón 1976, 1983; Silverstein 1976, 1987). Along this continuum, the more explicit forms (e.g. nominals) often denote referents not presupposed in mutual knowledge (newness) between the interlocutors, while implicit forms (e.g. pronominals) denote mutually known entities (givenness). In terms of local markings of information status in Mandarin discourse, a gradient of NP types exists in Mandarin Chinese, as illustrated in (1) (Hickmann 2003:60).

NOMINALS			PRONOMIALS	
(NUM) + CL + NOM	BARE	DEM	EXPLICIT	NULL
NEW	NEW/GIVEN	GIVEN	GIVEN	GIVEN

As can be seen, nominal determiners are optional in Mandarin NP. Bare nouns (without determiner or classifier/CL) potentially denote given or new information. Researchers observed that Mandarin, being typologically different from English, varies in the particular optional and obligatory markings regarding information status. Mandarin local markings are optional to mark newness, but global ones obligatory,

whereas the reverse is true in English (Hickmann *et al.*, 1996). Therefore, Mandarin was mostly believed to provide a fruitful area for discourse-functional approach to investigate how noun phrase forms mark newness/givenness. As noted, among these different referential forms, much research focuses on simple nominals including full nouns, pronouns, zero anaphora (simple omission) and demonstratives.

With respect to global marking, Mandarin relies more on structure variations for discourse organization due to the absence of a complex morphology. Thus, NP position serves as the main feature to mark role relations in sentences, and word order (global marking) acts as a central marking in Mandarin discourse and sentence. In general, it has been proposed that Mandarin follows a universal pragmatic principle, according to which speakers prefer to place new information towards the end of the utterance and old one at the sentence-initial position. For example, subject-verb inversions such as (2) demonstrate that new information must be postverbal (Li & Thompson, 1981). Canonical subject-verb sequence such as (3) shows that the topic that is being talked about in the context (e.g. given information) must be sentence-initial (Chu, 1998). Existentials such as (4) provide another example which follows the same principle as the subject-verb inversion in (2) but uses an existential verb *you3* ('have') to present a newly introduced entity in discourse (Hickmann *et al.*, 1996).

- (2) lai2 le yi1-ge ren2  
 come PCL one-CL person  
 'A person came.'
- (3) ta1 lai2 kan4 ni3 le, ke3shi4 ni3 bu2 zai4  
 he come see you PCL but you not at  
 'He came to see you, but you were not in.'
- (4) you3 yi1-zhi1 gou3  
 have one-CL dog  
 'There is/was a dog.'

Note that the markings on New/Given information mentioned above primarily apply to simple nominals. We do not yet know whether these principles are applicable as well to complex nominals like Mandarin pre-nominal DE phrases. We will address this question in our data analyses.

## 2.2. Mandarin pre-nominal DE phrases

In Mandarin, complex nominals can be coded with a grammatical morpheme *de*, which serves as a marker in associative and modifying noun phrases as illustrated in (5a) to (5d).

### (5a) Possession (ownership)

xiao3 xiong2 de feng1-mi4  
little bear DE honey (little bear's honey)

### (5b) Possession (Part-whole relationship between physical objects)

xiao3 gou3 de wei3-ba1  
little dog DE tail (little dog's tail)

### (5c) Attribute

hong2 se4 de qi4-che1  
red color DE car (red car)

### (5d) Modification

chi1 fan4 de kuai4-zi  
eat rice DE chopstick (the chopsticks which are used in eating)

These pre-nominal DE phrases, all using uniform *X de Y* forms, can be categorized into at least three types of syntactic concatenation, corresponding to their individual syntactic categories, as shown in (6). Among them, (6a), (6b), and (6c) match possession, attribute, and modification respectively.

### (6) Pre-nominal DE strings in Mandarin

- a. N/Pron + DE + N
- b. Adjective + DE + N
- c. V + DE + N

Most previous work embarked on the investigation of Mandarin DE phrases from structural perspective. Some show major concern for the mapping between the uniform *X de Y* form and its various functions. Following this trend, developmental studies would address how children may progress from one pattern of function to another in acquisition (Chang & Huang, 1986; Erbaugh, 1992; Hsu, 1987). Other studies set out by observing the relation between the modifier *X* and the modified head *Y* in the *X de Y* structure. For example, Packard (1988) examined the use of DE with nominal head from 27 children in Taiwan, aged between 2;0 and 2;11. He found that in children's

spontaneous production, verbal modifiers tend to occur in lexically headless DE structures, i.e. V-DE-Ø, whereas nonverbal modifiers tend to occur in headed DE structures, i.e. N-DE-Head. This tendency is also reported in Wang's (1996) developmental study of DE in Mandarin-speaking children. Both studies explained the usage of head/headless DE structures from the form-oriented approach, attributing children's omission of head to their incompetent control of the headed DE structure.

As found in previous studies, the pre-nominal DE is of particular concern because the head noun following DE can be omitted in certain contexts. That is, both headed and headless DE forms in Mandarin discourse are permitted. In a given context, headed form in (7a) and headless form in (7b) refer to the same thing, and the headless form would not cause problems for listeners to interpret. For our present purpose, we intend to find out the determinants in deciding about the marking between headed DE and headless DE. Nevertheless, instead of departing from traditionally structural perspective, we would take the notion of discourse as a point of departure and investigate the DE phrases beyond the sentential level to a macro inter-sentential view.

- (7a) you3 da4 de jian3-dao1, xiao3 de jian3-dao1  
 have big DE scissor, small DE scissor
- (7b) you3 da4 de Ø, xiao3 de Ø  
 have big DE Ø, small DE Ø

### 2.3. Functional-discourse approach to the choice of complex nominals

We begin in this section with description on our attempt to use functional and discourse approach in the model of information flow to explain the marking of Mandarin head and headless DE. In fact, many factors of information flow have been proposed to play a role in motivating the choice of grammatical forms. Generally speaking, these factors are both cognitive and interactional, considering from speakers' assumption for the hearer's state of mind. In 2.3.1 we illustrate that grounding devices are available in one type of complex nominals in English, the relative clauses. Then in 2.3.2 we gave a brief review to prior research on Mandarin children's use of pre-nominal DE in spontaneous production, which helps shed light on the discourse approach to the head and headless DE issue.

### 2.3.1. Grounding device

In spite of few considerations being put on complex nominal forms, it has been observed that the choices of one type of “complex NPs” with modifying/attributing function, i.e. headed relative clauses in English, can be explained on discourse-level. The uses of differing relative clauses manifest the symptoms of interactants’ attention to information flow (Fox & Thompson, 1990).

Fox & Thompson (1990) collected 414 relative clauses from a corpus of natural conversations by native speakers of American English. Their data show that all NPs containing relative clauses are grounded. Namely, these referents are made relevant to the ongoing conversation by being explicitly related to Given referents in the discourse (Fox & Thompson, 1990:300). These grounding devices interact to contribute to the distribution of different relative clause types in the discourse.

For example, in the whole data set, nonhuman subject head tend to co-occur with object relatives (S-O), while nonhuman object head tend *not* to co-occur with object relatives (O-S), as exemplified in (8) (adopted from Fox & Thompson, 1990: 303-305).

(8a) *the car* that she borrowed had a low tire (S-O; nonhuman subject head + object relative)

(8b) he’s got--*a spring* [that comes, way up] (O-S; nonhuman object head +subject relative)

They explained that the preponderant choice of (8a) S-O is motivated by the principles of information flow. The nonhuman head NP ‘*car*’ was made relevant for the hearer by explicitly relating it to a Given discourse referent, i.e. the pronoun ‘*she*’, as pronoun has been proposed as the primary way to refer to Given referents (Fox, 1987). By linking the entity ‘*car*’ with another given NP (pronoun *she*) contained in the relative clause, the relative clause thus anchors the NP *car*, making the ‘*car*’ grounded.

The use of object relative in (8a) is because nonhuman referents are often made relevant in terms of the humans who own them, use them, and manipulate them (Du Bois 1980: 269-270). Therefore, the construction containing a pronominal subject with a verbal predicate, denoting human’s relevance to the entity, and an unexpressed object role (i.e. object relative) is chosen. As for speaker’s decision on the O-S form in (8b), it is again explained with cognitive and interactional factors. Since the main clause has been grounded with the pronoun ‘*he*’, there is no communicative need to ground the given referent. The relative clause here would not serve a grounding function, but a characterizing function. That the relative serves to characterize the NP can be evidenced

by the indefiniteness feature of the Head NP, *a spring*. That is, in (8b) the main clause provides the grounding information, while the relative clause provides the new information.

Fox & Thompson's study demonstrates that speakers constantly make decisions about their listener's state of knowledge, on the basis of which they make structural choices regarding the management of the flow of information.

### *2.3.2. Information status of head NP in Mandarin Pre-nominal DE*

As most of the studies on DE pay attention to the structural complexities of DE, little is mentioned on the discourse function. To our best knowledge, the only work in this regard is made by Cheung (1997), who challenged Packard's (1988) structural account and analyzed the NEW/GIVEN information status of DE in children's narrative data. Three functions of DE based on Dasinger and Toupin's (1994) classification were adopted, which were also a merge of Fox and Thompson's (1990) classification on information status and functional role. They are (a) situating new referent, (b) situating old referent, and (c) re-identifying old referent. The results show that although 4-to-6-year-old children used few headless DE phrases, these headless DE forms are frequently used for situating an old referent, providing more information on the entity which has been specified in the previous context.

Cheung's observations have pointed out that Mandarin children show sensitivity on the use of headless DE by following the general discourse functions in the information flow. This also leads to the direction that the choice of pre-nominal DE forms may be accounted for with the discourse-level explanations.

## **3. METHODOLOGY**

### *3.1. The Data base*

This study examines headed/headless DE phrases. Our DE phrases were selected from transcripts of naturally-occurring conversations of one mother-child dyad, recorded monthly over one year (aged 2;05 at the start and 3;04 at the end). The data includes face-to-face conversations and play session between mother and child. Most involve two participants: mother and child, but there are several with participants from the recorder and other family members. The current study only reports the structural and distributional characteristics of headed/headless DE forms made between mother and

child, due to scarcity of DE forms by other participants. The tokens of headed/headless DE in referring expressions regarding their information status used by mother and child were collected, transcribed according to the CHAT (Mandarin) and calculated with CHILDS program (MacWhinney, 2000a, b).

### 3.2. *Transcription and coding*

Mother and child's pre-nominal DEs were identified and coded except (a) DE as final particle, (b) in fixed expressions and in (c-f) conditions (based on the 10 DE patterns from Chang & Huang 1986). Four tiers of coding scheme were used for the discourse and cognitive factors in the current study. They are information status, mention status, modifier, and structural position.

(a) As final particle

ni3 shou1 bu4ke3yi3 de  
 you say no DE (You told me that it is prohibited.)

(b) In fixed expressions

zhen1 de  
 true DE (It's true.)

(c) In shi complement structure (shi-DE)

ta1 shi4 zuo2tian1 lai2 de  
 3S is yesterday come DE (It is yesterday when he came.)

(d) With manner adverb

pao3 de kuai4  
 run DE fast (run fast)

(e) In complex stative construction

ta1 ku1 de yan3jing1 fa1 hong2  
 3S cry DE eyes become red (Her eyes become red due to crying)

(f) in sentence linking

wou3 xiao3 de shi2hou4  
 I little DE time (the time when I was little)

### 3.3. *Overall data*

Background data is provided here for further analysis. Table 1 shows mother produced 2906 utterances and child produced 2687 utterances in total along the data collection period.

Table 1: Total utterances

Age	2;05	2;06	2;07	2;08	2;09	2;10	2;11	3;00	3;01	3;02	3;03	3;04	Total
Mother	497	154	200	182	199	256	209	396	272	286	98	157	2906
Child	619	206	202	190	205	181	191	172	215	182	192	132	2687

Table 2 gives an overall display of the child’s MLU in word across the observational period (2;05 to 3;04). As seen in Table 2, the child demonstrates a rise and fall pattern after 2;11, showing a normally developmental progress near age 3. Table 3 reports a month by month use of DE by mother and child. In general, headless DEs are used in fewer tokens than headed DEs over the one-year span for both mother and child, and this requires further analysis.

Table 2: Child MLU (Mean length of utterance) in word from the first 100 utterances in each age sample

Age	2;0	2;06	2;07	2;08	2;09	2;10	2;11	3;00	3;01	3;02	3;03	3;04	Average
MLU	3.38	3.45	3.5	3.39	3.45	3.32	4.15	3.26	4.4	3.04	3.4	4.19	3.5825
SD	2.04	2.02	2.1	1.87	2.15	1.97	2.09	1.85	2.5	1.86	1.7	2.37	2.047583

Table 3: Month by month use of DE

	Age	2;05	2;06	2;07	2;08	2;09	2;10	2;11	3;00	3;01	3;02	3;03	3;04	Total
Mother	Head	29	15	14	19	19	17	20	34	21	14	4	8	214
	Headless	27	5	2	1	12	6	11	2	2	4	3	2	77
Child	Head	25	19	9	8	6	6	11	5	14	4	1	12	120
	Headless	21	8	5	1	16	6	10	2	9	1	8	0	87

#### 4. DATA ANALYSIS

In section 4.1 we provide a quantitative analysis to the overall spontaneous production sample made by the mother and the child. A general conclusion to the distinctive use between head and headless DE from the perspective of information flow can be made. Then in section 4.2 we make a further analysis toward the marking between Head Given and Headless Given from the discourse perspective.

#### 4.1 Overall data analysis

##### 4.1.1. Frequency distribution of headed/headless DE patterns in the data

As seen in Table 4, mother produced 2906 utterances in total, among which 291 utterances (10.01%) contain headed or headless DEs. Child produced 2687 utterances, among which 207 utterances (7.7%) occur with headed or headless DEs. For headed/headless DEs, Child showed roughly equal percentage of headed and headless DE forms (+H:-H/57.97%:42.03%), while mother made more headed DE (73.54%) than headless DE (26.46%). Compared with child, mother uttered more headed DE than child, and in contrast, child made more head elision.

Table 4: Distribution of Headed/Headless DE

	MOT	CHI
Total Utterances	2906	2687
Head	214 (73.54%)	120 (57.97%)
Headless	77 (26.46%)	87 (42.03%)
Subtotal	291	207

At first sight, one may easily consider that child produces more headless DE due to the simplicity of form. However, as we analyze the data in regards to information flow, both mother and child demonstrate clear-cut distinction in choosing the DE forms concerning the first factor: new and given information status.

##### 4.1.2. Information status of pre-nominal de NP

First, we examine the head/headless DEs in their information status. The newly introduced pre-nominal DE phrases were coded as first mentioned NEW information in our data, and the subsequently mentioned ones were coded as GIVEN information. The distribution of pre-nominal DE as a function of new and given information status is shown in Table 5.

As can be seen from Table 5, mother and child show roughly similar tendency in using headed/headless DE regarding the information status. Headed DEs can be either used for NEW or GIVEN information in both mother and child's production, whereas headless DEs are primarily for GIVEN information, and headless DEs are scarcely uttered for NEW information (lower than 5%).

Table 5: Distribution of Headed/Headless DE as a function of NEW/GIVEN information status

	MOT (%)	CHI (%)
HeadNew	97 (33.33)	61 (29.47)
HeadGiven	117 (40.21)	59 (28.5)
HeadlessNew	6 (2.06)	8 (3.87)
HeadlessGiven	71 (24.4)	79 (38.16)
Total	291	207

A broad conclusion can be drawn from Table 5 that when it comes for new information, headed DEs are the preferred marking, as headless DEs are rarely chosen in presenting new information. So problems only arise when GIVEN information is encountered, which forms (headed or headless DE) should be chosen? To address the question concerning speaker's choice between head/headless DEs in terms of Given information, a series of factors will be examined in the following sections.

#### 4.2. *Specific factors*

In this section we argue that Mandarin pre-nominal DE phrases, unlike simple nominals, do not seem to rely on global or local marking to convey their information status. Instead, they depend more on the internal relation between modifier and modified in the *X de Y* form to show their information status. Furthermore, the use of Head or Headless Given relates tightly to the grounding devices.

##### 4.2.1. *Information status of pre-nominal DE phrases in global structure*

Li & Thompson (1981) has posited that in Mandarin global structure new information must be in post-verbal position, while subject position is usually preferred for given referent. This is because old or given referent is more likely to appear earlier so as to be accessible or salient to the listener. Therefore, sentence-initial position and grammatical subject status are thus reported to be able to establish sufficiently the prominence of the referential expressions. In contrast, new information is frequently presented later and grounded on the preceding given information. Thus, the object position is suggested to be of lower prominence and usually occupied by the new referent. However, we have to note that this generalization is made on the part of 'simple' nominal form. We wonder whether this principle is applicable to the 'complex'

pre-nominal DE construction.

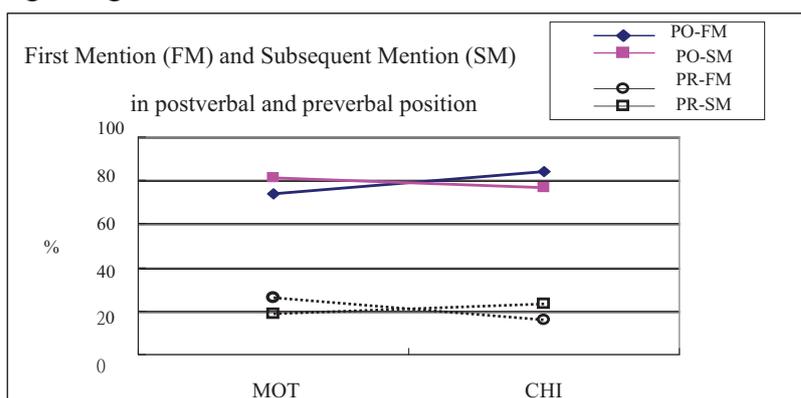

We categorize constructions containing DE into  $\pm$ verbal constructions and examined their grammatical roles. The +verbal construction is usually the canonical (S)-VO construction, and the subject/object position can be calculated. For the -verbal construction, the pre-nominal DEs mostly stand alone as a single phrase. Therefore, no grammatical role can be computed. The results are listed in Table 6.

Table 6: Distribution of DE phrases in  $\pm$  verbal construction

DE in $\pm$ verbal construction	MOT (%)	CHI (%)
(S)-VO construction (+verbal)	207 (71.13)	122 (58.94)
Others (-verbal)	84 (28.87)	85 (41.06)
Total	291	207

Table 6 indicates that both mother and child use headed/headless DE in +verbal constructions, accounting for at least over 50% in their communication. Figure 1 displays among the +verbal constructions the distribution of these headed/headless DEs occurring at preverbal and post-verbal positions as a function of their recent mention (either first mention-FM or subsequent mention-SM, which we view as new referent and given referent respectively).

Figure 1: Headed/Headless DEs in post-verbal (PO) and preverbal (PR) position regarding their mention status

Compare the solid lines indicating post-verbal position with dotted lines indicating preverbal position in Figure 1. It is obvious that both mother and child tend to produce pre-nominal DEs in post-verbal (PO) position, regardless of their mention status. This indicates that although post-verbal positions, regulated by general discourse principles, serve as a place for presenting new information, such a regulation may be merely

applicable to ‘simple’ nominals. Therefore, complex nominals such as Mandarin pre-nominal DE phrase do not seem to rely as much on global marking for information status as the simple nominals do.

#### 4.2.2 Information status of pre-nominal DE phrases in local structure

Then we examine one of the local marking in accordance with the information status, i.e. Mandarin definiteness marker, in the pre-nominal DE phrase. Table 7 illustrates the percentage that demonstrative (DEM) marker occurs in the headed/headless DE phrases in terms of the information status in our data. As is shown, mother produced 46 DEMs in the pre-nominal DE construction, and child uttered 50 tokens. In total, DEM (e.g. *zhe4*, this; *na4*, that) is frequently used with pre-nominal DE in GIVEN information. So given information can roughly correspond to the notion of definiteness in this case.

Table 7: Percentage of demonstrative (DEM) as a function of information status

	Information	DEM (%)
MOT	GIVEN	32/46 (69.57%)
	NEW	14/46 (30.43%)
CHI	GIVEN	41/50 (82%)
	NEW	9/50 (18%)

However, Mandarin doesn’t seem to rely heavily on the definiteness device in conveying the information in the local pre-nominal DE structure, as the DEM marker co-occurs with the pre-nominal DE only in nearly one out of five ratios (around 7.14% to 32.35%) across four modifier types in the pre-nominal DE forms, which is shown in Table 8. These four modifier-modified types, based on (6), can mostly account for the *X de Y* pre-nominal *de* form.

Table 8: DEM with DE modifier type

	DEM-PRON-DE	DEM-NP-DE	DEM-ADJ-DE	DEM-V-DE
MOT	9/98 (9.18%)	12/47 (25.53%)	5/70 (7.14%)	17/66 (25.76%)
CHI	17/79 (21.52%)	11/34 (32.35%)	10/42 (23.81%)	11/46 (23.91%)

As can be seen, the child shows a higher percentage in using DEM with pronominal modifier (DEM-PRON-DE) and adjective modifier (DEM-ADJ-DE) than mother. For DEM with nominal modifier (DEM-NP-DE) and verbal modifier (DEM-V-DE), both

mother and child show equal percentage. Overall speaking, the low percentage of the definiteness marker shows that the local device is not necessarily required in marking the information status of pre-nominal DE.

In general, our data show that the pre-nominal *de* phrases do not depend on local or global device to mark their information status. This indicates there might be other factor at work. We address this factor in the following section 4.2.3.

#### 4.2.3 Grounding and the type distribution of pre-nominal DE phrases

We calculated the distribution type of Head/Headless DE in accordance with GIVEN information status, which is shown in Table 9.

Table 9: Modifier type percentage of Headed/Headless DE in terms of GIVEN information status

	[±verbal] label	Modifier type	MOT (%)	± verbal (%)	CHI (%)	± verbal (%)
Head	- verbal	PRON-DE	39/291 (13.40%)	22.68%	26/207 (12.56%)	17.87%
		NP-DE	27/291 (9.28%)		11/207 (5.31%)	
Given	+verbal	V-DE	17/291 (5.84%)	15.81%	10/207 (4.83%)	10.14%
		ADJ-DE	29/291 (9.97%)		11/207 (5.31%)	
Headless	- verbal	PRON-DE	3/291 (1.03%)	2.75%	19/207 (9.18%)	15.46%
		NP-DE	5/291 (1.72%)		13/207 (6.28%)	
Given	+verbal	V-DE	36/291 (12.37%)	21.3%	24/207 (11.59%)	21.25%
		ADJ-DE	26/291 (8.93%)		20/207 (9.66%)	

Table 9 demonstrates that mother and child, intriguingly, show similar patterns in terms of Headed/ Headless DE in GIVEN information status. Head Given differs from Headless Given in two ways: More (-) verbal DE (i.e. PRON-DE/NP-DE) are used in Head Given, while more (+) verbal DE (i.e. V-DE/ADJ-DE) are used in Headless Given. This is consistent with Packard’s finding that headless DE forms were mostly used with verbal modifiers and headed DE with non-verbal ones. Nevertheless, Packard’s structural account that children use more headless DE forms preceded by verbal modifiers due to their incompetent control on the binding relation between head and the predicate argument in the verbal modifier seems not to be plausible, as in our data mother shows similar usage as does the child. One should not attribute adult’s usage to structural incompetence.

A more plausible interpretation would be, as we intend to suggest in this paper, a

discourse information account. The following examples (9) and (10) illustrate typical scenario in using Head Given and Headless Given in our data. Grounding device plays an essential role in explaining the usage.

(9) Head Given (Age 2;05 )

- 1 \*MOT: zhe4 ge she2me a ?  
this CL what UFP  
'What is this ?'
- 2 \*CHI: hua4 bu4 chu1lai2  
paint no out  
'It cannot paint.'
- 3 \*CHI: ke3shi4 hui4 hei1 ye  
but will black UFP  
'But it can paint into black.'
4. \*MOT: zhe4 ge bi3 yi3jing1 mei2 shui3 le. ← (First mention)  
this CL pen already no water UFP  
'This pen runs out of ink.'
5. \*CHI: **ta1 de zuei3ba1** shi4 she2me? ← (Further question)  
3S DE mouth is what  
'What is *its mouth*?'
6. \*MOT: **ta1 de zuei3ba1** jiu4 shi4 yi4 zhi1 bi3 a, ← (reply)  
3S DE mouth just is one CL pen UFP  
'Its mouth is exactly a pen.'
- 7 \*MOT: zhe4 shi4 yi4 zhi1 gou3gou3bi3 a.  
this is one CL dog pen UFP  
'This is a dog-pen.'

Our data show that Head Given relies more on PRON-DE than Headless Given. In (9) line 4, the referent *bi3* 'pen' is mentioned first into the conversation by mother. Then in line 5, the child asked a further question regarding the function pertaining to part of the pen. Finally, in the subsequent reply in line 6, mother replied by using the full headed DE form, which acts as a maintaining device for reintroducing the entity. Thus, the pronoun in the PRON-DE-Head string in line 6 serves as grounding information, and the Head in the Headed Given form achieves a maintenance function, building coherence for the re-introduction of the previously mentioned entity *bi3* 'pen' as the specific answer to the question.

(10) Headless Given (Age 2;06)

- 1 \*CHI: na4 nong4 hao3 chi1 de tang2tang2. ← (First mention)  
then make good eat DE candies  
'Then find some delicious candies.'
- 2 \*MOT: hao3.  
good  
'Ok.'
- 3 \*MOT: wa! zhen1 hao3 chi1 ye!  
wow really good eat UFP  
'Wow, this is delicious!'
- 4 \*CHI: **rou2rou2 zuo4 de** la! ← (specification)  
Name make DE UFP  
'This is made by rou2rou.'
- 5 \*MOT: ni3 zuo4 de tang2 a? ← (confirm by reintroducing)  
You make DE candy UFP

Headless Given occurs more with V-DE and ADJ-DE in our data. As shown in (10), child firstly mentioned the referent in a nominalization Headed DE structure in line 1. Then in line 4, the child specifies that these candies were made by her. A headless nominalization DE is used. The empty head is a given referent, which is properly anchored by the full name NP '*rou2rou2*' (the girl's name, known to mother but newly mentioned) contained in the nominalized relative clause. Thus the empty head is made relevant to the ongoing conversation by being linked to the situation provided by the relative clause which contains explicit nominal (*rou2rou2*) and predicate (*zuo4*). Namely, the whole relative clause provides grounding and it helps to specify the Given referent (*tang2*, candy) which has been previously known to mother. Nevertheless, when it comes eventually to confirm what the child said, the mother reintroduced the referent *tang2*, and used pronoun *ni3* (you) as a grounding in the relative clause.

## 5. Conclusion

In accordance with the information-flow patterns, we have shown that Mandarin pre-nominal headed/headless DE phrases are chosen for referential expressions according to the interactive and cognitive factors inherent in the process of communicating. A traditional perspective of 'structural complexity' in explaining the

grammatical patterns of pre-nominal DE phrases is challenged in this study. For one thing, one should not merely consider the headless '*X de Ø*' form as an elliptic counterpart to the full form '*X de Y*', and infer that the former is formally simpler than the latter for Mandarin learners/users. Our data show that the two conversationalists, mother and child, constantly make decisions about their addressees' state of knowledge, and on the basis of these decisions, they choose headed/headless DE forms to comply with the flow of information. When it occurs for a newly mentioned referent, i.e. new information, the headed DE forms must be used. From the speaker's point of view, the full pre-nominal DE with head is more informative to the listener.

For another, that the head marking between headed/headless DEs is not structurally determined can be evidenced by the results that the distribution of modifier type preceding DE is similar across mother's and child's production. In particular, when it comes for a verbal modifier preceding pre-nominal DE, both mother and child tend to use empty head in the construction, i.e. *V-DE- Ø*. Previous study made by Packard only examined children's utterances in conversation and suggested that children produced more headless DE forms first because they do not have a good command on the abstract binding relation between the head and its verbal modifier. This conclusion cannot be drawn given we observe that both mother and child show the same usage regarding the +verbal headless DE.

We observe that the marking of head in the pre-nominal de phrases regarding the information status is not tightly connected with the global or local devices. Rather, grounding device plays an essential role. Head Given depends more on locally preceding pronoun as a grounding device for the head. Head is hold for maintaining the referent in question. Headless Given prefers occurring in nominal V-DE construction. Nominalization also acts as a globally grounding device, which activates a propositional frame suggested by the verb and such a V-DE construction often provides a specification function as illustrated in (10).

In general, our findings provided supports in favor of the hypothesis that communicative factors are a major determinant of the referential choices between headed and headless DE forms in Mandarin discourse. While simple nominals may rely either on local or global device to mark the information status, the complex nominals such as pre-nominal DEs depend more on background task, i.e. grounding and discourse function to facilitate mutual understanding and interpretation on what speakers intend to talk about. Accordingly, this would affect what referential forms should be used.

## Abstract

This paper proposes that topicalization in the clausal domain is licensed by topicalization in the nominal domain. More specifically, it is argued that a noun phrase (NP) can move to a discourse-related specifier position of a functional projection in the clause (namely, TopicP) only after it moves to a specifier position of a functional projection in the nominal phrase (namely,  $D_{\text{Topic}}P$ ). Therefore, it is shown that the left edge of the determiner phrase (DP) fulfills the same grammatical role as that of the complementizer phrase (CP). This further suggests that the parallelism between CP and DP also holds at the level of information structure.

**Keywords:** topicalization, left periphery, Mandarin, DP.

## 1. Introduction

It is well-known that Chinese has a canonical Subject-Verb-Object (SVO) word order and that in Chinese the numeral-classifier sequence precedes the noun as shown in (1):<sup>2</sup>

- (1) Zhāngsān mǎi-le shí zhī bǐ  
Zhāngsān buy-Asp ten Cl pen  
'Zhāngsān bought ten pens'

However, it has also been noticed that the noun (i.e. *bǐ* 'pen') can appear in a pre-numeral position as in (2), a preverbal position as in (3), and a sentence-initial position

---

<sup>1</sup> I am grateful to David Willis, Niina Ning Zhang and Pei-Jung Kuo for helpful discussions and comments on this paper. Thanks also due to the audience at the 18<sup>th</sup> International Congress of Linguistics in Korea. All errors are mine.

<sup>2</sup> I use the following abbreviations in the gloss: Asp=Aspect, Cl=Classifier, DE=de (modifying marker).

as in (4):

- (2) Zhāngsān mǎi-le bǐ shí zhī  
Zhāngsān buy-Asp pen ten Cl  
'(lit.) Zhāngsān bought pens ten'
- (3) Zhāngsān bǐ mǎi-le shí zhī  
Zhāngsān pen buy-Asp ten Cl  
'(lit.) Zhāngsān, pens, bought ten'
- (4) bǐ Zhāngsān mǎi-le shí zhī  
pen Zhāngsān buy-Asp ten Cl  
'As for pens, Zhāngsān bought ten'

Concerning these four types of sentences, an important issue is how they are derived. More specifically, are they base-generated as distinct sentences, or are they transformationally related to each other? While Tang (1996) suggests that (1), (2) and (4) are transformationally unrelated, I propose that (1)-(4) indicate a successive-cyclic procedure of topicalization.

In section 2, I briefly introduce Tang's (1996) non-movement account and discuss a theoretical problem it faces in light of the current Minimalist program. In section 3, a phrasal movement analysis of (1)-(4) is postulated. Section 4 concludes by discussing some implications of my proposal.

## 2. Non-movement account

According to Tang (1996), there are actually three different constructions in (1), (2) and (4). In other words, these three examples are base-generated as distinct sentences, and no movement is involved in the derivation. What Tang suggests is that in (2) the numeral-classifier sequence *shí zhī* 'ten Cl' is syntactically base-generated as an adjunct argument of the verb *mǎi* 'buy' and is semantically predicated of the object *bǐ* 'pen'. As for (4), she maintains that the noun *bǐ* 'pen' is merged directly in the specifier (Spec) position of CP and is associated with a null noun within the postverbal nominal phrase, as shown in (5).

- (5) bǐ<sub>i</sub> Zhāngsān mǎi-le shí zhī *e<sub>i</sub>*  
pen Zhāngsān buy-Asp ten Cl  
'As for pens, Zhāngsān bought ten'

However, within the current Minimalist framework, Tang's non-movement analysis has to assume that a null noun also appears within the postverbal nominal

phrase in (2) and (3), or that a mechanism of NP ellipsis for the object DPs is involved in the derivation of (2) and (3). Otherwise, the formation of the object nominal phrases will become a problem, for there are only extended functional projections (i.e. DP), but no lexical projection (namely, NP). In contrast, what I argue for in the next section is a movement account. That is, (2) and (4) should be analyzed as being transformationally derived from sentence (1). More specifically, I propose that an NP like *bǐ* ‘pen’ can move to the left periphery of the sentence only after it moves to the left periphery of the nominal phrase. In other words, topicalization in the CP domain of Mandarin Chinese is licensed by DP-internal topicalization.

### 3. Phrasal movement analysis

#### 3.1. Topicalization

Wu (1998) argues that topicalization in Mandarin Chinese, as shown in (1) and (4), involves a movement operation for two reasons. First, island effects are found, as in (6) and (7):

(6)\**bǐ<sub>i</sub>* Lǐsì juéde bù gāoxìng yīnwèi Zhāngsān mǎi-le shí zhī *t<sub>i</sub>*  
 pen Lǐsì feel not happy because Zhāngsān buy-Asp ten Cl  
 Intended meaning: ‘Lǐsì felt unhappy because Zhāngsān bought ten pens’

(7)\**bǐ<sub>i</sub>* Lǐsì bù xiāngxìn Zhāngsān mǎi-le shí zhī *t<sub>i</sub>* de shuōfǎ  
 pen Lǐsì not believe Zhāngsān buy-Asp ten Cl DE claim  
 Intended meaning: ‘Lǐsì doesn’t believe the claim that Zhāngsān bought ten pens’

(6) indicates that the topic (i.e. *bǐ* ‘pen’) cannot be associated with the numeral-classifier sequence (i.e. *shí zhī* ‘ten Cl’) in an adjunct island, whereas (7) shows that the topic cannot be associated with the numeral-classifier sequence in a complex NP island. The analysis proposed by Tang (1996), shown in (5), fails to explain the island effects.

Second, unlike the topic sentence where the topicalized element is the whole nominal phrase, and, therefore, the gap can be filled by a resumptive pronoun (RP), as shown in (8), an RP cannot be inserted into the gap in sentences like (4), as shown in (9).

(8) shí zhī bǐ Zhāngsān mǎi-le (tāmen)  
 ten Cl pen Zhāngsān buy-Asp them  
 ‘The ten pens, Zhāngsān bought them’

(9) bǐ Zhāngsān mǎi-le shí zhī (\*tāmen)

pen Zhāngsān buy-Asp ten Cl (\*tāmen)

‘As for pens, Zhāngsān bought ten’

Given these two reasons, I maintain that the NP undergoes movement in the process of topicalization.

### 3.2. *Basic assumptions*

To further elaborate the process of topicalization in (1)-(4), I shall make the following assumptions about the internal structure of a nominal phrase in Mandarin Chinese:

- a. Mandarin Chinese, being a language without articles, also has the functional projection DP as the extended projection of the NP;
- b. DP is parallel to CP; both of them are phases;
- c. A particular layer of the CP, namely topic phrase (TopicP), is available for a topicalized element found in the left periphery of the clause.

There are several reasons for the first assumption. First, based on her study on Serbo-Croatian, an article-less language, Progovac (1998) maintains that the projection of DP is a property of Universal Grammar (UG). It is independent of the presence of an item in the lexicon that realizes the head of the projection. In addition, as proposed by Longobardi (1994), DP serves the deictic function, which refers or applies the description provided by the NP to the specific entity in the real or possible world. That the lexical element serves the function of description, whereas the functional element performs the referring or deictic function, has also been argued to be a property of UG (Cheng and Sybesma, 1999). As for the second assumption, it follows the line of research by Szabolcsi (1987) and Stowell (1989) that both CP and DP share the function of turning predicates into arguments. Furthermore, since Chomsky (2001) proposes that CP is a phase, Svenonius (2004) and Radford (2004) respectively argue that DP forms a phase as well.

Next, following Rizzi’s (1997) proposal, it is assumed here that CP can split into ForceP, TopicP, FocusP, TopicP and FiniteP. Except for FiniteP, each projection encodes a discourse-related property. Of primary interest are the TopicPs. Since SVO is the canonical word order for Mandarin Chinese, we have to assume that topicalization is involved in the OSV structure. Hence, I assume that the landing site for the topicalized element is the Spec of TopicP.

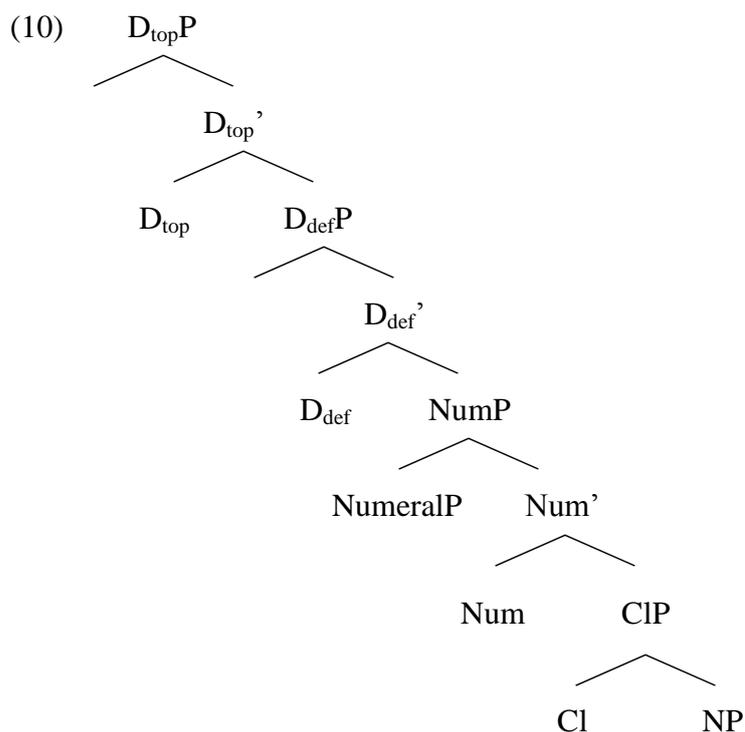

### 3.3. My proposal

Given the assumptions that DP is a phase and that topicalization is involved in the OSV structure, the direct extraction of noun out of the DP to the left periphery of the sentence, as shown by (4), will violate the Phase Impenetrability Condition, which does not allow an external probe (i.e. Topic) to attract anything from within the c-command domain of a phase head (i.e. D). In order to prevent this violation, I suggest that clausal topicalization in Mandarin Chinese must be licensed by nominal topicalization. In line with Aboh (2004), I suggest that the Spec of the functional head  $D_{top}$  is the escape hatch for the fronted NP in Mandarin Chinese.<sup>3</sup> The sentence order in (1)-(4) further indicates a successive-cyclic process of topicalization of the object NP in Mandarin Chinese. What I assume is that the edge feature [EF] of the functional head  $D_{top}$  triggers the movement of the NP to its Spec. Only after the object NP is moved to the edge of DP deriving the sequence Noun-Numeral-Classifier (i.e. *bǐ shí zhī*), is the topicalized NP then accessible to an external probe (i.e. Topic) in the clausal domain. As shown in (3) and (4), the NP undergoing topicalization further moves to the Spec of  $vP$  and finally reaches the Spec of TopicP.

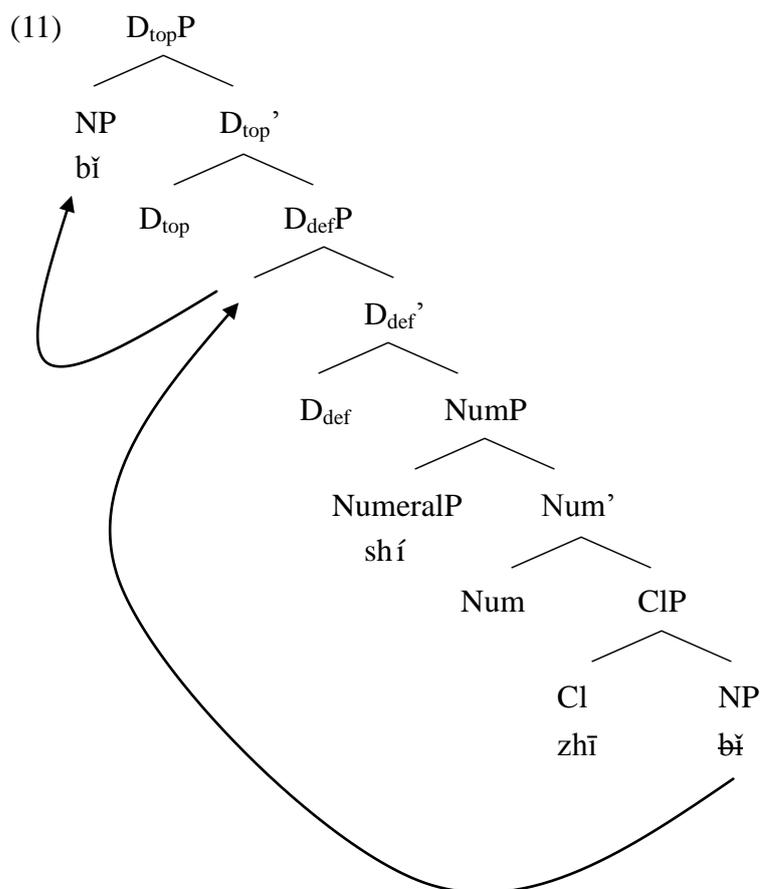

Based on Tang's (1990, 2005) and Li's (1998) studies, I propose that the nominal phrase of Mandarin Chinese has the internal structure illustrated in (10).

---

<sup>3</sup> Given Rizzi's (1997) split CP proposal, it is assumed in this paper that D can be decomposed into separate functional heads, namely  $D_{force}$ ,  $D_{top}$ ,  $D_{foc}$ ,  $D_{top}$  and  $D_{def}$ . Of primary interest are the  $D_{top}$ s.

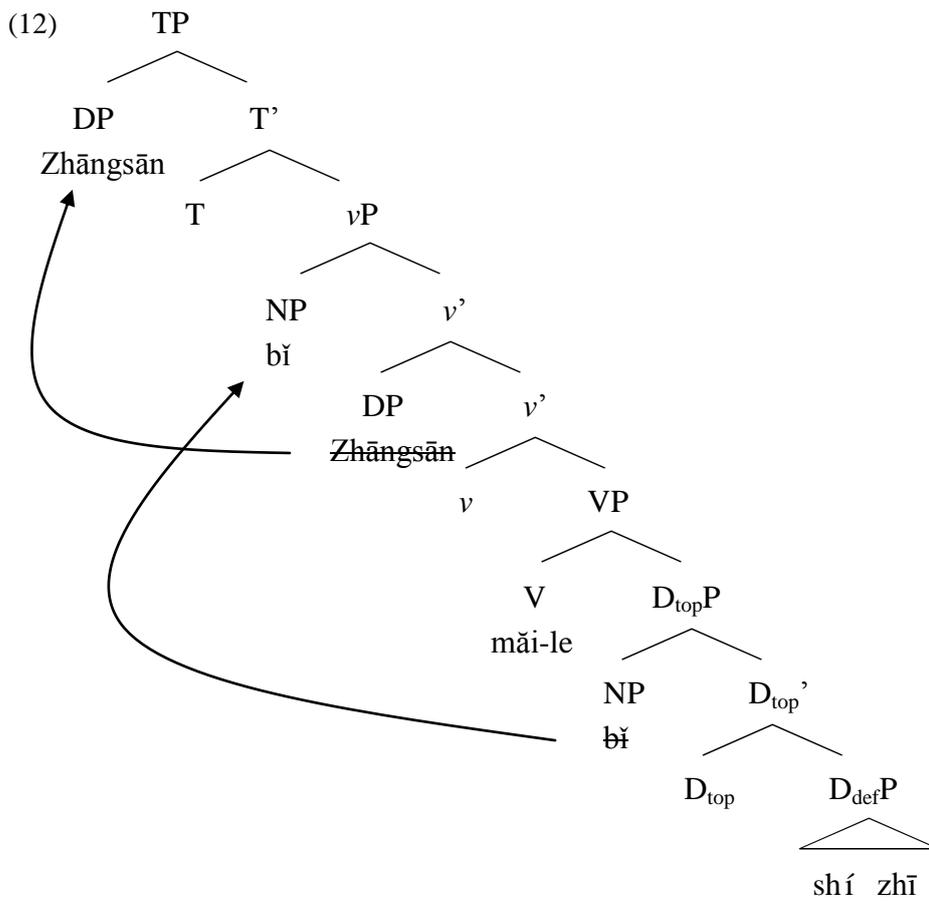

Given that (1) is the sentence with canonical word order, now let's turn to the derivation of the topicalization of *bǐ* 'pen' in (2)-(4). First, *bǐ* merges with a Cl *zhī* as its NP complement. The functional head Num then takes CIP as its complement. Next, the numeral *shí* 'ten' is merged in the Spec of NumP. Further, a null determiner merges with the NumP to form the D<sub>def</sub>P. After the formation of D<sub>def</sub>P (*shí zhī bǐ* 'ten pens') and the merging of D<sub>top</sub>, the [EF] feature carried by the D<sub>top</sub> triggers the movement of NP (*bǐ* 'pen') to its Spec position, as shown in (11).

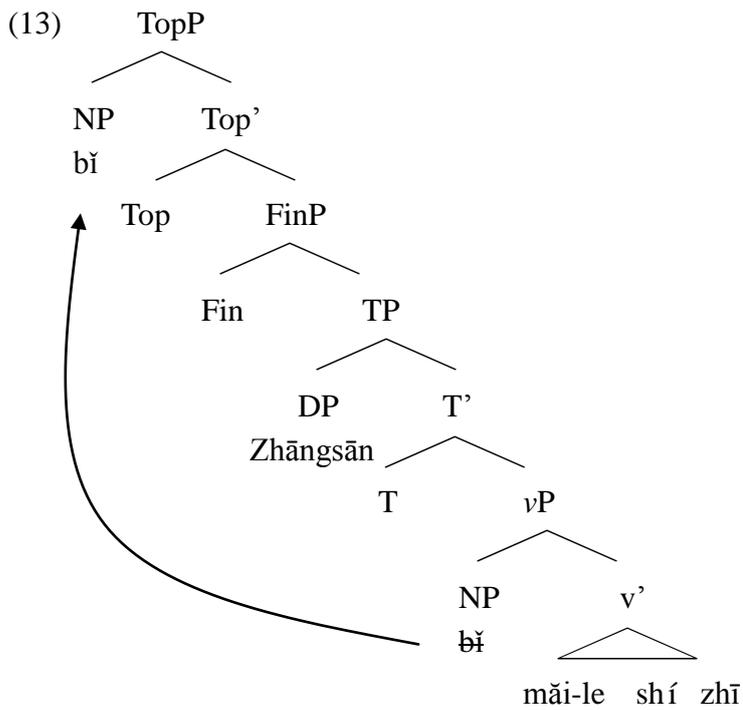

As it is at the edge of the derived DP, the NP is then accessible to an external probe in the clausal domain. The grammaticality of (2) supports such an analysis.

Next, since the transitive  $vP$  also forms a phase, the NP must move to the Spec of  $vP$  in order to be reachable to the external probe, Topic. The NP does move because of the [EF] feature carried by the transitive  $v$ . The well-formed (3), which has the stage of derivation shown in (12), predictably supports the current analysis.

Finally, at the stage of derivation shown in (13), the [EF] feature on the functional head Topic then attracts the NP to its Spec to derive (4).

As demonstrated above, topicalization in the CP domain of Mandarin Chinese indeed involves DP-internal topicalization.

Furthermore, the extracted NP and its associated numeral-classifier sequence can be separated from each other by one or more clauses, as shown in (14) and (15).

- (14) bǐ Lǐsì shuō Zhāngsān mǎi-le shí zhī  
 pen Lǐsì say Zhāngsān buy-Asp ten Cl  
 ‘Lǐsì said that Zhāngsān bought ten pens’
- (15) bǐ wǒ jìdé Lǐsì shuō Zhāngsān mǎi-le shí zhī  
 pen I remember Lǐsì say Zhāngsān buy-Asp ten Cl  
 ‘I remember that Lǐsì said that Zhāngsān bought ten pens’

According to the current account, this is predictable, for topicalization, being an instance of A-bar movement, is not subject to any locality condition.

The proposed analysis is not limited to the extraction of the object NP. The NP within the subject nominal phrase can also undergo topicalization, as shown in (16) and (17).

- (16) shí zhī bǐ jiù gòu le  
 ten Cl pen then enough Asp  
 ‘Ten pens will be fine’
- (17) bǐ shí zhī jiù gòu le  
 pen ten Cl then enough Asp  
 ‘(lit.) Pens, ten will be fine’

Similarly, the direct extraction of the noun out of the subject DP to the left periphery of the sentence will violate the Phase Impenetrability Condition. As a result, only after the subject NP has moved to the edge of DP, deriving the sequence Noun-Numeral-Classifier (i.e. *bǐ shí zhī*), is the topicalized NP then accessible to an external probe (i.e. Topic) in the clausal domain.

#### 4. Conclusion

This paper has discussed the derivation of four types of sentences, exemplified by (1)-(4). In contrast to Tang’s (1996) non-movement analysis, I propose a unified transformational account in terms of DP-internal topicalization. The main idea is that in Mandarin Chinese an NP can be extracted to the left periphery of the sentence only after it moves to the left periphery of the nominal phrase. It is shown that the edge of the nominal phrase fulfills the same grammatical role as that of the clause – both encode

topicality. This parallelism between CP and DP is revealed to hold as well at the level of information structure. On the other hand, one might ask if there is any constraint on the DP-internal topicalization, such as the Left Branch Condition. I will leave this question open for future research.

# Information Structure and Sentence Formation in Matengo<sup>1</sup>

Yoneda Nobuko

Osaka University

Osaka, Japan

yonedanb@world-lang.osaka-u.ac.jp

## Abstract

Matengo is a topic-prominent language. Topicalized items and non-topicalized ones are clearly distinguished by word order. The focus and non-focus items are also distinguished by word order, and the choice of verb form is involved in expressing the focal item. The treatment of focus, however, is not as rigidly controlled as topicalization. The informational value of focus is sometimes neglected in order to satisfy the syntactic conditions. Sentence construction in Matengo is achieved not by meeting one absolute condition, but rather by interactions between informational and syntactic requirements.

**keywords:** Matengo, topic, focus, conjoint/disjoint verb form

## 1. Introduction

Information structure plays an important role in determining sentence structure in Matengo, a Bantu language spoken in the southwest part of Tanzania. Word order in this language is determined by information structure, rather than grammatical relations. However, informational rules, although important, can be violated or eased in order to achieve syntactic requirements. This paper will discuss how information structure is involved in sentence formation, and how it interacts with syntactic constraints.

## 2. The Principles

The basic principles that determine word order in Matengo are:

- Topical elements occur before the verb, and non-topical elements occur after

---

<sup>1</sup> I would like to thank those who gave me helpful comments and suggestions at the congress. All the data in Matengo was collected through fieldwork in Tanzania by the author, with financial support of Grants-in Aid for Scientific Research (No.15251004 / 19520343). My deepest thanks go to John B. M. Kasuku, my language consultant in Litembo, Tanzania.

the verb.

- The focus of the sentence, if there is any, occurs immediately after the verb.

### 2.1. Position of the subject

Although the slot before the verb is the canonical place for the subject in many Bantu languages, it is the place for topic in Matengo (Yoneda 2007, 2008). Thus, the position of the subject differs depending on whether it is topicalized or not. The topical element is in boldface and the focused item is in italic in examples.

- (1) **María** ju-hík-ití. 'María' is topic  
Maria(1) SM(1)-arrive-PF<sup>2</sup>  
"(While Maria has been waited for) Maria has come."
- (2) Ju-hík-ití *Marî:a*. 'María' is not topic but focus  
SM(1)-arrive-PF Maria(1)  
"(Answer for "who has come?") Maria has come."
- (3) Ju-hík-ití mû:ndu. 'mundu' is not topic nor focus  
SM(1)-arrive-PF someone (1)  
"(Hearing unexpected knocking) Someone has come."

The subject is placed in the pre-verbal position in (1) because the subject is topicalized. The subject is not topicalized but is focused in (2), so it is placed in the post-verbal position. When the subject is neither topicalized nor focused as in (3), it is also placed in the post-verbal position.

### 2.2. Topicalization

Sentences (4a) and (5a) are examples of object topicalization and adverbial topicalization respectively. Notice that locative inversion, which is a very common phenomena in Bantu languages, does not occur in Matengo as shown in (\*5b).

- (4) a. **Kinûnda** lu-a-(mu-) lum-iti lúju:si.  
Mr. Kinunda(1) SM(11)-PAST-(OM(1)-)bite-PF bee(11)

---

<sup>2</sup> The abbreviations used in this paper are as follows: SM: subject marker, OM: object marker, PAST: past tense marker, NPF: non-perfect final, PF: perfect final, INF: infinitive prefix, Loc: locative, Neg: negative marker, The numbers in ( ) refer to the noun classes.

- "Mr.Kinunda, a bee stung (him)."
- cf. b. Lújusi      lu-a-mu-lum-iti      Kinû:nda.  
bee(11)      SM(11)-PAST-OM(1)-bite-PF      Mr. Kinunda(1)  
"A bee stung Mr. Kinunda."
- (5) a. **Mu-kítengu**      ga-a-tam-iti      máhi:mba.  
Loc-forest(18)      SM(6)-PAST-live-PF      lion(6)  
"In the forest, lions lived."
- b. \* **Mu-kítengu**      mu-a-tam-iti      máhi:mba.  
Loc-forest(18)      SM(18)-PAST-live-PF      lion(6)

(6) is an example of a sentence where the object is topicalized and the subject is focused. An example of a situation in which this sentence might occur is if you see many potatoes and yams, and ask who bought them. In such a case, word order must be OVS, although SVO is the canonical word order in many Bantu languages.

- (6) (Answer for "who bought these potatoes and yams?")

**Ílasí**      ju-a-hémél-aje      *Tóma:si,*  
potatoes(8) SM(1)-PAST-buy-NPF      Thomas(1)  
                 **íjabujabu**      ju-a-hémél-aje      *Marî:a.*  
                 yams(8)      SM(1)-PAST-buy-NPF      Maria(1)  
"Thomas bought potatoes, and Maria bought yams."

### 3. Elements of the topic slot

As we have seen above, in Matengo, each element in a sentence is assigned to a slot according to its information structure--namely whether it is topic, focus, or neither. For the non-topic/non-focus subject, however, the assignment of the slot involves another condition--that is, the presence or absence of other elements in the sentence.

#### 3.1. Non-topic/ non-focus subject

Both (7) and (8a) are answers for the question "What happened?" Therefore the whole sentence is new information and nothing is topicalized nor focused. When the non-topic/ non-focus subject is the only argument NP of the verb, then it occurs after the verb, as in (7). It follows the word-order principles in Matengo. But when the sentence

has another non-topic element as in (8), then the non-topic/ non-focus subject must occur before the verb, even it is not topicalized. It does not abide by the principles, but if the subject occurs after the verb in this case (thus, when other non-topic elements than non-topic subject are present in the sentence), then the subject is automatically interpreted as a focused element, as shown in (8b).

(Answer for "What happened?")

(7) Ju-a-hagak-iti            mwâ:na.

SM(1)-PAST-fall-PF child(1)

"A child fell down."

(8) a. Mwáná ju-a-hagak-iti            mú-nko:ngu.

child(1) SM(1)-PAST-fall-PF from-tree

"A child fell out of the tree."

cf. b. Ju-a-hagak-iti            mwáná    múnko:ngu.

SM(1)-PAST-fall-PF child(1) from-tree

"(Answer for "Who fell out of the tree?") *A child* fell out of the tree."

### 3.2. Topicality of the subject

The phenomenon of (8) shows that the subject always has the possibility of being treated as the topic (or at least as a suitable element for the topic slot) unless it is specifically expressed as the focus in Matengo. This can be considered to be the result of the highest degree of topicality that the subject inherently possesses.<sup>3</sup>

When a sentence has a topicalized element, the element occurs in the topic slot. However, when the sentence does not have a topicalized element and has two or more non-topical elements, the element that has the inherently higher topicality--namely the subject--is treated as the topic and occurs in the topic slot. In other words, the element that occurs in the slot before the verb is not limited to an intentionally topicalized element, but "an element that is high enough in topicality" is also a strong candidate; and the subject inherently possesses topicality high enough to be eligible for the topic slot, unless it is in focus.<sup>4</sup>

---

<sup>3</sup> It has been said that, cross-linguistically, the subject is the most typical topic (Givón 1976, Lambrecht 1994, etc.).

<sup>4</sup>See Yoneda(2007, 2008) for more detailed discussion on this issue.

## 4. Focus and Verb Forms

### 4.1. the Conjoint verb form

Matengo's word-order principle "non-topical elements occur post-verbally" allows two types of non-topical elements to occur after the verb. The first type is a focused element, such as indicating contrast as shown in (9), or the answer to a WH question as shown in (10). The other type is an element that is neither focus nor topic, as in (11) and (12). Example (11) consists of only new information throughout the whole sentence, and so no single element is in focus. In (12), the element after the verb is an indefinite noun, which usually cannot be considered to be a focus.

<focus>

(9) Ju-a-lel-aje                      *Tómasi*      nga:      Marî:a.  
SM(1)-PAST-cry-NPF    Thomas(1)    Neg      Maria(1)  
"Not Maria but Thomas cried."

(10) Ju-í-kelabuk-aje              *kilâ:bo*.  
SM(1)-FUR-return-NPF    tomorrow  
"(Answer for "when will he come back?") He will come back *tomorrow*."

<non-topic/non-focus>

(11) Ju-a-lí-hejul-iti                      mwâ:na.  
SM(1)-PAST-ref.-hurt-PF    child(1)  
>("What has happened?") My child hurt himself."

(12) Ju-hík-ítí                      mû:ndu.                      (=3)  
SM(1)-arrive-PF    person/someone(1)  
"(Hearing the sound of knocking) Someone has come."

Here, information structure affects the choice of verb form. To put focus on a certain element as in (9) and (10), the verb form with the suffix *-aje* is used. In the sentence without a focused element, the verb form with the suffix *-iti* is used.

*-aje* is a suffix used for the non-perfect verb form, and *-iti* is the suffix indicating the perfect verb form. They are usually used to convey different aspectual information. But the difference between the non-perfect form and the perfect form is often simply the presence or absence of the focused elements, rather than an actual aspectual difference. The verb form with *-aje* always requires the element to occur immediately after it, and it

is usually used to express the focus. Similar verb forms can be observed in some other Bantu languages such as Makhuwa (van der Wal 2006), Matuumbi (Odden 1984), Zulu (Buell 2006). It is called a "focal form" because of its function, or a "conjoint form" because of the syntactic characteristic that prohibits the verb from occurring at the sentence-final position. I will call this form "conjoint form" in this paper. The conjoint form cannot occur in the sentence-final position and always requires an element after it. Also, that element has to carry enough information to qualify as a focus. Therefore, the conjoint form involves both a syntactic requirement and an informational requirement. The verb form that doesn't have such a condition is called the "disjoint form."

The verb in (13a) is in the non-perfect form (conjoint form). When the verb in the conjoint form has only one argument NP, topicalization of the NP is syntactically precluded, as shown in sentence (\*13b) because that NP must stay after the verb. When the sole NP needs to be topicalized, the alternative verb form such as the perfect form (disjoint form) must be used, as in (13c).

- |         |  |   |                             |
|---------|--|---|-----------------------------|
| (13) a. | N-a-golol-aje<br>SM(1sg)-PAST-wash-NPF | <i>lúha:gi.</i><br>plate(11)            | (non-perfect/conjoint form) |
|         | "I washed a plate."                    |   |                             |
| b. *    | <b>Lúhagi</b><br>plate(11)             | n-a-golol-aje.<br>SM(1sg)-PAST-wash-NPF | (non-perfect/conjoint form) |
|         | (The plate, I washed (it).)            |   |                             |
| c.      | <b>Lúhagi</b><br>plate(11)             | n-a-golol-iti.<br>SM(1sg)-PAST-wash-PF  | (perfect/disjoint form)     |
|         | "The plate, I washed (it)."            |   |                             |

Moreover, even if the verb is followed by a word and the sentence meets the syntactic requirement, the sentence is not considered as a well-formed sentence if the word does not satisfy the informational requirement of the focus. In the sentences in (14), the noun *mundu* occurs immediately after the verb. (14a)--with the conjoint form--is appropriate for expressing the idea that Samuel beat a human, not an animal; however, the degree of acceptability is much lower when the same sentence is used to state that Samuel beat someone, that is, a person about whom nothing is known. This is because the indefinite noun "someone" does not have enough information to meet the necessary conditions to be a focus.

- (14) a. ?Samuéli ju-a-mu-lapul-aje *míndu.* (conjoint form)  
 Samuel(1) SM(1)-PAST-OM(1)-beat-NPF person/someone(1)
- b. Samuéli ju-a-mu-lapul-iti *múndu.* (disjoint form)  
 Samuel(1) SM(1)-PAST-OM(1)-beat-PF person/someone(1)  
 "Samuel beat someone."

The conjoint form does not allow just any word to occur immediately after it, but it requires the following word to have enough information to be a focus. When the word that occurs immediately after the verb does not have enough information to be a focus, a disjoint form such as the perfect verb form in (14b) is preferred.

#### 4.2. Priority of the conditions

Now as I have shown, the conjoint form needs to meet both the syntactic requirement and the informational requirement. But the informational condition is not as strict as the syntactic condition, as shown by the contrast of (13b) and (14a). Example (13b), which doesn't meet the syntactic condition, is completely unacceptable, while (14a), which doesn't meet the informational condition, is *not* completely unacceptable, although this sentence is not preferred. Let's look at other examples.

- (15) a. N-a-heng-aje líhe:ngu. (non-perfect/conjoint form)  
 SM(1sg)-PAST-work-NPF work(5)  
 "I worked."
- b. \* N-a-heng-aje. (non-perfect/conjoint form)  
 SM(1sg) -PAST-work-NPF
- c. N-a-heng-iti. (perfect/disjoint form)  
 SM(1sg) -PAST-work-PF
- d. N-a-heng-iti líhe:ngu. (perfect/disjoint form)  
 SM(1sg) -PAST-work-PF work(5)

In (15a), *lihengu* "work" occurs immediately after the verb. Since the verb *-heng-* means "to work," the NP *lihengu* does not provide any new information. Therefore, in fact, it does not satisfy the informational requirement to be a focus. However, (15a) is acceptable. On the other hand, (15b) is ungrammatical because the verb does not have a word following it, and therefore does not meet the syntactic requirement.

From these observations, we could postulate that in the use of the conjoint form,

the syntactic requirement has priority over the informational requirement. If there is no appropriate NP to put after the verb, then disjoint form have to be chosen to abide by Matengo's word-order principle. However, if disjoint forms are not suitable and cannot be chosen, it's also possible to place a word that does not meet the informational condition in the focus position as a "dummy" in order to satisfy the syntactic requirement. Even a verb can be used as a dummy focus.

- (16) a. Maria ju-a-tend-aje ku-pomule:la.  
 Maria(1) SM(1)-PAST-do-NPF INF-rest  
 "Maria rested/was resting."  
 cf. b. \*Maria ju-a-pomulel-aje.  
 Maria(1) SM(1)-PAST-rest-NPF  
 (Maria rested/was resting.)

(16a) is an example of the use of a verb as a dummy focus. The verb *-tend-* "to do" in the conjoint form, and the addition of a verb in infinitive form immediately following *-tend-* creates a compound verb form, which is used when the focus is on the action of the verb itself. However, it is also often used to prevent the conjoint form from occurring in the sentence-final position, thus satisfying the syntactic requirements for well-formedness. Of course (16a) is used when putting focus on the verb *-pomule-* "to rest," such as in the answer to the question "what was Maria doing?" However, this sentence is also used even when there is no focus on *-pomule-* if there is no other optional NP to be placed after the verb *-pomule-*. This use of a verb as a dummy focus occurs especially with intransitive verbs.

#### 4.3. the Disjoint form

While the non-perfect form (the conjoint form) of the verb always requires an element to follow it, the perfect form (the disjoint form) has no such syntactic constraints. Thus, (15c) is a well-formed sentence. Moreover, unlike the conjoint form, the perfect form does not have requirements on the informational value of the element that occurs after it, so that (14b) is also a well formed sentence.

As I have mentioned above, the conjoint form is basically used to express focus, but it is also possible to express the focus with the perfect form, that is, the disjoint form. Example (17a) has the verb in the perfect form and focus is placed on *musumba senze* "in this room."

- (17) a. Ju-gonel-ití      *mu-súmba*      *se:nze*.  
 SM(1)-sleep-PF    Loc-room(18)    this  
 "(Answer for "where is she sleeping?") She is sleeping in this room."
- cf. b. Ju-gonel-adjé      *mu-súmba*      *se:nze*.  
 SM(1)-sleep-NPF    Loc-room(18)    this  
 "(Answer for "where does she usually sleep?") She sleeps in this room."

#### 4.3. Comparison with Makhuwa

Now we have seen that the conjoint form in Matengo can permit a dummy focus NP, and the disjoint verb form can sometimes be used to express focus. Therefore, in Matengo, while topicality is clearly coded by word order, the treatment of focus does not seem to be as strictly controlled as topic is. This is in contrast to other related languages such as Makhuwa.

In Makhuwa, in order to express focus, the conjoint form must be used. This verb form must be followed by an element and the element is rigidly required to have informational value as focus as in (18a). Example (18b) does not have an element after the verb, and therefore is ungrammatical.

When there is no focal element that follows the verb, the disjoint form must be used. The disjoint form is used when there is no element following the verb as in (18d), or when the element that follows the verb is not in focus as in (18c). Therefore unlike Matengo, the disjoint form is not used to express focus, and focus is expressed by the conjoint verb form exclusively.

- (18) <Makhuwa>      (van der Wal 2006)
- conjoint form
- a. enyómpé    tsi-n-khúúrá      *malashí*.      "The cows eat *grass*."  
 cows(10)    SM(10)-PRES-eat    grass
- b. \* enyómpé    tsi-n-khúúrá.      (The cows are eating.)  
 cows(10) SM(10)-PRES-eat
- disjoint form
- c. enyómpé    thi-náá-khúúra      *malashí*.      "The cows eat *grass*."  
 cows(10)    SM(10)-PRES.DJ-eat grass
- d. enyómpé    thi-náá-khúúra.      "The cows are eating."  
 cows(10)    SM(10)-PRES.DJ-eat

In comparison with Makhuwa, the treatment of focus is not rigidly controlled in Matengo. In Makhuwa, the conjoint form does not permit a dummy focus, and the disjoint form cannot be used to express focus. On the other hand, in Matengo, the conjoint form accepts a dummy focus, and the disjoint form can be used to express focus. This seems to be the result of restrictions on each form relating to what types of tense and aspect they may mark.

In Makhuwa, both the conjoint form and the disjoint form can be used to mark the same tense and aspect. Thus, when a focalized element follows the verb, the conjoint form can be exclusively used, and when there is no element following the verb, or when the element that follows the verb is not focalized, the disjoint form is used.

(19) A Comparison of the Conjoint/Disjoint forms in Makhuwa and Matengo

	Conjoint form		Disjoint form	
	non-perfect	perfect	non-perfect	perfect
Makhuwa	✓	✓	✓	✓
Matengo	✓	X	X	✓

In contrast to Makhuwa, the conjoint forms and the disjoint forms do not exist in a parallel relationship in Matengo, as shown in (19). For example, in the past tense and present tense, the conjoint form can only be non-perfect, while the disjoint form can only be perfect. Therefore, combinations of the conjoint form and a dummy focus, and a disjoint form and a focus, are used to bridge the gap. If the verb does not have a focused element following it, and perfect form is not appropriate, then a dummy focus is used to compensate. Also, when the verb is of the type that often occurs in the perfect aspect, and the sentence has focus, the perfect form, that is disjoint form must be used to express the focus. Example (17), for instance, has a different meaning if the non-perfect form--that is, the conjoint form--is used.

## 5. Conclusion

I have tried to show how information structure is involved in sentence formation, and how it interacts with syntactic constraints in Matengo. In Matengo, the information structure plays an important role in determining sentence structure. It is involved not only in word order but also in the choice of verb form. Both topic and focus are distinguished in this language, but the treatment of focus is not as rigidly controlled as

topicalization. That seems to be the result of the fact that the conjoint and disjoint verb forms do not exist in a parallel relationship in Matengo. The informational value of focus is sometimes neglected in order to satisfy the syntactic condition. Sentence construction in Matengo seems to be achieved not by meeting one absolute condition, but rather by more complex interactions between informational and syntactic requirements.

# Exhaustive Focus in Japanese\*

Yoshihisa Kitagawa

Department of Linguistics  
Indiana University, Memorial Hall 322  
Bloomington, IN 47405-7005, USA  
kitagawa@indiana.edu

## Abstract

It will be pointed out, first, that, in Tokyo Japanese, some extraordinary focus prosody induces exhaustivity of a focus interpretation in general and, second, that this correlation obligatorily holds for a matrix Wh-question but not for a subordinate Wh-question. To support these claims, various arguments will be provided based on phonetic experiments as well as semantic/pragmatic considerations. Possible syntactic analyses of these phenomena will also be briefly explored at the end.

**Keywords:** (exhaustive) focus, focus prosody, Wh-question, matrix phenomenon, performative analysis

## 1. Introduction and Background

There seems to be a growing sentiment among generative grammarians which alerts us to the danger of the syntactic investigation of sentences without paying proper attention to the information packaging and its associated prosody involved there. These non-syntactic factors are known to have significant effects on the speakers' judgments of sentences, and it seems to be the case that the information structural problems have often been mistaken for ungrammaticality even in published works. Paying heed to this warning, this paper makes a progress report on the study of some interesting correlation between prosody and the interpretation of a focused item encoded in some specific syntactic constructions in Japanese.

I would like to start the investigation by clarifying the definition of some informational structural terms that I will adopt in this work. First, the term *focus* will be used when and only when the notion "set of alternatives" is induced in the interpretation of a *sentence* along the line of Chafe (1976: 33-35) and Rooth (1992: 76-7). Furthermore, a Wh-interrogative expression and the item providing its identity in the answer are both regarded as a focused item along the line of Hamblin (1973).

Following partly and extending Krifka (2007: 33), focus is regarded as *exhaustive* if it involves a clear implicature that *only the proposition that becomes true with the selected alternative (= focus denotation) is the context change potential of the utterance*, and that *none* of the propositions that become true with the selection of any of the *actually unselected alternatives* is the context change potential of the utterance.

Along the line of Fuchs (1984), it is also assumed that one or more constituents of every syntactic *phrase* are always *informative* (i.e., informationally weighty, salient and/or relevant) in a given utterance. Informativity is independent of focus or discourse-giveness or -newness,<sup>i</sup> but an informative item becomes prosodically prominent by virtue of resisting prosodic reduction at each prosodic phrase (Kitagawa (2008).

While the definitions of the information structural terms presented above may or may not be appropriate and fully justifiable, they should at least clarify what I have in mind when I mention these terms in this work and allow us to avoid unnecessary confusion and misunderstanding. For this reason, I will also refrain from using the terms often found in the literature like "emphatic focus," "contrastive focus," "presentational focus," "identificational focus," and "informational focus."

## 2. Two types of focus

### 2.1 E-FPD vs. N-FPD

It has been observed in the literature that focus in *Tokyo* Japanese (henceforth referred to simply as Japanese) induces a distinctive prosodic pattern. For example, both Wh-focus in a question and the focused word providing its identity in the answer as in (1) below are assigned prosodic prominence with a somewhat high pitch peak and intensity on these items (indicated by SMALL CAPITALS), which is followed by "post-focal reduction" — significant compression of the pitch range of the items following them (indicated by **shades**). (' indicates the position of a lexical accent.)

(1) A: Kyoo-wa DA're-ga kita-no?  
 today-TOP who-NOM came-Q?

B: Kyoo-wa ME'arii-ga kimasita.  
 Mary-NOM came

'Who came at 9 o'clock? Mary came.'

Throughout, I will refer to a focus prosodic pattern like these as Focus Prosody (henceforth *FPD* for short).

With this observation as background, what I have noted and would like to pay close attention to in this work is, first, that we can elevate the level of prosodic prominence of a focused item even higher by adding extra rise of pitch and intensity (indicated by **BOLD FACE CAPITALS**) as in (2).

(2) Kyoo-wa **ME'**arii-ga kimasita.

'No one else but **MARY** came today.'

And, second, that such an extra focus prominence seems to semantically indicate the exhaustivity of focus — in this particular case, implicating that "**MARY**, *not anyone else*, came." A similar point can be illustrated even more clearly by the contrast between (3) and (4) and that between (5) and (6).

(3) < A conversation between two nurses >

A: 201-goositu-no kanzya-san-wa bangohan-ni **nani**-o tabe-masita-ka?  
 201-room.number-GEN patient-TOP supper-for what-ACC ate-Q?

B: oNI'ku-o tabe-masita.  
 meat-ACC ate

'What did the patient in Room 201 eat for supper? She ate meat.'

(4) 201-goositu-no Yomasita-san-wa kyoo-wa tyoosi-ga iidesuyo.  
 201-room.number-GEN Yamashita-TOP today-TOP condition-NOM good  
 Nanisiro oNI'ku-o tabe-masita-kara.

for meat-ACC ate-because

'Mr. Yamashita in room 201 is doing well today, for he ate **MEAT**, *not any ordinary hospital food*.'

(5) A: Anata-wa **donna**-kuruma-ni notteru-no?  
 you-TOP what.sort-car-in ride-Q

B: Boku-wa PO'rusye-ni nottemasu.  
 I-TOP Porsche-in riding

'What kind of car do you drive? I drive Porsche.'

(6) Ano hito-wa kanemoti-da-to omouyo.  
 that person-TOP wealthy.is.that think

Datte **PO'**rusye-ni notteru-mon.  
 for Porsche-in riding

'I think he is rich, for he is driving a **PORSCHE**, *not any ordinary car*.'

Here, the prominent items in (3B) and (5B) straightforwardly indicate the selected alternatives as the answers to the Wh-questions without any other special implicature involved. The extraordinarily prominent items in (4) and (6), on the other hand, involve a strong flavor of the exhaustivity of focus, implicating something like "meat, (which is

only for healthy people,) not any ordinary hospital food" and "Porsche, (which is a very expensive sports car,) not any other ordinary car," respectively.

In short, the extraordinarily enhanced FPD seems to prosodically indicate the semantic interpretation of exhaustive focus, which the regularly observed FPD does not achieve. I will refer to the former prosodic pattern as "*Exhaustive Focus Prosody*" (henceforth *E-FPD*) and the latter as "*Neutral Focus Prosody*" (henceforth *N-FPD*).

## 2.2 Semantics of *E-FPD*:

We can confirm that the exhaustivity of focus (as defined in Section 1) above is induced by *E-FPD* but not by *N-FPD*, appealing to the test offered by Szabolcsi (1994: 519). First, the focus consisting of a coordinated DPs in (7B-i) as an answer to a Wh-question (7A) allows us to infer (7B-ii) as its logical consequence. The discourse (i)-(ii) therefore can be interpreted naturally when eating raisins is an implicit issue.

(7) A: Kanozyo-wa NA'ni-o tabemasita-ka?

she-TOP what-ACC ate-COMP<sub>Wh</sub>

'What did she eat?'

B: (i) Kanozyo-wa [ RE'ezun-to PI'inattu ]-o tabemasita.

she-TOP raisin-and peanut-ACC ate

'She ate raisins and peanuts.'

(ii) Dakara tasikani kanozyo-wa [ RE'ezun ]-o tabeteimasu.

hence surely she-TOP raisin-ACC has.eaten

'Therefore, she certainly has eaten raisins.'

When the *N-FPD* in (7B i-ii) is replaced by *E-FPD* as in (8 a-b) below, on the other hand, the discourse cannot flow naturally.

(8) a. Kanozyo-wa [ RE'ezun-to PI'inattu ]-o tabemasita.

'It was **RAISINS AND PEANUTS** that she ate.'

b. #Dakara tasikani kanozyo-wa [ RE'ezun ]-o tabeteimasu.

'Therefore, it certainly was **RAISINS** that she has eaten.'

The problem here arises presumably because the exhaustivity of focus involved in both sentence in (8) does not permit the inference relation between them — (8a) implicates that raisins and peanuts were all and only food eaten while (8b) implicates that raisins were the only food eaten, inducing a contradiction.

To sum up so far, we should recognize and distinguish in Japanese two distinct types of focus prosody, *N-FPD* and *E-FPD*, only latter of which seems to induce exhaustivity of focus. *E-FPD*, in other words, marks exhaustive focus in Japanese.

### 3. Two types of FPD for Wh-focus

#### 3.1 Prosody-scope correlation in Wh-focus

Nishigauchi (1990, 33) reports that Subjacency sentences in Japanese become acceptable only with "a *marked intonation with a heavy stress* on the interrogative word which purports to have matrix scope."

- (9) Keesatu-wa [ kanozyo-ga ano-ban DA're-to atteita-**ka** ] sirabeteiru-**no**?  
 police-TOP she-NOM that-night who-with seeing-COMP<sub>Whr</sub> checking-COMP<sub>Wh</sub>

'Who<sub>1</sub> is s.t. the police are investigating [*whether* she was seeing him<sub>1</sub> that night]?'

He correctly recognized the need for prosodic prominence of a Wh-word for its proper interpretation in an interrogative sentence. It was overlooked, however, that such Wh-prominence as a type of focus prominence must be also accompanied by the post-focus reduction (= the shaded part) stretching to the matrix interrogative COMP with which the Wh-focus is associated for its scope interpretation.

We can also confirm that it is a mistake to regard such focus prosody to be a *marked* intonational pattern that is appealed only to override the Subjacency condition, when we observe that a similar prosodic pattern, i.e., FPD, is required for Wh-scope extraction in general — even out of a non-island *declarative CP* as in (10).

- (10) Keesatu-wa [ kanozyo-ga ano-ban DA're-to atteita-**to** ] kangaeteiru-**no**?  
 -COMP<sub>That</sub> think-COMP<sub>Wh</sub>

'Who<sub>1</sub> do the police think [*that* she was seeing t<sub>1</sub> that night ]?'

Furthermore, FPD is observed even when the Wh-phrase located within the subordinate clause takes subordinate scope as in (11) below. Notice that the surface form is identical in (11) and (9) except for the length of FPD — the post-focal reduction ends at the *subordinate* interrogative COMP *-ka* in (11), whose termination is marked by the *unreduced* accent of the matrix predicate *sira'beteiru* 'investigating'.

- (11) Keesatu-wa [ kanozyo-ga ano-ban DA're-to atteita-**ka** ] sira'beteiru-no?  
 -COMP<sub>Wh</sub> checking-COMP<sub>YN</sub>

'Are the police investigating [*who*<sub>1</sub> she was seeing t<sub>1</sub> that night ]?'

Crucially, (9) is interpreted as a matrix Wh-question and (11) as a yes-no question.

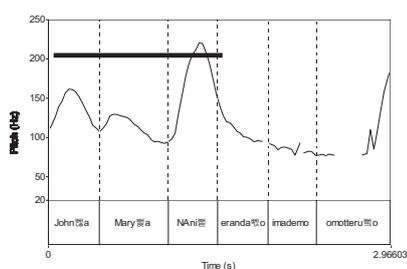

What all these observations indicate is that there is one-to-one correspondence between the domain of focus prosody and the domain of Wh-scope. As has been pointed out by Deguchi and Kitagawa (2002), Ishihara (2002) and Ishihara (2003), when FPD stretches through the end of the matrix clause as in (9)-(10), the Wh-interrogative expression that starts this prosodic pattern takes the matrix clause. When FPD is

terminated at the end of a subordinate clause as in (11), on the other hand, the Wh-interrogative expression takes subordinate scope. Throughout, I will refer to the former type of FPD as "*Global FPD*" and the latter type as "*Local FPD*."

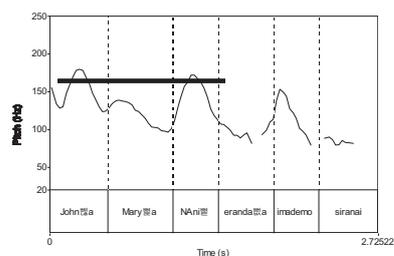

### 3.2 *Phonetic Experiment:*

Through several independent experiments which examined other people's and my own recording of Wh-interrogative sentences, I have noted that the prosodic prominence of the Wh-focus in *Global FPD* tends to be realized noticeably higher in pitch than that of *Local FPD*. That is, the Wh-interrogative word taking matrix scope tend to be pronounced higher in pitch than that taking subordinate scope. The pitch track diagrams in (12) of the author's recordings illustrate this observation.

(12) a. *Global FPD:*

b. *Local FPD:*

In order to examine if this initial impression can be elevated to the level of generalization, I conducted a phonetic experiment involving the recordings by more substantial number of speakers. The experiment was conducted with the following procedure: (a) Seven test sentences involving Wh-interrogatives were prepared and quasi-randomized in order with 12 filler sentences — 4 different orders were prepared. (b) Ten Japanese speakers from Tokyo and its vicinity (Kanagawa and Chiba), ages 19~23, were asked to read aloud each sentence with natural intonation *after they read it silently and understand its interpretation*. (c) For potentially ambiguous Wh-questions, a preceding discourse and a specific answer were added to clarify the intended interpretation. (d) Eleven recordings per each sentence were obtained, of which ten renditions were adopted for analysis, with the first rendition discarded. (e) The peak  $F_0$  values of all the Wh-words in the recordings were measured. (f) *T-tests* were applied to the means of two independent samples in each pair of sentences.

The experiment was designed to examine whether or not Wh-expressions exhibit significant and consistent pitch differences under the following three distinct conditions: (i) "*scope asymmetry*" — when they are interpreted with *distinct scope* (matrix or subordinate), (ii) "*location asymmetry*" — when the "matrix scope taking" Wh-phrases

are *located in distinct clauses* (in the matrix clause or in the subordinate clause), and (iii) "*distance variation*" — when the *distance* between the Wh-expressions and their associated COMPs *varies* (short distance or long distance). Sections 3.2.1 - 3.2.3 below each presents the experimental results of (i)-(iii) and their analyses.

### 3.2.1 Scope asymmetry:

First, the effect of *scope asymmetry* on the pitch of Wh-expressions was examined. In this experiment, the two sentences in (13) below were used, which involve a direct Wh-question ((13a)) and an indirect Wh-question ((13b)), respectively.

- (13) a. [CP-M **DO'no** rikisi-ga katta-**no** ]? 'Which sumo wrestler won?'  
           which sumo.wrestler-NOM won-COMP<sub>Wh</sub>
- b. Q: [CP-M [CP-S **DO'no** rikisi-ga katta-**ka** ] kininarima'su-ka ]?  
           which sumo.wrestler-NOM won-COMP<sub>Wh</sub> wonder-COMP<sub>YN</sub>
- A: Ee, soodesune. Kanari kininattyai-masune.  
           yes right highly eager.to.know.

Are you eager to learn which sumo wrestler won while? Yes. Very much so.'

Crucially, the two Wh-interrogative sentences here have virtually identical content and length. Their only difference is whether the involved Wh-scope is matrix or subordinate. The pitch peak of a Wh-expression (henceforth *Wh-peak*) was compared between the two sentences.

The table in (14) summarizes the result of the *t*-test applied to the data obtained in this experiment, where the Wh-expression taking matrix scope is labeled as "Wh<sub>M</sub>" and that taking subordinate scope as "Wh<sub>S</sub>." In this table and all others that will be presented below, all indicated *p*-values are *two-tailed* and rounded to the nearest 1/1000. When *p*-values are smaller than 0.001, they are indicated with an inequality sign.

(14) T-test: Wh <sub>M</sub> > Wh <sub>S</sub>				
	df	t	p (2-tailed)	Δ peak (Hz: Wh <sub>M</sub> minus Wh <sub>S</sub> )
Speaker 1	18	<b>5.795</b>	> <b>0.001</b>	<b>48.40</b>
Speaker 2	18	<b>9.673</b>	> <b>0.001</b>	<b>21.77</b>
Speaker 3	18	<b>4.333</b>	> <b>0.001</b>	<b>14.01</b>
Speaker 4	18	<b>5.617</b>	> <b>0.001</b>	<b>60.13</b>
Speaker 5	18	<b>4.114</b>	<b>0.001</b>	<b>28.63</b>
Speaker 6	18	<b>3.340</b>	<b>0.004</b>	<b>9.32</b>
Speaker 7	18	<b>4.472</b>	> <b>0.001</b>	<b>18.17</b>
Speaker 8	18	<b>2.466</b>	<b>0.018</b>	<b>9.11</b>
Speaker 9	18	<b>5.352</b>	> <b>0.001</b>	<b>13.59</b>
Speaker 10	18	1.960	0.066	5.58

The result shows that nine out of ten speakers showed statistically significant

asymmetry of pitch peak between Wh<sub>M</sub> and Wh<sub>S</sub> — the former is higher than the latter (Wh<sub>M</sub> > Wh<sub>S</sub>).

### 3.2.2 Location asymmetry:

Second, the effect of *location asymmetry* on the pitch of Wh-expressions was examined. In this experiment, the two direct Wh-question sentences in (15) below were used, which involve a Wh-expression in the matrix clause ((15a)) and a Wh-expression in the subordinate clause ((15b)), respectively.

(15) < Food poisoning situation >

a. [<sub>M-CP</sub> kanzya-tati-wa sono mise-de NA'ni-o tabeta-*no* ]?  
 patients-TOP that restaurant-at what-ACC ate-COMP<sub>Wh</sub>  
 'What did the patients eat at that restaurant?'

b. [<sub>M-CP</sub> [<sub>S-CP</sub> kanzya-tati-wa sono mise-de NA'ni-o tabeta-to ] omoimasu-*ka* ]?  
 what-ACCate-COMP<sub>That</sub> think-COMP<sub>Wh</sub>  
 'What do you think the patients are at that restaurant?'

In both sentences, in other words, a Wh-expression takes matrix scope, while the location of these Wh-expressions is distinct. Again the Wh-peak was compared between the two sentences.

The table in (16) summarizes the result of the *t*-test in this experiment, where Wh<sub>M</sub> located in the matrix CP is labeled as "M-CP" and the Wh<sub>M</sub> located in the subordinate CP is labeled as "S-CP."

(16) T-test: M-CP vs. S-CP			
	df	t	p (2-tailed)
Speaker 1	18	0.333	0.743
Speaker 2	18	1.221	0.238
Speaker 3	18	0.341	0.737
Speaker 4	18	1.754	0.096
Speaker 5	18	1.943	0.068
Speaker 6	18	0.677	0.507
Speaker 7	18	1.365	0.189
Speaker 8	18	1.319	0.203
Speaker 9	18	0.221	0.827
Speaker 10	18	1.044	0.31

As the *p*-values here indicate, none of the ten speakers showed statistically significant asymmetry of Wh-peak between the Wh<sub>M</sub> in the matrix CP and the Wh<sub>M</sub> in the

subordinate CP in pitch (M-CP  $\approx$  S-CP).

### 3.2.3 Distance variation:

Third, the effect of *distance variation* on the pitch of Wh-expressions was examined. In this experiment, two Wh-questions were compared which differ from each other in the distance between the Wh-expression and its associated COMP. Such comparison was done between a pair of direct Wh-questions (Wh<sub>M</sub>) as in (17) as well as a pair of indirect Wh-questions (Wh<sub>S</sub>) as in (18). Again the Wh-peak was compared in each pair.

(17) a. [<sub>CP-M</sub> DO'no rikisi-ga katta-**no** ]? (= (13a))

which sumo.wrestler won-COMP<sub>Wh</sub>

'Which sumo wrestler won?'

b. [<sub>CP-M</sub> [<sub>CP-S</sub> DO'no rikisi-ga katta-to ] omoimasu-**ka** ]?

which sumo.wrestler won-COMP<sub>That</sub> wonder-COMP<sub>Wh</sub>

Speaker 10	18	0.480	0.637	Speaker 10	18	0.491	0.63

As the *p*-values here indicate, some speakers showed statistically significant sensitivity to the distance variation in determining the Wh-peak — it is higher when the distance between the Wh-expression and the associated COMP was longer (SD < LD). The contrast between (19a) and (19b) also reveals, however, that such a distance effect is quite erratic and varies both among speakers (Speakers 5, 7, 9 vs. Speakers 2, 3, 8) and sentences ((17) vs. (18)). We also observed above that (15a) and (15b) do not exhibit any significant contrast in Wh-peaks despite the distance variation involved there, as the experimental results in (16) indicated.

To sum up our experimental results, we did observe the following. First, the scope asymmetry of Wh-expressions clearly affects their Wh-peaks (Wh<sub>M</sub> > Wh<sub>S</sub>). Second, the location asymmetry of Wh-expressions does not affect their Wh-peaks (M-CP ≈ S-CP). Finally, variation in the distance between the Wh-expression and the associated COMP seems to affect Wh-peaks (SD < LD) but only erratically.

Among these results, what is worthy of our special attention is the scope asymmetry effect on Wh-peaks (Wh<sub>M</sub> > Wh<sub>S</sub>) we have observed in (13) above. Note especially that the scope asymmetry in Wh-peaks (Wh<sub>M</sub> > Wh<sub>S</sub>) in (13) arises *independently of* the Wh-COMP distance effect. I thus consider that my initial and informal observation on the asymmetrical prosodic prominence of the Wh-focus in *Global FPD* and *Local FPD* is verified. Another observation that I can report, though it is yet to be verified with a formal experiment, is that the asymmetry "Wh<sub>M</sub> > Wh<sub>S</sub>" is phonetically quite similar to the contrast between E-FPD and N-FPD reported on (2) and (1B) above.

The initial informal support for this observation comes when we compare the tables in (20) and (21).

(20)	Range of Wh <sub>M</sub> peak in (13a)	Range of Wh <sub>S</sub> peak in (13b)	Range of Δ peak (Wh <sub>M</sub> minus Wh <sub>S</sub> )
8 male speakers	132.8 ~ 259.5 (Hz)	119.2 ~ 199.4	5.58 ~ 60.13

(21)	E-FPD peak in (2)	N-FPD peak in (1B)	Δ peak (E-FPD minus N-FPD)
YK	225.63 (Hz)	194.17	31.46

The table (20) lists the pitch ranges of: (i) the Wh-peak of Wh<sub>M</sub> in (13a), (ii) the Wh-peak of Wh<sub>S</sub> in (13b), and (iii) their difference in the recordings of all the male speakers in our experiment above. The table (21) lists the average pitch peaks of: (i) E-FPD in (2), (ii) N-FPD in (1B), and (iii) their difference in the ten recordings by the author. Note that all the average peaks of E-FPD, N-FPD and their difference in (21) comfortably fall within the pitch ranges of Wh<sub>M</sub> peak, Wh<sub>S</sub> peak, and their difference in (20). This observation leads us to the hypothesis that the contrast between the focus prosody in Wh<sub>M</sub> and that in Wh<sub>S</sub> is essentially identical to the contrast between F-FPD and N-FPD.

#### 4. Semantics of Wh-focus:

Once such a hypothesis is adopted, we inevitably make a prediction that a Wh-expression taking matrix scope (continuing to be referred to as Wh<sub>M</sub>) is to be interpreted as exhaustive focus while that taking subordinate scope (Wh<sub>S</sub>) is to be interpreted as neutral focus, i.e., the focus which is not necessarily be interpreted as exhaustive while it also has a potential to be interpreted as exhaustive. This final section is devoted to argue for the plausibility of this hypothesis.

##### 4.1 Exhaustive and Neutral Wh-focus

First, Groenendijk and Stokhof (1981,157) claim that the proposition denoted by the complement CP in (22a) below must be exhaustive since the argument presented in (22) can be valid in English.

(22) a. John believes [<sub>CP</sub> that Bill and Suzy walk ].

b. Only Bill walks.

c. John doesn't know [<sub>CP</sub> who walks ].

While they mention only the exhaustiveness of the embedded proposition in (22a) here, their reasoning necessarily leads them to the view that the Wh<sub>S</sub> in (22c) must also be exhaustive.

The situation seems to be quite different, however, when we examine a similar argument in Japanese as in (23).

(23) a. John-wa [<sub>CP</sub> konya-no paatii-ni Mary-to Susan-ga yobareteiru-to ]

John-TOP tonight's party-to Mary-and Susan-NOM invited-that  
sinziteiru.

believe

'John believes that Mary and Susan have been invited to tonight's party.'

b. Mary-wa yobareta-kedo, Susan-wa yobare-nakatta.

Mary-TOP invited-though Susan-TOP was.not.invited

'Mary was but Susan wasn't invited.'

c. John-wa [<sub>CP</sub> konya-no paatii-ni DA're-ga yobareteiru-ka ] sir-anai.

John-TOP tonight's party-to who-NOM invited-COMP<sub>Wh</sub> know-not

'John doesn't know who has been invited to tonight's party.'

Here, the argument is deemed invalid. Japanese speakers feel rather clearly that John still has a partial knowledge of the identity of the invitees, and that it is too strong and inappropriate to simply claim that he does not know who have been invited to tonight's party. The Wh<sub>S</sub> in (23c), in other words, does not seem to have to be interpreted as exhaustive in Japanese.

We can confirm the validity of this intuition when we add a partitive expression *hitori-dake* 'one person only' to (23c), as in (24).

(24) John-wa [ konya-no paatii-ni DA're-ga yobareteiru-ka ] *hitori-dake* sitteiru.

John-TOP tonight's party-to who-NOM invited-COMP<sub>Wh</sub> 1.person-only know

'John knows the identity of only one of the people who have been invited to tonight's party.'

Since the partitive interpretation indicated by the translation is possible, the Wh<sub>S</sub> here must be interpretable as non-exhaustive.<sup>ii</sup>

Interestingly, on the hand, a similar Wh-question becomes incompatible with such a partitive interpretation when it takes matrix scope as in (25), which suggests the exhaustivity of the involved Wh-interrogative expression as focus.<sup>iii</sup>

(25) a. John-wa [ konya-no paatii-ni

John-TOP tonight's party-to

DA're-ga yobareteiru-koto ]-o *hitori-dake* sitteiru-no?

who-NOM invited-fact-ACC one.person-only know-COMP<sub>Wh</sub>

= 'Who does John alone know has been invited to tonight's party?' (Irrelevant)

≠ 'Who is the only one of the guests that John knows has been invited to tonight's party?'

b. DA're-ga *hitori-dake* yobareteiru-no?

who-NOM one.person-only invited-COMP<sub>Wh</sub>

= 'Who is the only one that has been invited to tonight's party?' (Irrelevant)

≠ 'Give me the identity of only one of the guests who have been invited to tonight's party.'

We observe here, in other words, that Wh<sub>M</sub> in general seems to be obligatorily interpreted as exhaustive focus while no such requirement seems to be imposed on Wh<sub>S</sub>. Putting together all the observations so far, we now reach a hypothesis that the prosody-information correlations in Tokyo Japanese Wh-interrogatives as follows. A matrix Wh-question, whether simplex or complex, is prosodically accompanied by *E*-FPD and semantically interpreted as *exhaustive* focus. A subordinate Wh-question, on the other hand, is accompanied by *N*-FPD and interpreted as *neutral* focus.

This hypothesis can be further supported when we analyze a paradigm as in (26).

(26) a. [<sub>CP</sub> DA're-ga *sankasuru-ka*] *daitai* wakatteimasu.

who-NOM participate-COMP<sub>Wh</sub> mostly know

'We mostly know who will participate.'

= 'We know the identity of *most of whom* that will participate.'

b. DA're-ga *daitai* sankasimasu-ka?

who-NOM mostly participate-COMP<sub>Wh</sub>

= 'Who will participate in most events?' (Irrelevant)

≠ '*Most of whom* will participate?'

c. *Sannensee-wa* *daitai* sankasimasu.

3rd.grader-TOP mostly participate

= '*Most of the third graders* will participate.'

What we observe in (26a) reminds us of the Quantificational Variability Effects (QVE) discussed in the semantics literature like Berman (1991), Lahiri (2002), and Beck and Sharvit (2002), in which an adverb of quantification in the matrix clause appears to quantify over answers to the embedded question (or subquestions). Since the adverb in question is a partitive expression *daitai* 'mostly', this amounts to the observation that the subordinate Wh-interrogative in (26a) and its answer need not be interpreted as inducing

exhaustive focus. A crucial new observation we can add here is that a similar interpretive effect is not available when the involved Wh-interrogative takes matrix scope as in (26b). We witness here, in other words, the matrix-subordinate asymmetries of QVE between Wh<sub>S</sub> and Wh<sub>M</sub>. We can confirm that the interpretive asymmetry in question is induced by Wh-interrogation when we eliminate a Wh-interrogative expression from (26b) as in (26c) and see that the partitive interpretation is permitted. Both "subordinate-matrix" asymmetry and "Wh-NonWh" asymmetry here can be correctly captured when we assume that the "Wh<sub>M</sub>-focus" is obligatorily exhaustive while "Wh<sub>S</sub>-focus" is not, and only the former is incompatible with the partitive adverbial expression. Note also that partitivity is compatible with (26b) when it does not restrict the Wh-focus, which provides the interpretation irrelevant to our investigation.

The neutrality of "Wh<sub>S</sub>-focus" can be also demonstrated when we see that it is compatible either with a partitive expression *hitori-dake* 'one person only' as in (27a) or with an exhaustive expression *hitori-nokorazu* 'without leaving anyone out' as in (27b).<sup>iv</sup>

- (27) a. [<sub>CP</sub> reesu-ni DA're-ga sankasuru-ka ]     *hitori-dake* wakatteimasu.  
           race-in who-NOM participate-COMP<sub>Wh</sub> one-only     known  
           'We know of only one of the people who are participating in the race.'
- b. [<sub>CP</sub> reesu-ni DA're-ga sankasuru-ka ]     *hitori-nokorazu* osiete-kudasai.  
           race-in who-NOM participate-COMP<sub>Wh</sub> all.of.them     tell.us  
           'Please inform us of everyone that will participate in the race.'

#### 4.2 Potential Counterexamples and Restricted Exhaustivity:

There are some sentences which strike us as counterexamples to our hypothesis above.<sup>v</sup> First, the acceptability of the sentence in (28) below provides us with the impression that Wh<sub>M</sub> need not be interpreted as exhaustive focus.

- (28) *Tatoeba*,     DA're-ga sankasimasu-ka?  
           for.instance who-NOM participate-COMP<sub>Wh</sub>  
           'For instance, who will participate?'

Here, the interpretation of *tatoeba* 'for instance' apparently involves partitivity, and hence is expected to be incompatible with the exhaustivity of Wh<sub>M</sub>, contrary to the fact.

I believe, however, that the problem here is only apparent. Observe first a matrix Wh-question as in (29), which is accompanied by a topic phrase.

- (29) *Sannensee-wa* DA're-ga sankasimasu-ka?  
           3rd.grader-TOP who-NOM participate-COMP<sub>Wh</sub>  
           'Among the third-graders, who will participate?'

Here, the topic phrase *sannensee-wa* 'third grader-TOP' indicates a temporary pragmatic restriction imposed by the addresser, and the Wh-question requests the exhaustive answer within this restriction — "limiting ourselves to the third graders, please provide an exhaustive list of the people who will participate." The answer here therefore need not provide the exhaustive list of participants in the strictest sense, which may include, for instance, second-graders. *Dare* 'who' in (29) therefore can be regarded as a Wh<sub>M</sub>-focus inducing *restricted exhaustivity*. In fact, using the Wh-question in (29), we can make a paradigm similar to (26) above which exhibits both "subordinate-matrix" asymmetry and "Wh-NonWh" asymmetry:

- (30) a. [<sub>CP</sub> *Sannensee-wa* DA're-ga *sankasuru-ka*] *daitai* wakatteimasu.  
 3rd.grader-TOP who-NOM participate-COMP<sub>Wh</sub> mostly know  
 = 'We know the identity of most of the third-graders that will participate.'
- b. *Sannensee-wa* DA're-ga *daitai* *sankasuru-no*?  
 3rd.grader-TOP who-NOM mostly participate-COMP<sub>Wh</sub>  
 = 'Who among the third-graders will participate *in most events*? (Irrelevant)  
 ≠ 'Give me the identity of *most of the third-graders that will participate*.'
- c. *Sannensee-wa* *dansi-ga* *daitai* sankasimasu.  
 3rd.grader-TOP boys-NOM mostly participate  
 = 'Among the third graders, *most of the boys* will participate.'

Here, the Wh-question in (29) becomes compatible with a partitive expression *daitai* 'mostly' when it is embedded as in (30a) while it is still incompatible in the matrix as in (30b). No such restriction is observed, on the other hand, even in the matrix clause when the Wh-expression is eliminated as in (30c). We can confirm, in other words, that the Wh<sub>M</sub> in (29) involves exhaustive focus, though this focus is of a "restricted" kind.

Returning now to (28), I would like to point out that this sentence can be analyzed in a similar way as in (29). The expression *tatoeba* 'for instance' represents the *restricted* domain of *exhaustivity* imposed by the addresser — "Limiting yourself to a small portion of the entire participants, please provide the list of those participants." Here as well, exhaustivity is imposed but only on the restricted small number *of the addressee's choice*. Once again, we can confirm that the Wh-expression in (28) induces exhaustive focus when we observe a "subordinate-matrix" asymmetry as in (31) below concerning its compatibility with a partitive expression *hitori* 'one person'.

- (31) a. [<sub>CP</sub> *Tatoeba*, DA're-ga *sankasuru-ka*] *hitori* agetemite-kudasai.  
 for.instance who-NOM participate-COMP<sub>Wh</sub> one.person mention  
 'Please mention one of the people, for instance, who are participating.'

- b. *Tatoeba*, DA're-ga *hitori* sankasimasu-ka?  
 for.instance who-NOM one.person participate-COMP<sub>Wh</sub>  
 ≠ 'For instance, who is one of those who participate?'

*Dare* 'who' as Wh<sub>S</sub> in (31a) induces neutral focus and is compatible with *hitori*, while *dare* as Wh<sub>M</sub> in (31b) induces "restricted exhaustive focus," and is incompatible with *hitori*.

Another potential problem arises when we observe that the Wh<sub>M</sub> in (32A) below seems to permit a partitive interpretation since it can be answered as in (32B), which obviously does not provide the exhaustive list of the possible answers.

- (32) A: JR-no zikokuhyoo-wa DO'ko-de kaemasu-ka?  
 JR-GEN schedule-TOP where-at available  
 'Where can we buy a (train) schedule for Japan Railways?'  
 B: Soko-no eki-mae-no honyasan-de kaemasuyo.  
 right.there station.front book.store-at available  
 'You can buy it at the bookstore in front of the station right there.'

We may consider, however, that (32) also induces restricted exhaustivity, assuming that the question here involves a *tacit pragmatic restriction* equivalent to *kono-hen-dewa* 'around here' as in (33).

- (33) (Kono-hen-de-wa) JR-no zikokuhyoo-wa DO'ko-de kaemasu-ka?  
 here.around-TOP JR-GEN schedule.book-TOP where-at available-COMP<sub>Wh</sub>  
 'Where can I buy JR's (train) schedule book (around here)?'

Once again, a partitive expression *ikkasyo-dake* 'only one location' is incompatible with the restricted exhaustiveness of the Wh<sub>M</sub>-focus *doko* 'where' in this sentence, as shown in (34a).

- (34) a. (Kono-hen-de-wa) JR-no zikokuhyoo-wa DO'ko-de *ikkasyo-dake* kaemasu-ka?  
 = '??What is the location around here where JR's schedule book is exclusively purchasable.' (Irrelevant)  
 ≠ 'Please show me only one of the locations you know around here where we can buy JR's schedule book.'  
 b. [<sub>CP</sub> (Kono-hen-dewa) JR-no zikokuhyoo-ga DO'ko-de kaeru-ka ]  
 around.here JR-GEN schedule.book-NOM where-at available-COMP<sub>Wh</sub>  
*ikkasyo-dake*-demo wakareba suguni kaniik-aseru-nodaga.  
 even.one.place if.known right.away send.someone.to.buy-though  
 'If even one place were known where we can buy JR's schedule book, I would send someone there to buy one!'

When we embed the Wh-question in (33) as in (34b), on the other hand, it can be restricted by the same partitive expression without any problem.

Finally, when we alter the word order in (26b) as in (35) below, the partitive expression *daitai* seems to become compatible with Wh<sub>M</sub>.

- (35) *Daitai*,            DA're-ga sankasimasu-ka?  
 approximately who-NOM participate-COMP<sub>Wh</sub>  
 = 'Roughly speaking, who do you expect to participate?'  
 ≠ 'Please tell me the identity of *most of whom will participate*.'

It seems to be the case, however, that *daitai* here does not indicate the partitivity of Wh-focus but is associated with the utterances a whole and means something like "roughly speaking." In this sense, we may consider that *daitai* 'approximately' here is inducing restricted exhaustiveness. In fact, when a partitive expression cannot fulfill such a "speech-act-like" function, no similar reordering effect arises:

- (36) *Hitori-dake*        DA're-ga sankasimasu-ka?  
 one.person-only who-NOM participate-COMP<sub>Wh</sub>  
 = 'Who is the lone participant?' (Irrelevant)  
 ≠ 'Please tell me the identity of *only one of whom will participate*.'

## 5. Conclusions and Possible Syntactic Analyses

In this paper, I have argued for the existence of prosody-information correlations in Tokyo Japanese for focus in general and then for Wh-focus in particular. First, the general correlation between extraordinary focus prosody and *exhaustive* focus interpretation was pointed out. It was further argued that this correlation obligatorily holds for a matrix Wh-question but not for a subordinate Wh-question, the latter of which is accompanied by a more neutral type of focus prosody and is interpreted as a focus that is *neutral* as to its exhaustivity. Descriptively speaking, we have pointed out that obligatory exhaustivity is a matrix phenomenon of Wh-focus.

If this generalization is correct, we must not only identify a syntactic locus of exhaustivity that is available in every Wh-question but also make its appearance in its matrix clause obligatory. This task may be achieved with the following analysis, though its full development must be left for future work. First, we assume that the exhaustive focus operator feature ( $Ex_F$ ) is lexically introduced to the head of the domain of an exhaustive focus interpretation, and comes to be associated with the focus item in this domain at LF, as indicated in (37).<sup>vi</sup>

- (37) [CP [IP Kyoo-wa **ME'arii<sub>F</sub>-ga** kimasita ]  $\emptyset_{\text{COMP-EX}_F}$ ] (= (2))  
 today-TOP Mary-NOM came 'No one else but **MARY** came today.'

We then capture the obligatory appearance of  $EX_F$  in matrix Wh-questions by postulating a *performative* interrogative predicate  $\emptyset_{ASK}$  in the matrix context as in (38a) below, and assuming that it has a selectional property "+[ $EX_F$ ]."

- (38) [CP [IP **DA're<sub>F</sub>-ga** sankasimasu ] **ka-EX<sub>F</sub>**] ]  $\emptyset_{ASK}$ ? 'Who will participate?'  
 who-NOM participate COMP<sub>Wh</sub> +[ $EX_F$ ]

The contrast in (39) below provides initial support to this analysis.

- (39) a. [CP DA're-ga sankasuru-ka ] **hitori-dake** **sittei**-masu.  
 who-NOM participate-COMP<sub>Wh</sub> one-only know  
 'I know the identity of only one of the people who will participate.'  
 b. [CP DA're-ga sankasuru-ka ] **hitori-dake** **tazune**-masita.  
 who-NOM participate-COMP<sub>Wh</sub> one-only asked  
 = 'I alone asked who will participate.'  
 ≠ 'I asked the identity of only one of the people who will participate.'

While the partitive interpretation of *hitori-dake* 'one person only' is compatible with  $Wh_S$  when this clause is selected by the matrix predicate *sittei* 'know' as in (39a), it becomes unavailable when  $Wh_S$  is selected by *tazune* 'ask' as in (39b). Under the proposed analysis, the interpretive restriction in (39b) can be reduced to a similar restriction involving  $Wh_M$  as in (38) since (39b) also involves a higher predicate selecting an interrogative COMP accompanied by the feature  $EX_F$ , as illustrated in (40).

- (40) [CP [IP DA're<sub>F</sub>-ga sankasuru ] **ka-EX<sub>F</sub>**] **hitori-dake** **tazunemasita**.  
 one.person asked (+[ $EX_F$ ])

Extending the syntactic structure of the clause periphery a little further, we may also be able to consider that "restricted exhaustivity" discussed in 4.2 above is induced when partitive expressions (e.g., *tatoeba* 'for instance' in (28) and *daitai* 'roughly speaking' in (35)) are placed within a Topic phrase located outside the scope of the speech act QUEST and become topical just as *sannensee-wa* 'third graders-TOP' in (29) is, as illustrated in (41). (cf. Krifka (2001) and Kitagawa, et al. (2004))

- (41) [TOP P **Tatoeba** TOP ] [[QUEST] [ **DA're<sub>F</sub>-ga** sankasimasu-**ka-EX<sub>F</sub>** ]  $\emptyset_{ASK}$  ]?  
 for.instance who-NOM participate-COMP<sub>Wh</sub>

'For instance, who will participate?'

Evidently, more substantial investigation is necessary to support these syntactic analyses more fully.

## Notes

\* I am grateful to Shinichiro Ishihara, Chris Tancredi, Kenji Yoshida, and especially Satoshi Tomioka for their insightful comments, examples, advice and/or assistance. The usual disclaimers apply. This paper is based upon work supported by the National Science Foundation under Grant No. BCS-0650415.

<sup>i</sup> Kitagawa (2008) provides examples which demonstrate that an informative item ([+Info]) and a non-informative item ([-Info]) can be distinguished even within a *discoursary all-new phrase*, as a *discourse-given* item in a *topic* phrase, and even when a clear *focus* exists *elsewhere* in the same utterance.

<sup>ii</sup> When we place the partitive *hitori-dake* 'one person only' within the subordinate clause, an interesting asymmetry arises depending on its position as in (i) and (ii).

(i) John-wa [ konya-no paatii-ni *hitori-dake* DA're-ga yobareteiru-ka ] sitteiru.

(ii) John-wa [ konya-no paatii-ni DA're-ga *hitori-dake* yobareteiru-ka ] sitteiru.

(i) seems to permit the interpretation indicated in (24) in addition to the irrelevant interpretation 'John knows the identity of the only one person that has been invited to tonight's party,' while (ii) does not. I leave this as an unsolved mystery. Possibly, *hitori-dake* and the adjunct PP preceding it each has been moved to the matrix.

<sup>iii</sup> The interpretive asymmetry mentioned in footnote ii does not arise even when we place the partitive *hitori-dake* in the subordinate clause here:

(i) John-wa [ konya-no paatii-ni *hitori-dake* DA're-ga yobareteiru-koto ]-o sitteiru-*no*?

(ii) John-wa [ konya-no paatii-ni DA're-ga *hitori-dake* yobareteiru-koto ]-o sitteiru-*no*?

Both of (i) and (ii) also reject the partitive interpretation rejected in (25a), further demonstrating the asymmetry between Wh<sub>M</sub> and Wh<sub>S</sub>.

<sup>iv</sup> We should therefore consider that the correlation between *E-FPD* and exhaustive focus is unidirectional (*E-FPD* → exhaustive focus), not bidirectional.

<sup>v</sup> I am grateful to Satoshi Tomioka and Chris Tancredi for bringing up and discussing the potential counterexamples in this section.

<sup>vi</sup> I tentatively introduce *Ex<sub>F</sub>* under COMP without making a commitment to this particular choice.

# A Puzzle of Contrastive *Wa* in Japanese\*

Yukio Furukawa

McGill University  
1085 Dr. Penfield, Montreal, QC, H3A1A7, Canada  
yfurukawa@tokai.or.jp

## Abstract

Contrary to the disambiguation in the German contrastive topic construction, the contrastive *wa*-particle in Japanese apparently makes an unambiguous sentence ambiguous: its association with a universal *subete-no*-NP can shift its scope under negation. This paper shows, however, that the wide scope negation by its association is apparent, and no scope shifting takes place in the sentence. In addition, a puzzle arises if the semantics of a sentence with *wa* is computed: contrary to our intuition, its ordinary semantic value cannot derive the apparent wide scope negation as long as the associated *subete-no*-NP is postulated as a universal quantifier. To resolve the conflict, this paper proposes that the associated *subete-no*-NP is not a universal quantifier but denotes the name of a particular individual. According to the study on plurality, an NP can denote a structured set that contains both atomic and plural individuals. If the associated *subete-no*-NP denotes the name of the maximal individual in the set, the ordinary semantic value of a sentence with *wa* does not contradict the apparent wide scope negation.

**Keywords:** *wa*, alternative semantics, contrastive topic construction, scope, plurality.

## 1. Introduction: contrastive *wa*

Japanese has a rich system of focus morphology: association of focus particles such as *mo*, *dake*, *sae*, and so on triggers effects that are similar to the focus effects displayed by ‘also’, ‘only’, ‘even’, etc. Among them, this paper focuses its attention on *wa*. It is widely assumed that associating the *wa*-particle can induce contrast (see Kuno 1973; Kuroda 2005; among others). Consider the sentences in (1). Both (1b) and (1c) are supposed to be answers to the question (1a). In (1b), the speaker asserts that s/he

---

\* Materials discussed in this paper were partly presented at ELSJ (the English Linguistic Society of Japan) International Spring Forum 2008, held at Tokyo University of Foreign Studies in April 2008. Any remaining errors belong to me.

knows that John came, and, at the same time, s/he can implicate, for example, that s/he does not know about other potential attendees. On the other hand, the utterance (1c) can be a complete answer that carries no implicature.

### 1.1. Apparent scope inversion by contrastive *wa*

One of the peculiarities of contrastive *wa* is that it is apparently involved in scope phenomena. Consider the sentences in (2) that have *subete-no*-NP and negation in the same clause.<sup>2</sup> Many previous studies of Japanese assume that *subete* corresponds to ‘all,’ though I later reject this assumption. It is reported that, in Japanese, negation tends to take wider scope than *subete* in the same clause (see Kuno 1980; cf. Miyagawa 2001; Yatabe 1995). I assume that (2) only means the narrow scope negation with respect to the universal *subete-no*-NP: it is not true in the situation in (3b), but is true in (3a). Given this, its meaning description seems closer to (4a) than (4b).

- (2) John-ga *subete-no-gakusei-ni* LGB-o

- (3) a. John has exactly four students. John let none of them read LGB.  
 b. John has exactly four students. John let only two of them read LGB.

<sup>1</sup> See Footnote 3.

<sup>2</sup> It is often assumed that *nai* is (truth functional) negation  $\neg$  in Modern Japanese. To avoid any confusion by readers, this paper adopts this assumption. However, the assumption seems unwarranted, and, in fact, I refute it in Furukawa (2008).

- (4) a. all > ¬ “for all students, John did not let them read LGB.”  
 b. ¬ > all “It is not the case that, for all students, John let them read LGB.”

    yom-ase-ta]-no-de-**wa**                    *nai*.  
    read-CAUSE-PAST]-NML-CPL-FOC    NEG

To express a reading similar to wide scope negation (4b), Japanese associates the contrastive *wa*-particle<sup>4</sup> either directly with *subete-no*-NP as shown in (5a) (see Hara to appear; Nakanishi 2007), or with the final position of the sentence excluding negation, though its association in the latter case has *no-de* intervening, as shown in (5b).<sup>5</sup>

<sup>3</sup> Since the following discussions are based on focus semantics, the contrastive *wa*-particle in the following examples is glossed as FOC ‘focus’, though some previous studies gloss it as (C)TOP ‘(contrastive) topic’, as shown in (1b) (see Hara to appear; Nakanishi 2007).

<sup>4</sup> Those who are familiar with the previous studies of *wa*-particle might raise the following question. It is often assumed (see Kuno 1973; Nakanishi 2007; cf. Kuroda 2005) that *wa* is (apparently) ambiguous between contrastive and non-contrastive/‘topic’ aspects. Here, I have to show that *wa* in (5) is really contrastive. To verify whether or not their *was* are really contrastive, Kuroda (2005) proposes one diagnostic: if a sentence with *wa* is embedded in a conditional such as *mosi...ta/na-ra*, only its contrastive reading emerges. This seems to be the case, as shown in (i). Note, however, that, to avoid any complication, and also, to focus our attention on the scope relation between *subete-no*-NP and negation, the examples in this paper ignore *mosi...ta/na-ra*. Note that Nakanishi (2007) also provides a phonological diagnostic to distinguish them. She reports that the contour of a sentence with contrastive *wa* significantly differs from that of a sentence with non-contrastive *wa*.

- (i) (mosi) John-ga        *subete-no-gakusei-ni-wa*        LGB-o

       yom-ase-*nakat-ta(-ra)*...  
       read-CAUSE-NEG-PAST(-COND)

<sup>5</sup> One might wonder whether or not the scope phenomenon here is inherent to the subject of the caused event in Japanese. As far as I can see, it is observable in several places in Japanese. In (i), *subete-no*-NP occupies the object position of the embedded clause. Since it is true in (iia) but false in (iib), it seems to unambiguously mean narrow scope negation (iia). Once its *subete-no*-NP is contrasted by *wa*, the wide scope

Here, I have three things to note. First, Section 1.2 suggests that the wide scope negation intended in (5) requires ‘relevant’ alternatives: unless the discourse designates such alternatives, (5) still means narrow scope negation. Second, scope relation in German is also affected by contrast, and some previous studies on contrastive *wa* try to assimilate the apparent scope shifting induced by contrastive *wa* with the German scope phenomenon. Section 1.3 insists, however, that the former basically differs from the latter. Finally, one might think that wide scope negation is available in (5) since *wa* can shift the scope of the associated quantifier under the scope of negation. However, Section 1.4 shows that the wide scope negation intended in (5) is apparent since *wa* does not shift the scope of the associated quantifier.

### 1.2. Relevant alternatives

It is not necessary that (5) unambiguously express wide scope negation. In fact, the association of *wa* with *subete-no-NP* seems to make the unambiguous sentence ambiguous: (5) seems to have both narrow and wide scope negation.

In addition, narrow and wide scope negation in (5) are highly context dependent. As generally required by sentences with focus, both (5a) and (5b) require sets of

---

negation (iiib) emerges in (iv). Note that the following discussions do not consider the contrast between (i) and (iv): comparison between them seems unfair due to the presence/absence of the Accusative Case marking.

 read-CAUSE-PAST]-NML-CPL-FOC NEG

‘relevant’ alternative propositions that may be contextually determined,<sup>6</sup> and the wide scope negation intended by them depends on the design of the sets. For example, if discourse designs a set of alternatives as in (6a), (5a) is false in the situation (3a) but true in (3b).<sup>7</sup> On the other hand, if discourse designs a set of alternatives as (6b), it can be true in (3a). These seem to suggest that its wide scope negation is intended merely as an implicature.

- (6) a. {for all 1st year students John let them read LGB, for all 2nd year students John let them read LGB, for all 1st and 2nd year students John let them read LGB...}  
 b. {for all professors John let them read LGB, for all postdocs John let them read LGB, for all TAs John let them read LGB...}

### 1.3. German contrastive topic differs from contrastive *wa*.

German has a similar scope phenomenon to the apparent scope shifting by contrastive *wa*. In fact, some previous studies try to assimilate it with the German scope phenomenon (see Hara to appear; Nakanishi 2007). The following presents an outline of the German contrastive topic construction.

It is reported that, with unmarked stress, the universal quantifier *alle* ‘all’ can take both wider and narrower scope than negation *nicht* (see (7a)). Once its universal quantifier has contrastive contour, only the narrower scope reading of *alle* is available, as shown in (7b) (see Büring 1997; Krifka 1998; among others).<sup>8</sup>

- (7) a. Alle Politiker sind nicht korrupt.  
 all politicians are not corrupt  
 $\sqrt{\forall} > \neg$  “For all politicians, it is not the case that they are corrupt.”  
 $\sqrt{\neg} > \forall$  “It is not the case that all politicians are corrupt.”

<sup>6</sup> Contrary to (5), (2) doesn’t require a set of alternatives. In fact, recent studies on *wa* assume this, and provide analyses based on focus semantics (see Section 2).

<sup>7</sup> Since how to design a set of relevant alternatives for the intended wide scope negation is part of the puzzle that is mentioned later, I do not mention it until Section 4.

<sup>8</sup> Previous studies on the construction report that the contrasted *alle* in (7b) has a rise contour. They assume that the rise contour is a topic contour in German. They further report that, at the same time, (7b) has a fall contour on *nicht*. Some of the studies assume that its fall contour is a focus contour in German. For further details on the construction, see Büring (1997), Krifka (1998), and among others.

- b. )ALLE Politiker sind NICHT\ korrupt.  
 $*\forall > \neg, \sqrt{\neg} > \forall$  (Büring 1997; see also Krifka 1998; Nakanishi 2007)

Although previous studies on German give several analyses to the disambiguation in (7b), I do not discuss details of these analyses here since the main issue of this paper is independent of the issues of the German contrastive topic construction. Nevertheless, I would like to insist here that what is going on in the apparent scope shifting by contrastive *wa* seems completely different from the disambiguation in the German contrastive topic construction: while the latter decreases the number of its possible readings as exemplified in (7), the former seems to increase the number of possible readings, as observed earlier. Therefore, I believe that the former should not be analyzed exactly in the same way as the latter.

#### 1.4. No scope shifting takes place.

Given the availability of wide scope negation, one might think that, since *wa* can shift the scope of its associated quantifier under the scope of negation, (5) is ambiguous. I insist, however, that no scope shifting takes place in (5). Consider the sentences in (8) that contain a disjunction phrase and negation.

- (8) a. John-ga [Bill ka Mary]-ni LGB-o  
 John-NOM [Bill or Mary]-DAT LGB-ACC  
 yom-ase-nakat-ta (koto)  
 read-CAUSE-NEG-PAST (fact)
- b. John-ga [Bill ka Mary]-ni-**wa** LGB-o  
 John-NOM [Bill or Mary]-DAT-FOC LGB-ACC  
 yom-ase-nakat-ta (koto)  
 read-CAUSE-NEG-PAST (fact)
- c. [John-ga [Bill ka Mary]-ni LGB-o  
 [John-NOM [Bill or Mary]-DAT LGB-ACC  
 yom-ase-ta]-no-de-**wa** nai.  
 read-CAUSE-PAST]-NML-COL-FOC NEG

As shown in the truth table in (10), it is reported e.g. by Goro (2003) that (8a) never has wide scope negation.<sup>9</sup> If the disjunction phrase is contrasted by *wa*,

<sup>9</sup> It seems to me that (8a) can be true in the situation where both (9a) and (9b) are

however, the scope of disjunction is still higher than negation in (8b), as indicated in the table in (10).

- (9) a. John let Bill read LGB.  
b. John let Mary read LGB.

(10)

	true in (9a) & true in (9b)	true in (9a) & false in (9b)	false in (9a) & true in (9b)	false in (9a) & false in (9b)
(8a)	false	true	true	#
(8b)	false	true	true	true
(8c)	true	false	false	true

This seems to suggest that *wa* has no ability to shift the scope of the associated quantifier, and hence, the intended wide scope negation in (5) is apparent.<sup>10</sup> Given this, Section 4 claims that a different meaning description gives (5) the impression that its intended meaning is wide scope negation.

---

false. Nevertheless, however, it seems infelicitous in this situation, as indicated in the truth table (10). Its infelicity seems to be partly due to the preference of ‘stronger’ statements such as the utterances in (i).

- (i) a. John-ga [Bill-to-Mary]-ni LGB-o  
John-NOM [Bill-and-Mary]-DAT LGB-ACC  
yom-ase-nakat-ta (koto)  
read-CAUSE-NEG-PAST (fact)
- b. John-ga [Bill-ni-mo Mary-ni-mo] LGB-o  
John-NOM [Bill-DAT-also Mary-DAT-also] LGB-ACC  
yom-ase-nakat-ta (koto)  
read-CAUSE-NEG-PAST (fact)

“(the fact that) as for Bill and Mary, John did not let them read LGB.”

<sup>10</sup> Bernhard Schwarz (p.c.) points out to me that (8) does not necessarily show that *wa* does not shift the scope of the associated *subete-no*-NP in (5) if the wide scope disjunction in (8a) and (8b) is due to the idiosyncratic nature of *ka* (the disjunction marker in Japanese), such as bearing positive polarity. In fact, Goro (2003) provides an analysis in this line. Although I have objections to Goro’s claim, I postpone my objections to another occasion due to space limitations.

## 2. Semantics of Focus

As mentioned in Section 1.3, recent studies agree that the meaning of a sentence with contrastive *wa* requires (a set of) alternative propositions. Given this, these studies basically follow alternative semantics that crucially uses a set of alternative propositions to compute the meaning of a sentence with focus (though some of the studies do not consider contrastive *wa* to be a focus-particle but instead a topic-particle). The following presents the essential parts of alternative semantics.

Despite a long debate, previous studies on the semantics of focus basically agree on the two conditions listed in (11). The alternative semantics that was largely developed by Rooth (1985; 1996) nicely incorporates them into the semantic description of a sentence with focus, as defined in (12).

- (11) a. Association of focus does not change the truth value.  
b. Focus introduces a set of alternatives. (Rooth 1996)

- (12) *alternative semantics*: the meaning of focus consists of...  
a. an ordinary semantic value of the proposition and  
b. a set of its alternative propositions. (Rooth 1996)

An ordinary semantic value and the alternative propositions are defined based on the guideline in (13). Given (12) and (13), the semantics of the sentence (14a) can be defined as (14b-c).

- (13) a. The ordinary semantic value of a sentence with focus is identical to the semantic value of its focus-less counterpart.  
b. An alternative proposition is obtained by making substitutions in the position of the focused phrase.

- (14) a. John introduced Bill to [Sue]<sup>F</sup>  
b. ordinary semantic value: the semantic value of “John introduced Bill to Sue”  
c. set of alternatives: the set of propositions of the form “John introduced Bill to *z*” (see Rooth 1996)

Since I also assume that the meaning of a sentence with contrastive *wa* requires (a set of) relevant alternatives, I adopt these basics of alternative semantics. When

alternative semantics is applied to (5a), however, one problem arises.

### 3. The puzzle

Consider (5a), repeated in (15a).<sup>11</sup> As mentioned earlier, we definitely have an intuition that the utterance (15a) can be true in the situation (3b), repeated in (15c).

- (15) a. John-ga            *subete-no-gakusei-ni-wa*    LGB-o  
           John-NOM    all-GEN-student-DAT-FOC   LGB-ACC  
           *yom-ase-nakat-ta*                    (koto)  
           read-CAUSE-NEG-PAST    (fact)
- b. John has exactly four students. John let none of them read LGB.  
 c. John has exactly four students. John let only two of them read LGB.

Based on alternative semantics, let us define the ordinary semantic value of (15a). If its ordinary semantic value is the same as the value of (4a), repeated in (16a), the intended wide scope negation in (15a) is not obtainable since, contrary to our intention, (15a) would be false in (15c). The wide scope negation is not obtainable either if its ordinary semantic value is the same as the value of (16b) that considers the case where *nai* in (15a) somehow does not work as truth functional negation but as a kind of pragmatic negation, such as meta-linguistic negation.<sup>12</sup>

- (16) a. “for all students, John did not let them read LGB.”                    (all>¬)  
       b. “for all students, John let them read LGB.”  
       c. “It is not the case that, for all students, John let them read LGB.”    (¬>all)

<sup>11</sup> As for (5b), see Footnote 12.

<sup>12</sup> Contrary to truth functional negation, Horn (1989) reports that it is not necessary that meta-linguistic negation changes the truth value of a proposition. I suspect that Japanese also has meta-linguistic negation (see also Horn 1989). A piece of evidence for it is the truth of (8c) in the situation where John let both Bill and Mary read LGB, as observed in the truth table (10). Its truth in the situation suggests that the truth of its nonnegative counterpart (i) is not falsified by the presence of negation in (8c). Note that there is little understood not only about meta-linguistic negation in Japanese but also about meta-linguistic negation in general. Hence, this paper avoids discussing the semantic value of (5b) since it may involve such pragmatic factors.

(i) John-ga    [*Bill ka Mary*]-ni    LGB-o    *yom-ase-ta*                    (koto)  
       John-NOM [Bill or Mary]-DAT LGB-ACC read-CAUSE-PAST    (fact)  
       “(the fact that) John let Bill or Mary read LGB.”

On the other hand, if the ordinary semantic value of (15a) is the same as the value of (4b), repeated in (16c), its truth in (15c) is apparently predicted. Nevertheless, however, several problems arise. First, as mentioned earlier, it is assumed in (11a) that focus does not change the truth value, and hence, the ordinary semantic value of (15a) should be identical to the semantic value of the sentence without focus. However, its focus-less counterpart (2), repeated in (17), never exhibits the wide scope reading of negation.

(17) John-ga     *subete-no-gakusei-ni*     LGB-o  
        John-NOM all-GEN-student-DAT     LGB-ACC  
        *yom-ase-nakat-ta*                     (koto)  
        read-CAUSE-NEG-PAST (fact)

In addition, as observed earlier, *wa* does not shift the scope of the associated quantifier. Finally, previous subsections discuss that the intended wide scope negation (16c) seems to be merely an implicature. If this is correct, the ordinary semantic value of (15a) should not be identical to the value of (16c) since, logically speaking, implicatures should be distinct from what is conveyed (or entailed).

Thus, (15a) seems to have no ordinary semantic value that can be true in the situation (15c). Nevertheless, native speakers of Japanese have an intuition that (15a) can be true in (15c), as observed earlier. This is the puzzle behind (15a).

#### 4. My solution

Suppose that the status of *nai* does not differ in (17) and (15a). As long as *subete-no-NP* were postulated to be a universal quantifier, the three candidates mentioned in (16), i.e.  $\forall\neg\alpha$ ,  $\forall\alpha$ , and  $\neg\forall\alpha$ , would exhaust the logical possibilities for the scope relations between *nai* and *subete-no-NP*. As observed in Section 3, however, none of them is able to predict the truth of (15a) in the situation (15c). The puzzle seems to suggest that no analysis that assumes that *subete-no-gakusei* in (15a) is a universal quantifier corresponding to ‘all students’ can solve the puzzle. Thus, I give up the assumption.

Alternatively, I propose that its *subete-no-gakusei* denotes the name of a particular (plural) individual. Given that, the ordinary semantic value of (15a) can be described as (18).

(18)  $[[\text{let}]](j)(p) = 0$   
 where  $p = \text{read}(\textit{subete-no-gakusei}, \textit{lgb})$

What kind of an individual can it denote? Recent studies on plurality propose that the set denoted by an NP can be a structured set (see Link 1983). Suppose, for example, that the current world has exactly four students, namely Bill, Carl, Mary and Sue. According to the studies, the set denoted by *gakusei* ‘student’ in this world can be defined as in (19), containing not only atomic members such as Bill but also plural members such as Bill+Mary.

(19)  $\{B(\text{ill}), C(\text{arl}), M(\text{ary}), S(\text{ue}), B+C, B+M, B+S, C+M, C+S, M+S, B+C+M, B+C+S, B+M+S, C+M+S, B+C+M+S\}$

Adopting this algebraic view of nominal expressions, I propose (20). Given (20), the value of *subete-no-gakusei* is identified with the value of  $B+C+M+S$  in this world, since it is the maximal member in the set (19).

(20) *Subete-no-NP* can denote the maximal individual in the set denoted by the NP.

Then, suppose that the previous context designates (19) as the generator of alternatives whose members can substitute in the position of the focus-phrase. The set of alternative propositions for (15a) introduced by the context can be described as in (21).

(21)  $\{\text{let}(j, p = \text{read}(B, \textit{lgb})), \text{let}(j, p = \text{read}(C, \textit{lgb})), \text{let}(j, p = \text{read}(M, \textit{lgb})), \text{let}(j, p = \text{read}(S, \textit{lgb})), \text{let}(j, p = \text{read}(B+C, \textit{lgb})), \text{let}(j, p = \text{read}(B+M, \textit{lgb})), \dots\}$

Suppose that, in the situation in (15c), the two students that John let read LGB are Bill and Carl. Since *subete-no-gakusei*, whose value is identified with the value of  $B+C+M+S$  by (20), is basically an independent individual from  $B+C$ , the true alternative proposition ‘ $\text{let}(j, p = \text{read}(B+C, \textit{lgb}))$ ’ no longer contradicts the ordinary semantic value given in (18).

However, one problem arises here. If *subete-no-gakusei* in (17) also denotes the name of the maximal individual, (17) would not be false in the situation in

(15c), contrary to our intuition. Therefore, both the case where *subete-no-gakusei* unambiguously denotes the name of the individual and the case where it is freely ambiguous between an individual and a generalized quantifier seem unlikely. At this moment, I have two speculative solutions to the problem.

One speculative solution is to appeal to the proposal by É Kiss & Gyuris (2003). In fact, they make a similar proposal to the one given here, i.e., a universal quantifier in Hungarian is an individual-denoting expression if it is a contrastive topic. They claim that only a referential expression can be a topic. Given this, the topic universal quantifier must be individuated, since it is often assumed that a universal quantifier is a non-referential expression. As mentioned in Footnote 4, contrastive *wa* superficially has the same form as the form of topic *wa*. If contrastive *wa* also maintains its status as a topic-particle, this speculation might predict that the associated *subete-no*-NP is individuated only in (15a).

The other speculation is to appeal to another possibility. Although I am not sure whether or not it is a tenable assumption, let us assume that either a generalized quantifier in general, or at least a universal *subete-no*-NP, is somehow defective in its ability to create a generator of alternatives. Once a universal *subete-no*-NP is contrasted by *wa*, however, it faces a conflict, since the defective nature of the associated universal *subete-no*-NP cannot satisfy the demand on a set of alternatives called for by contrastive *wa*. My hope is that, to resolve the conflict, the semantic type of the associated universal *subete-no*-NP is lowered from  $\langle et, t \rangle$  to  $\langle e \rangle$ : as suggested by the structured set (19), its individual counterpart can produce a generator of alternatives.

Obviously, however, both speculations have problems.<sup>13</sup> Thus, at this stage, I simply stipulate that *subete-no*-NP is basically a universal quantifier, and that the association of contrastive *wa* lowers the semantic type of the universal *subete-no*-NP from  $\langle et, t \rangle$  to  $\langle e \rangle$  (see also Partee 1987).

---

<sup>13</sup> As for the first speculation, whether or not a non-referential expression such as a quantifier can be a topic is less clear. In addition, even if the observation that a non-referential expression cannot be a topic is correct, the reason why it cannot is unclear. As for the second speculation, whether or not a (universal) quantifier can produce a generator of alternatives is unclear. In fact, some previous studies (see Hara to appear; Nakanishi 2007) claim that those propositions whose values are e.g. ‘John let most students read LGB’, ‘John let some students read LGB’, ‘John let few students read LGB’, etc. can be alternative propositions for (15a). To develop the second speculation, I have to prove that none of them can be its alternative propositions.

## 5. Summary and future research

Through the investigation of the semantic value of a sentence with the contrastive *wa*-particle, this paper first observed that no scope shifting takes place in its association with *subete-no*-NP, though the sentence apparently exhibits wide scope negation. In addition, it argued that, contrary to intuition, the *wa*-sentence whose semantic description is computed in terms of alternative semantics cannot express the intended wide scope negation as long as it is assumed that the contrasted *subete-no*-NP is a universal quantifier. To account for the intuition, this paper proposed the alternative that the contrasted *subete-no*-NP can denote the name of the maximal individual in the set denoted by the NP. Other than the problem mentioned in the previous section, however, this proposal seems to face at least one problem.

One might claim that, if (17) is potentially ambiguous between wide and narrow scope negation (and its wide scope negation is absent due to other factors such as pragmatics), the puzzle mentioned in this paper may not be a puzzle anymore.<sup>14</sup>

I have two comments on this claim. First, as observed in Section 1.1, I do not find wide scope negation in (17), and I believe that its unacceptability in the situation in (15c) is not due to pragmatic factors such as felicity, preference and so on, but simply due to its falsity.

Second, some previous studies report that Japanese has a case where a sentence with a universal quantifier and negation exhibits scope ambiguity. At the same time, it is also reported that Japanese has a case where a sentence with both of these elements never exhibits such scope ambiguity (and only has narrow scope negation). For example, Miyagawa (2001) reports that (22a) has no wide scope

---

<sup>14</sup> Some previous studies propose a semantics of a sentence with contrastive *wa* whose *wa*-less counterpart is ambiguous between wide and narrow scope negation with respect to the associated universal quantifier (see Hara to appear; Nakanishi 2007). As long as their observations about their *wa*-less sentences are accurate, the puzzle discussed in Section 3 does not seem to arise in their cases. Due to space limitations, this paper does not mention any details of their studies. However, one thing that I would like to note here is the following. As far as I can see, none of the studies verifies whether or not the ambiguity in their *wa*-less sentences is really scope ambiguity. If their intuition that their *wa*-less sentences are true in the wide scope negation case is not due to the scope relation between the two scope bearing elements, but instead due to other reasons, the puzzle may remain even in their cases. I leave further discussions on this issue for future research.

negation over *zen'in*.<sup>15</sup> Once its *zen'in* is followed by contrastive *wa*, however, the implicated wide scope negation emerges. Therefore, I believe that the puzzle is real.

# The Charter of Regional and Minority Languages as a political factor

Camiel Hamans

Dutch delegation PSE-group  
European Parliament Brussels/Strasbourg

## Abstract

In this paper the genesis of the Charter of Regional and Minority Languages (1992) is discussed briefly, just as the current politico-linguistic situation in a few European languages with respect to the Charter. Especially the position of the Russian speaking minority in the Ukraine, one of the partners of the Charter, is compared with that of the Russian speaking minorities in Latvia and Estonia.

The role and the positive effect of the periodical reports of the Committee of Experts of the Council of Europe is sketched. In the conclusion a possible role of the Strasbourg Court of Justice is foreseen where it comes to strengthening of linguistic rights via case law.

**Reference terms:** Linguistic Rights, Minority Languages, Russian speakers in the Ukraine and the Baltic States, Charter of Regional and Minority Languages

## 1. Introduction

November 1992 the Council of Europe accepted a Charter of Regional and Minority Languages, which came into force March 1998 after eight Member States of the Council of Europe had ratified it. At present 23 Member States ratified the Charter, ten other countries signed the Treaty but did not ratify it so far. Among this last group one finds not only Malta, which signed the Charter immediately in 1992, but also France which put its signature in 1999 already and Poland that signed the Charter in 2003.

In the Preamble of the Charter the ‘Contracting States’ first realize:

that the protection of the historical regional or minority languages of Europe, some of which are in danger of eventual extinction, contributes to the maintenance and development of Europe’s cultural wealth and traditions;

subsequently state:

that the right to use a regional or minority language in private and public life is an inalienable right conforming to the principles embodied in the United Nations International Covenant on Civil and Political Rights, and according to the spirit of the Council of Europe Convention for the Protection of Human Rights and Fundamental Freedoms

and finally come to the conclusion:

that the protection and promotion of regional or minority languages in the different countries and regions of Europe represent an important contribution to the building of a Europe based on the principles of democracy and cultural diversity within the framework of national sovereignty and territorial integrity. (Charter: Preamble)

By regional or minority languages the Charter means languages that are:

- i. “traditionally used within a given territory of a State by nationals of that State who form a group numerically smaller than the rest of the State’s population;
- ii. different from the official language(s) of that State”; (Charter: art.1)

Furthermore these languages should not be either dialects of the official language(s) of the State or the languages of migrants. (Charter: art.1)

The Charter also distinguishes ‘non-territorial languages’, “languages used by nationals of the State which differ from the language or languages used by the rest of the State’s population but which, although traditionally used within the territory of the State, cannot be identified with a particular area thereof” (Charter: art.1). Usually languages such as Roma and Yiddish are concerned as non-territorial.

The Charter makes a difference between recognition according to Part II and Part III. Part II is a general part setting down the objectives and common principles for all states and all languages.

Part III lists concrete, specific undertakings which may vary from country to country and language to language.

Recognition of a language under Part II is a simple recognition as a minority or regional language tout court, whereas recognition under Part III forces a country to protect and support this regional or minority language actively. This difference roughly corresponds to the Romaine’s distinction between ‘tolerance rights’ and ‘promotion rights’ (Romaine 2008: 87).

The Charter explicitly excludes dialects and the languages of recently arrived immigrants. Therefore acceptance or promotion of these languages are not discussed in the Charter.

## 2. Previous History

The Charter did not arrive like a bolt from the blue. In the Parliamentary Assembly of the Council of Europe as well as in the European Parliament there had been discussions on minority rights and linguistic rights already for some decades (cf. Hamans 2006, Nic Shuibhne 2002). As early as in 1950 the Council of Europe accepted the ‘Convention for the Protection of Human Rights and Fundamental Freedoms’. In 1995 the Council added the ‘Framework Convention for the Protection of National Minorities’ to its catalogue of treaties.

On the multilateral level there is a legal relation between the Charter of Regional and Minority Languages and the ‘Universal Declaration of Human Rights’(United Nations, 1948, see for the text also Puppel 2007: 17-23) just as to the ‘International Covenant on Civil and Political Rights’ and the ‘International Covenant on Economic, Social and Cultural Rights’(both United Nations, 1966, also Puppel: 81-83).

In this same period of Cold War the OSCE propagated democracy, civil rights, state of law and the protection of diversity via the ‘Act of Helsinki’(1975) and later after the collapse of the Warsaw pact via the ‘Charter of Paris for a New Europe’ (1990). The nineties of the last century showed a growing interest in minority rights and linguistic rights.

“Efforts at developing international norms of minority rights at both global and regional levels have resulted in a post-1990 flood of international declarations, conventions and recommendations, including, for example, the United Nations Declaration on the Rights of Persons Belonging to National or Ethnic, Religious, and Linguistic Minorities (1992), the Framework Convention for the protection of National Minorities (1995) and the Declaration on the Rights of Indigenous Peoples (2007)”(Romaine 2008: 87)

In this same period the European Union formulated the Copenhagen Accession Criteria in 1993, which explicitly expected future Member States of the EU to respect and to protect minorities.

Not only in the field of international politics linguistic minority rights attracted interest. In the sixties and seventies of the last century a new linguistic discipline emerged, sociolinguistics, which among other things concentrates on the socio-political consequences of linguistic behaviour. The rise of sociolinguistics can not be seen apart from the interest in language disadvantages, equal rights and other aspects of linguistic diversity. (cf. Hamans 2006).

Although these dates and facts suggest acceptance of linguistic rights of minorities was a simple point of culmination in the history of civil rights, this is a misunderstanding. The 19<sup>th</sup> and the early 20<sup>th</sup> century show a different picture.

At the moment the Jacobins took over power during the French revolution the fate of linguistic diversity in France was determined: *égalité*, 'equality' became the watchword. For the linguistic diversity of France this implied extinction. The new French government was even more eager than the previous ones to build a uniform nation state, in which everybody should be equal and should get education. One and the same language was the only solution therefore (Spolsky 2004: 63-65, Van der Horst 2008: 199-2000), or in the words of the slogan of those days "*La langue doit être une comme la République*", the language should be one just as the republic. (Chaurand 1969: 93).

In Germany something similar happened, not due to a same extremely rationalist philosophy, but also because of a nation building movement. Germany under Bismarck finally became a unity, with all romantic ideas of identity which go together with a growing nationalistic consciousness. In this program there was not much room for linguistic diversity and minority rights. "Belonging to a linguistic minority was commonly a cause for peripheralization, exclusion or, at best forced assimilation. Compulsory education and universal military service became techniques for standardizing the national language"(Spolsky 2004:115).

The period after the Second World War, mentioned above, was not the first time in which rights of minorities, including their linguistic rights, were guaranteed. Although the Austro-Hungarian Empire (1867-1918) was the first Central-European government to guarantee linguistic rights formally (cf. Taylor 1948), already the Act of the Congress of Vienna (1815) permitted the use of Polish in some parts of the Austrian empire (de Varennes 1997).

Article 19 of the Austro-Hungarian constitution stated that "all races of the empire have equal rights, and every race has an inviolable right to the preservation and use of its own nationality and language". Nevertheless the implementation of this principle led to several disputes. Officially all customary languages, *landesübliche Sprache*, were equal, in fact it took a handful of nationalistic Slavic movements to get the Slavic languages, spoken on the territory of the Empire, accepted and recognized as equal.

After the First World War the treaties which set up the countries in the Balkans called for equality and linguistic rights (Spolsky (2004: 116), but often these rights only existed on paper and could not be implemented.

After the Russian Revolution the Soviet Union granted rights to all ethnic languages as well. The reason thereof was that the government wanted to teach "literacy and socialism in the fastest practical way", which was via the ethnic languages the different people and nations spoke. In the thirties, when Stalin had succeeded Lenin, this approach was abandoned because of the resistance against collectivization which was supposed to be of nationalistic origin.

Stalin's program of homogenization and elimination of ethnic differences might be considered as a continuation of the russification under the Czars. (Spolsky 2004:116/7)

### 3. Monolingualism

The Charter of Regional and Minority Languages stresses the equal rights of speakers of different mother tongues and in this way is a medium to promote antidiscrimination.

However, in France the principle of equality and non-discrimination has been understood just opposite. In the French tradition starting with the Enlightenment equality does not imply the acceptance of differences but just the other way round. It means to abolish and to equalize differences. Equality does not mean equal chances and possibilities in the French interpretation, but literally being equal. It is for that reason that Article 2 of the French Constitution says: "The language of the Republic shall be French". Everybody shall speak the same language. Because of this France even though it signed the Charter never ratified it, since the Conseil constitutionnel interpreted the Charter to be in conflict with the national constitution. (Montfrans 2004).

But times are changing, even in France. The speakers of the 75 regional and minority languages of the republic do not accept their languages to be considered inferior anymore. So there is a continuous but so far unsuccessful political pressure to grant linguistic and educational rights to these languages. The French Academy, which feels itself the guardian of the purity of the French language, keeps warning against legal recognition of regional languages. June 2008 the Academy called again recognition of regional languages an attack on French national identity. Local language militants ridicule the outdated nationalism of the *Académiciens* (Chrisafis 2008). In the French regional press a senator from the Occitan speaking area who voted against the recognition of the regional languages was advised to change his Occitan name Mortemousque into the French Mouche Morte, dead fly (Peyrouny 2008).

The attitude of the French Academy towards the issue of minority languages is typical for the French idea of homogeneity. In France the idea that a person can be both a French citizen and have an ethnic or religious identity is unacceptable, whereas for instance in Britain, Sweden and modern Germany community cohesion promotes the combining of race and faith with the idea of being British, Swedish or German.

France is not the only European country which defends official monolingualism. Greece has the same approach. Poland, which was one of the most heterogeneous countries of Europe till 1939, claimed to be a country without minorities after the Second World War. This must be seen as typical of the Stalinist practice of the whole of Eastern Europe Policy (Moskal 2004). Almost immediately after the collapse of the Warsaw Pact the then minister of Social Affairs and former dissident Jacek Kuron tried to introduce legal rights for speakers of regional and minority languages. Unfortunately it took fifteen years and serious pressure from the European Union via the Copenhagen Accession Criteria till on the 1 of May 2005, a year after EU-accession, before a law on national minorities came into force.

This law contains a threshold of 20%, which means that in a community a minority should be bigger than 20 percent before it may practice its rights. This is the so called 'Territorial Principle'. In the Sejm, the Polish lower house, the members of parliament proposed and voted in favor of a threshold of 50%. The final result, which is still 20%, is that there are only 42 municipalities with minority language rights, and what is more there is no village, town or city where Roma received linguistic rights.

The law makes a difference between three types of languages: regional languages such as Kashubian and Silesian, minority languages such as Byelorussian and German and diaspora languages (non-territorial languages in the wording of the charter) such as Yiddish and Armenian. Altogether 16 languages other than Polish have been recognized.

Not only Stalinism objected against pluralism. The same happened in Franco's Spain.

During the second Spanish Republic (1931-196), a statute of autonomy was approved by the Spanish Parliament for Catalonia in 1931 and for the Basque country in October 1936. In Galicia the process was not completed owing to the dramatic events of the 1936-1939 Civil War.

The Franco regime represents a brutal interruption of the process of recognition and use of traditional regional or minority languages of Spain that had just started. Their public use was forbidden, books written in these languages were burnt in public, and regional names were erased from the toponymy and civil registers. In practice, it was prohibited to speak regional or minority languages. Printing offices were subject to brutal censorship. Many regional or minority language writers and artist decided to go in exile. (Evaluation Report Experts Spain 2005)

When Franco died, 20 November 1975, the situation changed. Democracy was restored in 1978. The new Constitution offered a possibility for autonomy of different regions and long before Spain ratified the Charter in 2001 the Basque (1978/9), Galician (1981), Valencian (1982) and Catalan (1983) languages have been recognized as regional languages.

The acceptance of autonomy and of the linguistic rights of other languages than Castilian Spanish became a matter of political discussion, the left being in favor of autonomy and minority rights, the right against it, except for Valencian. That is since Valencia, where the right is in the majority, does not want to be associated with Catalonia, where the parties from the left usually form the regional government.

A few years ago (2005/6) the Spanish government defended the rights of speakers of Basque, Catalan and Galician to use their language officially outside Spain as well. The EU accepted the right of the speakers of these three languages to address themselves to the European authorities in their native languages, but it is Spain and not the EU that pays for the extra costs. So in terms of Romaine's (2008) distinction Spain granted the speakers of Basque, Catalan and Galician the promotional linguistic rights whereas the EU accepted only tolerance rights.

This set an example for Welsh as well. Recently the British government agreed with a request of the Welsh Assembly Government to acquire the status of "co-official language" too. The European Council, which is the Council of EU prime-ministers, still has to decide upon this proposal.

#### **4. Equal Rights**

In some countries equal rights for speakers of different languages imply full equality of languages. This is for instance the case in Belgium, where the linguistic controversies forced the government to restructure the country in a federal way according to the official languages spoken.

Belgium now is a federal state with four territorial linguistic regimes, Flanders, the Walloon provinces, the German speaking eastern part of Belgium and bilingual Brussels.

Unfortunately the Belgium language war is not completely over. There is still discussion about the linguistic status of Brussels and the municipalities around the capital.

That and the reminiscence of the vehement language quarrels prevented Belgium to join the Charter. The Belgium government had already enough troubles with the four national languages and therefore did not hanker after more languages and complications.

However, multilingualism does not have to be synonymous to problems. The cases of Luxembourg, Finland and Switzerland show that different national languages smoothly may go together.

Switzerland, where the recognition of national languages is a matter of the federation just as in Belgium, nicely shows that multilingualism does not imply necessarily language wars. Switzerland, which is one of the 'contracting partners' of the Charter, recognizes four national languages, German, French, Italian and from 1996 on Romansh. Two of these languages are called 'lesser widely used official languages' and are granted special protection under Part III of the Charter therefore. The Swiss cantons themselves designate which language(s) are the official languages of each canton.

Luxembourg, which is a partner in the Charter as well, recognized its most widely used language *Letzebuergesch*, 'Luxembourgish' as late as only in 1984 as the official language of the Grand-Duchy next to the two other widely used languages German and French. In the Law on the Linguistic Regime French is called the legislative language. French, German and Luxembourgish may be used in administrative and juridical matters (Nic Shuibhne 2002: 306). Most of the inhabitants of Luxembourg are bi- or even trilingual.

Finland is a third and peaceful example of linguistic coexistence. Finland has two national languages at the institutional level, Finnish and Swedish, the latter the language of a former colonial or occupying power. Under Part III of the Charter Finland recognizes Swedish also, since the use of this language declines and needs protection for that reason. Next to Swedish Finland recognizes Sami, which is almost an endangered language. Finland accepts a few more languages under Part II (simple recognition), such as Karelian, Russian, Tatar and Kaló, a Roma language.

## **5. Rights at a different level**

In traditionally monolingual countries the Charter usually leads to the recognition of languages at a different level than the official or national language.

In the UK for instance three regional languages are accepted under Part III. These are Scottish Gaelic, Irish and Welsh. Cornish, Manx Gaelic, Ulster Scots and Scots are recognized under Part II. The regional authorities are expected to take care of the regional languages.

Although the status of the regional languages is not the same as that of English, the British Nationality Act of 1981 grants British citizenship to speakers of English, Welsh and Gaelic (State Periodical Report UK 2002). It is not known whether ever in a process of naturalization Welsh or Gaelic was used as to qualify for British nationality.

In Sweden, Norway, Denmark and the Netherlands there have been recognized regional, minority and non territorial languages such as Sami, Finnish, Meänkieli, Romani Chib and Yiddish in Sweden, Sami in Norway and later - under the pressure of the experts of the Council of Europe who monitor the application of the Charter each three years - , also Kven, a language which resembles Meänkieli, German, Faroese and Greenlandic in Denmark and Frisian in the Netherlands as a Part III language. In the Netherlands Low Saxon and

Limburger have been recognized as Part II languages after a serious scholarly and political discussion. The language of the province of Zeeland, being a dialect of Dutch, was not accepted to the great dissatisfaction of the provincial authorities.

The same happened in Sweden with the widely spread and used Skanian (Spolski 2004: 123) and Elfdalian, a small language spoken in the Dalarna County. The experts of the Council of Europe asked for serious research on this matter in their evaluation report of 2006. Germany is one of the countries that carefully makes a distinction between minority languages such as Danish, Frisian, Sorbian and the regional language Low German, known in the Netherlands as Low Saxon. Romany, although being a non territorial language, is called a minority language in the German reports.

From these examples and enumerations it may be clear that not all regional and minority languages are of the same kind. There is a huge difference between a minority, or regional language which is a national language in a neighboring country, such as for instance German in Denmark and a language that misses such a powerful sister, such as Sorbian. Especially in Central Europe this distinction plays a crucial role. For instance Hungary supports the protection, encouragement and propagation of Hungarian in Slovakia and in other regions where Hungarian is a minority language, whereas Ruthenian in Slovakia has to survive without external aid.

## **6. The Role of the Charter**

The Charter is not only a non-binding inventory of the cultural and linguistic wealth of the 'contracting partner states', the Charter is an international Treaty. Although the Council of Europe has no political, legal or economic power, since the Council monitors the application of the Charter each three years conscientiously the public opinion forces governments to accommodate by naming and shaming.

Hungary and Slovakia are for instance seriously criticized for their treatment of speakers Roma. The experts of the council of Europe say loudly and clear that integration, which is a good thing, is not the same as assimilation.

The Committee of Experts recalls in the first Place that the Charter does not question at all the need to acquire an adequate command of the State's official language(s). Indeed, the Preamble of the Charter states explicitly that "the protection and encouragement of regional or minority languages should not be to the detriment of the official languages and the need to learn them". Furthermore the wish of the Romany-speakers to see their children successfully integrated in the Slovak society is fully understandable and deserves the maximum support, taking special account of the unfavorable economic, social and political conditions from which Roma have suffered for centuries in most European countries. However, integration should not be confused with assimilation and all the information at the Committee of Experts disposal indicates that full recognition of the linguistic and cultural specificities of Roma is conducive to their successful integration in the society.( Evaluation report Experts Slovakia 2004)

Whereas the experts of the Council of Europe are not the only one to criticize the Slovak government on its treatment of the Roma minority, this well documented criticism may have some effect.

The monitoring process together with the publication of the reports and other documents is the only instrument the Charter has. But it may be effective.

The experts remain critical about thresholds levels and question the effectiveness thereof. The threshold in the national Slovak legislation is so high, 20%, that some linguistic minorities never may enjoy the effect of the Charter. Even the Czech minority, consisting of almost 50.000 speakers, nowhere is in a position to profit from the language laws. The Slovak government has to answer the experts and the Committee of Ministers, whereas Poland which only recently joined the Charter so far never had to render account for this.

The same applies to the Croatian system where there is also and even a higher threshold level of 1/3 of the population of a municipality, but where local authorities have a certain competence to grant linguistic rights to the minority in their community. The experts found that this only appears where bilingualism has been accepted since long. For non traditionally accepted minorities the disfavoring still remains.

The experts more often complain about the practice that national authorities delegate the care for regional and minority languages to regional authorities or to the *Länder* as in Germany. The national state is partner in this international treaty, thus national authorities have to take care of the regional and minority languages. Of course national authorities may delegate the actual care to lower authorities, but this does not mean that these national authorities may hide themselves behind regional and local authorities and their small budgets. Recently the Dutch national government got a hard rap over the knuckles from the Committee of experts. The experts blamed the national Dutch government for its delegation of duties to regional authorities and for the limited budgets and efforts which resulted thereof for the promotion of regional and minority languages. This criticism was big news in the Dutch newspapers (*Algemeen Dagblad* 12 July 2008).

The reports of the Committees of experts also reveal that there may be a discrepancy between the law and the daily practice in a country. In Serbia legally everything seems to be in good order, actually one learns from a letter by the Council of Rumanian Ethnic Minorities that “the positive legal norms are not applied in practice”( Evaluation Report Expert Serbia 2007)

## **7. Difference in interpretation**

Sometimes there has been a discussion between a national government and the Committee of experts whether a language should be considered as a minority or regional language or simply should be seen as a dialect or even as a phantom. Some countries, for instance Spain, Slovenia and Croatia, interpret the text of the Charter in such a way that only languages that have been listed by national authorities may be called minority or regional languages and may profit from this status.

In its discussion with the Slovenian government in 2006 the Committee made clear that each language which fulfils the requirements of the Charter automatically should receive recognition as a Part II language. There is no official assignment of any national authority required.

At the moment this opinion will become more widely known there might be expected that quite a few groups of speakers of so far not recognized languages will appeal tot the Charter and will claim a status with all internal political consequences thereof. (Evaluation Report Experts Slovenia 2006)

For instance the experts question why the government of Montenegro does not grant Part II status to Bosnian/Bosniac and Croatian along Albanian and Romani. At the moment a

study reveals that for instance Bosnian/Bosniac fulfils the requirements of the Charter it will be no longer up to the Montenegrin authorities to answer this question. (Evaluation Report Experts Montenegro 2007)

But it is not only the Committee of experts which criticizes national authorities. The comments of some governments are critical too. For instance: the experts' report and the following public Recommendation of the Committee of Ministers convinced the Norwegian authorities to recognize Kven as a minority language. However, in their answer the Norwegian authorities correctly pointed out what the problem is in collecting data about linguistic and ethnic background. The experts of the Council insisted on receiving recent and reliable figures especially with regard to the ethnic status of the population. The Norwegian government answered they understood the request of the Committee for this kind of information, but they hoped the Committee would have sympathy for the problem a government may have in producing this kind of statistics as well. After all quite often this type of information is not available, as in some countries it is seen as an infringement on somebody's privacy and rights to enquire about his/her linguistic and ethnic background, since these data can easily be used to discriminate people.

## **8. Russian in the Ukraine**

One of the last countries to join the Charter has been the Ukraine. The Ukraine listed 14 minorities and their languages in connection with the Charter. These languages are Belarussian, Bulgarian, Gagauzian, Greek, Jewish (?), Crimean Tartar, Moldovan, German, Polish, Russian, Romanian, Slovak and Hungarian.

All these languages are recognized under Part III, the active protection and promotion part. Nevertheless there is a difference between for instance Gagauzian and Russian. There are only 31.900 speakers of Gagauzian, mainly in the Odessa region, whereas there are about 13,5 million speakers of Russian in the Ukraine, who do not only live in the eastern part of the country but also in some concentration in Odessa, Kyiv and other big cities.

In the constitution of 1996, which came into force five years after the independence of the Ukraine on 24 August 1991, Ukrainian was granted status of 'national state language'. Along Ukrainian Russian received certain rights. A few years later it turned out that nevertheless the number of speakers of Russian had decreased, from 22,1% in 1989 to 17,3% in 2001.

Sociological and ethnological research studies and surveys suggest that such difference has to be explained not so much by the outflow of ethnic Russians but, rather, by re-identification of its permanent residents, especially the descendants of mixed, Ukrainian-Russian marriages. In the USSR, the term "Russian" was perceived as similar to "Soviet" and therefore, many Soviet citizens, especially from ethnically mixed families, preferred to be defined as "Russians" for career purposes. After the collapse of the USSR, such a perception has lost either practical or conceptual meaning; no wonder that is no more inherent in mass consciousness within the non-Russian successor states. (Belitser and Gerasymchuk 2008:56)

However, not everybody seems to be so happy with the secondary position of Russian, although there is ample possibility to follow Russian education. From the moment of the independence on the issue of extending status of second official language to Russian has been the subject of extensive, controversial discussion. In all presidential election campaigns it

plaid a role. In 2006 the Council of Kharkiv, Kharkiv City Rada, was the first to declare Russian to be an official regional language. Quite a few places followed, most of these decisions have been overturned by ruling of courts.

In the First State Periodical Report concerning the application of the Charter submitted by the Ukrainian Government to the Council of Europe in August 2007 nothing is found about this problem. It is to be expected that the Committee of experts will raise questions on this issue. In this way the Charter may be helpful or instrumental in solving or calming down this discussion.

## **9. Russian in the Baltic States**

In the Baltic States, especially Latvia and Estonia, a similar problem appears. However, there are major differences. Speakers of Russian and of Ukrainian who are exposed to the other language for some time understand that other language more or less, without having been taught the language explicitly. There is not such a familiarity and similarity between the Baltic languages and Russian.

Secondly the Baltic States felt colonized by Russia and the Soviet Union, whereas the Ukraine, which country even formally was independent in a certain way from Moscow during the Soviet times, felt occupied but by relatives. The Baltic States suffered from a serious Russification. Because of economic reasons quite a few Russians settled in the three formerly independent Baltic States or were sent to there. In 1989 only 52 % of the inhabitants of Latvia spoke Latvian, while the comparable figure in Estonia was 62%.

Russian was not only the official language during the Soviet period but also the language of instruction in Kindergarten as well as in universities. The position of Russian was dominant in the Soviet era. In these times professionals at an intellectual level seldom got an appointment in their own region. So Latvian physicians were sent to for instance Kazakhstan, whereas teachers from the Ukraine, Kirgizstan or Russia were appointed in the Baltic States. So a Soviet citizen who had to see a doctor or a dentist had to speak Russian, since the physician or dentist was not from his area and therefore did not speak the regional language. In the Ukraine this problem was less painful because of the comparable small distance between the two sister languages Russian and Ukrainian. In the Baltic States people felt humiliated by this practice. Apparently they and their language were second class.

That is why the Baltic States concentrated on nation building after their independence in 1991. (cf. Rannut 2004). This is the third difference between the Ukraine and the Baltic States.

As the Committee of experts rightly says: it is the majority which determines how a minority language will be perceived ((Evaluation Report Expert Slovakia 2004). In the case of the Baltic States this means that there was not only a certain nationalism involved in the attitude of Estonians and Latvians towards Russian, but also feelings of resentment against the former colonists plaid a role. (Joseph 2006: 11)

That is why the Baltic States, although being members of the Council of Europe, never considered signing and ratifying of the Charter to be an option. Nation building which involved standardization of their oppressed national languages and negative feelings towards Russians and Russian prevented them of doing so.

However, the Copenhagen Criteria for the accession to the EU forced the Baltic States to implement legislation in order to protect linguistic and ethnic minorities. In Estonia for instance national minorities with a membership of more than 3.000 are accepted as officially recognized minorities nowadays. This gives right to the Swedish, German, Jewish and of course Russian minorities to organize itself.

However, the main problem in Estonia and Latvia are the laws on citizenship. Whereas the British law even accepts knowledge of Gaelic and Welsh as sufficient for the British nationality, Estonia and Latvia require a certain degree of fluency in the national language before citizenship can be acquired. Because of different reasons there is a group of a few hundred thousand people who are stateless. They lost their Russian nationality and never made it to get the Estonian or Latvian citizenship. As a consequence they have no nationality anymore and are stateless.

It is quite clear that this is against all international law, especially against the Framework Convention for the Protection of National Minorities (Council of Europe 1995) and against the spirit of the Charter of Regional and Minority Languages.

Therefore it is a pity that the Baltic States do not take part in the Charter. In that case they would have been blamed vehemently of course because of their laws on citizenship and the deprivation of all minority rights for these group of stateless people. On the other hand the national, linguistic and educational authorities could have profited from discussions with the Committee of experts. Most likely the experts would have told the national authorities that calling the language of your former occupier a second national or a minority language, just as the Fins did with Swedish, or the Ukrainians did with Russian and Polish respectively, is not a vice or an admission of weakness but a sign of civilization.

It is to be hoped that the good example of the Ukraine will help the Baltic states to overcome their hard feelings and that they will not only join the Charter one day but also will give a decent place to Russian in their legislation.

## 10. Conclusion

As has been shown The Charter of Regional and Minority Languages is not a very powerful instrument. Since the Council of Europe is an institution without very much power and actual influence, the Treaties of the Council of Europe are of a lower legal status than for instance EU-regulations. On the other hand for countries which have signed and ratified the Charter it is binding. This does not imply very much, since the Charter itself is rather noncommittal in its wording and does not include sanctions. Tolerance and promotion, to use Romaine's terms, are vague and permissive. It is up to the Committee of experts to give an interpretation and evaluation of these notions.

Since the Charter is a Treaty of the Council of Europe minorities that feel neglected, discriminated or not treated well in language respects may go to the Court of Justice in Strasbourg, which is an institution of the Council of Europe and can be seen as the author of legally binding decisions. Minorities or individuals representing minorities can plead their cases with the Court. Possibly this may lead to case law and jurisprudence of the Court, as happened in quite a few individual complaints about language discrimination by national authorities. Already in one of the first cases, 'Ministère Public versus Robert Heinrich Maria Mutsch' (Nic Shuibhne 2002: 72-80), the Court declared that

[i]n the context of a Community based on the principles of free movement of persons and freedom of establishment the protection of the linguistic rights and privileges of individuals is of particular importance. (ibid: 74).

So far the Court of Justice has not been asked to give a verdict in a case of a language minority.

The monitoring reports of the Committee of experts are a far more effective weapon. The national authorities have to answer the comments and criticisms of the experts and are expected to improve the situation before the next round of inspections, but since the experts visit the countries and the regions and invite all stakeholders to provide the Committee with facts and data and to give their opinion on the linguistic situation in their region or country, the work of the Committee can better be seen as a wakeup call for all the interested parties.

Since the reports of the Committee are public, they influence the public opinion. Public opinion expressed by the media is the most powerful and effective weapon the Charter has at its disposal. In this way speakers of minority and regional language may get informed about their rights and chances. At the same time media also may put pressure on authorities. Together these two actions are the best means to promote the Charter and the linguistic rights of minorities.

## **Abstract**

This paper is a part of a larger project on the status of non-European immigrant languages in Denmark with a focus on Arabic. The working hypothesis is that states belonging to the Universal Welfare Model (Esping-Andersen 1990) tend to shape language policy at the national level in at least two ways: On the one hand, they develop a strong focus on the national language and subsequently a very elaborate infrastructure of teaching it as a second language; on the other, non-European immigrant languages hold a very weak position, if any, in the national language policy.<sup>1</sup> In what follows, I shall analyze the status of Arabic in the Danish educational sector as a part of this framework, in order to illustrate how non-European immigrant languages have to compete with the national language for educational resources, and how they are downgraded in the educational sector. And finally I shall point to some dilemmas arising from this policy in Danish education.

**Keywords:** Non-European immigrant languages, Arabic, language policy, education, welfare states.

## **1. Introduction**

Denmark is a small, democratic and highly globalized welfare state. Each of these characteristics influence Danish language policy in different ways: With a population of 5,45 million inhabitants – roughly half of greater Paris or one quarter of the metropolitan area of Seoul – and ranking 5th on the global top 20 on the world's most globalized countries (Kearney, 2006: 74, 77), Denmark is obviously very much dependant on the surrounding world, be it for economic development, technological innovation or national security. The high degree of globalization favors a language policy which sets English as a top priority and, at least ideally, focuses on the need for other foreign languages.

With the pressure from globalization comes an increased focus on Danish. This is not only due to cultural pressure from those who consider English a threat to the national language – an issue which is, at times, hotly debated in Danish media - but also to a political pressure from government, parliament and other decisionmakers who consider Danish a necessary gatekeeping mechanism to safeguard the Danish welfare state. Denmark belongs to what political scientists have labelled “the universal welfare

---

<sup>1</sup> The important exception to this is Sweden which attributes an important position to immigrant languages in its national language policy. It is a part of this project to define how the differences between Sweden and the other Nordic welfare states can be explained.

model” (Esping-Andersen, 1990)<sup>2</sup>, and Danish society is characterized by an important redistribution of wealth: The state takes responsibility for most social services, regardless of a person’s race, gender, ethnicity or religion, some services being universal and thus offered to all inhabitants regardless of income – health services, education and child allowances - while others are offered only to low income groups depending on individual needs and regulated by a detailed social legislation. In order to finance the expenditures of the welfare state, Denmark has a highly developed tax system, based on direct as well as indirect taxation.

The safety net which has thus been stretched out under all Danish citizens, makes Denmark attractive to non-European immigrants and with the open borders which the country shares with other memberstates of the European Union (EU), the pressure from immigration has necessitated a political response. As a memberstate of the EU, however, Denmark has limited means to establish its own barriers to immigration, but one which can be safely brought into play, is the use of the national language: If immigrants want to get access to many of the benefits of the welfare state, they must master Danish to a certain level, that is, they must take compulsory language classes, sit for tests and exams which in turn will allow them to apply for certain benefits. As such Danish has become a gatekeeping mechanism which ensures that in a globalized world which favors free movement of people across borders, the pressure from immigration will not lead to the breakdown of the welfare state (Nielsen, forthcoming)

Denmark is not only a small and globalized welfare state. It is also a democratic state, and consequently, Danish legislation includes language rights for minority languages. Denmark has ratified the European Charter for Regional or Minority Languages and has officially recognized three minority languages: Feroese, spoken by 50.000 at the Feroe Islands, Greenlandic, spoken by appr. 50.000 in Greenland, and German, spoken by appr. 15.000 at the Danish side of the German border (Indenrigs- og Sundhedsministeriet, 2006: 3). In practise, however, Feroese and Greenlandic are recognized and used as official languages in their islands respectively, together with Danish, but are not considered nor used as such in the mainland of Denmark.

Immigrant languages, on the other hand, have no officially recognized position in Danish legislation, apart from what is mentioned in the United Nations Human Rights Treaties which Denmark ratified for the first time in 1971 (United Nation, 2008). The treaties give all citizens the right to speak whatever language they want, and national legislation makes it further possible for minority groups to open private or independent day-care centers, kindergardens and schools, subsidized by the authorities (Ministry of Interior and Health, 2006: 6-7). Since the 1970’s Denmark has received a growing number of immigrants and asylum seekers, most of them of non-European origin. The total percentage of immigrants in Denmark amounts to 8.8%, corresponding to 478.000 persons, and non-European immigrants constitute app. 6.1% of the Danish population. The 10 most important non-European immigrant languages in Denmark today are Arabic, spoken mainly by Iraqis, Lebanese, Maroccians and Palestinians, and

---

<sup>2</sup> Most researchers define the welfare states of the western world as belonging to one of three categories: The universal welfare state, which prevails in e.g. the Scandinavian countries; a selective or labour market related welfare state prevailing in Central Europe; and a residual welfare state as in Great Britain and the US. See Esping-Andersen (1990) for more details.

Turkish, followed by Urdu and Somali, as shown in figure 1. These numbers are based on registered nationality, since Danish population statistics do not include information about languages, religion or ethnicity.

**Fig. 1:**  
**Top 10: Non-European Immigrants in Denmark** (Statistics Denmark, 2008: 5)

Turkey	56.585
Iraq	27.851
Lebanon/Palestin	23.249
Pakistan	19.347
Somalia	16.504
Iran	14.551
Vietnam	13.093
Afghanistan	11.554
Marocco	9.240
China	8.045
Total	<u>200.019</u>

Denmark also has an important number of European immigrants, most notably of German, Swedish, Norwegian and British origin (with 30.076, 19.876, 16.033 and 15.454 persons, respectively). These immigrants are not included in this study because their languages hold a very different position in Danish society from that of non-European languages: English, German and French are taught as foreign languages in primary and secondary schools, whereas Swedish and Norwegian are included in the curriculum of Danish, given that the three languages are mutually intelligible.

In what follows, I shall focus mainly on Arabic when presenting data on non-European immigrant languages. This is due to the fact that Arabs constitute the most important group of immigrants in terms of numbers, Arabic being supposedly the most widespread non-European language in Denmark. Furthermore, using the distinction made by Bagna, Machetti and Vedovelli (2003) between *migrant languages* and *immigrant languages*, Arabic in Denmark is considered a “true” immigrant language: Whereas migrant languages are defined as mainly passing through an area, e.g. as a result of short termed labour migration, and thus do not put down roots and leave signs on the host community’s language and linguistic landscape<sup>3</sup>, immigrant languages are considered a more stable phenomenon, due to the longterm presence of immigrant groups who intend to stay in the host community. An immigrant language therefore stands a better chance of leaving linguistic traces on the host society (Barni & Bagna, 2008: 298), and as such Arabic is well suited to illustrate what happens to non-European immigrant languages in the Danish welfare state.

---

<sup>3</sup> Polish is a good example of a migrant language in Denmark: The number of Polish speaking immigrants are currently growing, amounting to 25.725 (2008). Coming from a new memberstate of the EU, they are considered Europeans, but their language is not taught in primary and secondary schools. The current growth of Polish immigration to Denmark began in 2004 when Poland became a full member of the EU, and takes mainly the shape of short term labor migration.

## **2. The Danish Educational System**

One way of illustrating the status of non-European immigrant languages in Denmark is to analyze the language policy of the educational system. In theories of language policy, education – or what has been termed “the school domain” in language policy (Cooper, 1989, Spolsky 2004) – is seen as a key component in national language policy, because education requires a range of language choices to be made, and thus becomes an important domain used to create de facto language practices (Shohamy, 2006: 76). Language choices in education are influenced by a range of different agents, but there is a general consensus that the strongest influence comes from central authorities such as government agencies, ministries of education and regional and local educational boards (Shohamy, 2006: 77-78). Other agents such as parents, religious authorities and community leaders as well as local school directors, teachers and eventually the students themselves also influence language educational policy, but to a much lesser degree (Spolsky, 2004). The choices made by the central authorities on issues such as the language of instruction, what foreign languages to be taught, what status to attribute to mother tongue in case it differs from the school language, etc. are highly political and strongly influence language practices: Not only are children socialized into values and norms for language use through these choices; choices are in fact imposed on children since they are activated in a context which is compulsory for all children

The Danish educational system is divided into preschool (for children from 3 to 6 years), primary school (6 to 16-17), secondary school (16-19) and higher education. The Danish educational sector is highly centralized through laws and ministerial decrees, though preschool and primary schools are formally placed under the authority of the municipalities.

## **3. Preschool language activities**

About 95% of all children in Denmark go to kindergarden from the age of 3 to the age of 6 (Statistics Denmark, 2006: 1). The high percentage does not indicate that kindergarden is a compulsory part of the Danish school system, but has mainly to do with the high participation of women in the labour market. Except from a few private or independent institutions, most kindergardens are formally run by the municipalities. This has mainly economical implications; in practice, the kindergardens are dealt with as independent institutions acting freely inside a broad framework of pedagogical guidelines. From the mid 1990's, however, the Danish parliament started to include kindergardens in their immigration policies, and in 1999 it was decided that immigrant children between 4 and 6 years old should be offered specific Danish language training activities in kindergardens to prepare them for entering school. Immigrant children who did not go to kindergarden, should have access to the same kind of Danish language activities through the establishment of “playing groups” made available to them by the municipality, 15 hours a week, an activity most often located in a local school.

In 2002, these language activities were extended to immigrant children from 3 years of age (Law no. 412, 2002), and in 2004, what had until then been offered as something which immigrant families could take or leave, now became compulsory: The Danish Primary Education Act now stipulates that if an educator finds that an immigrant child does not possess satisfactory language skills in Danish, s/he will have to participate in Danish language activities offered to them (Primary Education Act, §4a, stk. 5). It has not been specified, however, what sanctions should be used against parents, should they refuse to act accordingly. And in 2005, the Ministry of Education issued a recommendation that immigrant preschool children should be screened or tested in Danish on a regular basis, e.g. once a year, so as to make sure that they progress adequately in Danish and thus are ready to benefit maximally from what they will learn in school.

Based on these political decisions it seems safe to conclude that during the last 10 years, the national political agenda has been in favor of upgrading Danish for preschool immigrant children.

#### **4. Primary school**

Primary schools in Denmark are strongly regulated by the Ministry of Education, whereas the implementation and the administration are run by the municipalities. In recent years, there has been much debate about the position of the Danish language in primary school (number of hours, curriculum etc.), fuelled by an increasing pressure from those who consider English a threat to the national language on the one hand, and the declining results of Danish students in the international PISA reading tests on the other (Ministry of Education, 2006: 4). This has led to an increasing number of teaching hours of Danish in primary school as well as more focus on research and new methods of teaching how to read Danish, to the benefit of all school children, including immigrants.

While Danish has been upgraded in primary school, mother tongue education in non-European immigrant languages has been downgraded: According to the Primary Education Act of June 26<sup>th</sup>, 1975, immigrant children in Denmark used to have access to free mother tongue education, organized by the local authorities whose costs were in turn reimbursed by the state. It was stipulated that children would get 3 to 5 weekly hours of instruction in their mother tongue, that these classes were to take place at public schools outside normal class hours, and that the teachers of mother tongue instruction should be approved by the local school authorities, though they did not have to be certified teachers. There should be at least 12 children in a class – if less students, then less hours (Kristiansdottir, 2006: 8). From 1993 to 2001, this right was challenged 14 times by M.P.s from the Danish People's Party, the Liberal Party and the Conservatives, who proposed, in motion after motion, to limit or abolish this right, despite the fact that it was unrealistic, politically, to put through a majority vote against the law, due to the political composition of the parliament (Nielsen, 2007: 14).

When a liberal-conservative coalition took over the Danish government in 2001, they immediately initiated legislative work which led to a law reform in 2002: It was now left to the local authorities to decide if they wanted to offer free mother tongue education in immigrant languages, the main difference being that the state would no

longer reimburse the costs. In that way, the government did not formally abolish the right to free mother tongue education in immigrant languages; they only placed the responsibility for it at a different administrative level. It was stipulated in the law that the money saved by the state should now be used for Danish language activities for immigrant pre-school children (Law no. 412, 2002). This led to a dramatic downsizing in the number of classes in mother tongue education all over the country: Most of the local authorities having been in constant need for money over the years, could (or would) not afford to pay for mother tongue education. Four years later, in 2006, only 4 out of the 20 municipalities with most immigrants still offered free mother tongue education, and 2 of these had limited their offer to children up to the 3<sup>rd</sup> and 5<sup>th</sup> grade (Schnabel, 2006: 5). A year later, one of these municipalities, that of Copenhagen which has the highest proportion of immigrant children in Denmark, also decided, for budgetary reasons, to stop free mother tongue education.

There was, however, one important exception to the law on mother tongue education: As a member state of the EU, Denmark is legally required to offer mother tongue education in European languages, if there is a demand for it. The idea is to ensure the free movement of labour in Europe, and to guarantee the right for European children to keep up with their mother tongue while living with their parents abroad. Therefore, the law reform on mother tongue education only involved non-European languages, and consequently, Denmark has a legally adopted language policy which discriminates between children: Today, an English speaking child has a legal right to get free mother tongue education, because English is an officially recognized language of a European memberstate, while an Arabic speaking child has to content him- or herself with the Arabic instruction s/he can get in the local mosque or pay for it at an Arab private school, because Arabic is not a European language. Thus, the same municipality may well offer free mother tongue classes for Dutch or Polish children whose parents can easily afford to pay for their classes, whereas they do not support classes for the hundreds of Arab and Turkish children, whose parents often cannot afford it. This is e.g. the case in the municipality of Odense, the third largest city in Denmark, with appr. 187.000 inhabitants, where 19 Dutch, 14 Spanish, 13 Polish and 12 Icelandic children take free mother tongue classes, whereas 1290 Middle eastern, mainly Arabs, 479 Somali and 385 Turkish children were not even offered any classes (Odense kommune, 2007).

## **5. Secondary school**

Secondary school in Denmark has a long tradition for teaching foreign languages and for allowing students to choose among a wide range of foreign languages. Furthermore, Denmark follows the European Council's recommendation from 1995 stating that students should, as a rule, have the opportunity to learn two languages of the European Union in addition to their mother tongue. In secondary school, therefore, students continue to study English which is compulsory from 3<sup>rd</sup> grade in primary school onwards, and are offered the possibility of either to continue German or French which are offered from the 7<sup>th</sup> grade in primary school or to study a different foreign language, such as Spanish, Italian or Russian, pending on what the secondary schools offer (Primary Education Act, 2003, §5 & 14; Ministry of Education, 2007).

In 2003, the Danish Parliament decided on a ground breaking reform of the secondary school which aimed at ensuring that young Danes will be able to meet the demands of a globalized society. The reform which was implemented in 2005, added Arabic and Turkish to the secondary school curriculum as optional foreign language courses, pending on the schools' availability of teachers. This came about as a result of the opposition's pressure on the government to offer immigrant languages, not only because of the size and importance of these languages in today's world, but also to raise the status of these languages in a Danish context. Chinese and Japanese languages were also added to the curriculum, not because they were considered immigrant languages, but mainly because of China's and Japan's rising economic power in the global economy (Ministry of Education, 2007).

As a consequence of the reform, foreign language classes now fall into one of three categories: (1) Compulsory foreign languages, comprising English and a second foreign language; students can opt between German, French, Italian, Russian or Spanish. (2) Foreign languages as a specialization: Students must choose a profile of either natural sciences, social sciences or arts - humanities related subjects, or a mixture of it; in case they opt for languages, they can choose between French, German, Greek, Italian, Latin, Russian and Spanish as well as upgrading their English. And (3) Optional foreign languages which students can take depending on the number of hours and subjects they have chosen for their specialization. Here students can opt, among other things, for Arabic, Chinese, Japanese and Turkish (Ministry of Education, 2007: Section 3).

The fact that two non-European immigrant languages are now offered as an option of the secondary school language programme, adds to the status of immigrant languages. However, since they belong to the optional category of languages, they are at the same time the least prestigious, and experience actually shows that there has been very little interest in establishing classes in these languages: Three years after the implementation of the reform, there is only one school in the entire country offering one class in Arabic and one class in Turkish and apparently no schools preparing to offer these languages in a foreseeable future. This situation cannot be explained only with reference to the low status often attributed to immigrant language: There seems to be a genuine interest in taking Arabic classes among second generation immigrants in Denmark – a phenomenon I shall return to below, when describing the demand for Arabic at university level – but many secondary schools either will not or cannot offer such courses, partly because of lack of teachers, partly because language teachers of French, German, Spanish and other foreign languages try to prevent new languages from entering their schools, by fear that there will be even less students opting for the languages they teach.<sup>4</sup> This mixture of low prestige, lack of teachers and professional language teacher infight is very illustrative of the weak position of these languages in the secondary school system and does certainly not seem promising for the future.

## **6. Higher Education**

---

<sup>4</sup> This information is based on a number of personal communications which the author had with secondary school language teachers as well as directors of such schools.

Unlike the position of Arabic and Turkish in the secondary school system, there is a long tradition in Denmark for offering university programmes in these languages, the first Arabic programme dating back to 1492 at Copenhagen University. What has characterized these programmes over the years is that they are mostly philological in nature with a focus on literature and linguistic science. Since 1992, however, it is possible to study Arabic as a modern foreign language as a part of a business degree, or, since 2005, as a part of a communication studies degree. These programmes cover the Danish labor market's need for graduates with language skills in Arabic to be employed in exporting companies working with business or marketing related issues.

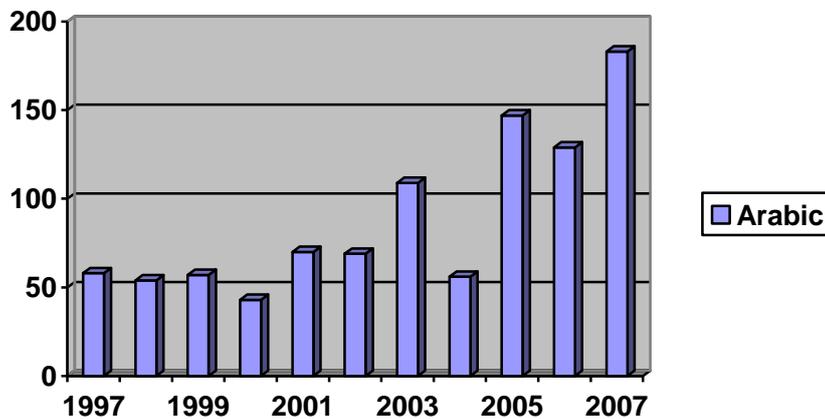

When it comes to the needs of the Danish public sector, however, things are quite different: In a welfare state where immigrants are taken care of by the state in many aspects, there is a dire need for certified translators and interpreters who can assist the authorities when Arab speaking immigrants with little knowledge of Danish are to interact with the authorities. Social workers, hospitals and doctors, legal offices and criminal courts have been crying out for qualified translators and interpreters in Arabic for many years (Courts of Denmark, 2003: 3-6; Andersen, M. 2003: 152), only to be met with silence from universities and ministeries. This educational void is most probably due to the fact that the need for translators is caught up in a vacuum between universities arguing that such programmes are too expensive to run on the usual financial conditions, whereas the Ministry of Education and the Ministry of Science and Technology have declined to offer any special support. As a result, there is no established program to train certified translators or interpreters in Arabic in the country, and therefore the public sector continues to employ native speakers of Arabic with no formal qualifications on a freelance basis to translate in courtrooms, at hospitals, etc. where so much can be at stake. This strategy keeps costs low for the authorities, given the fact that such freelancers are payed much less than certified translators of other languages, but it does not establish any mechanisms of quality check or guarantee any form of problem solving strategy in case serious misunderstandings arise.<sup>5</sup>

Since the end of the 1990's, there has been a growing interest in studying Arabic, be it in a traditional programme of Arabic language and literature or as a combined study degree of Arabic and business economics or communication studies. The growing interest can be seen from figure 2. This interest has come at a time where the number of students studying European foreign languages is decreasing: Apart from English which is by far the most important foreign language in Denmark at all levels, the number of students applying for language programmes of German, French, Russian and Spanish at university level has fallen significantly (KOT, 2008). This has led to a new situation in Danish Universities where Arabic is considered one of the big foreign languages, measured in numbers of students.

---

<sup>5</sup> The only attempt to remedy the lack of qualified translators and interpreters was offered by Copenhagen and Aarhus Business Schools which established a one year open university programme in immigrant languages in 1997. The programme aimed at upgrading native speakers of immigrants languages, but only very few classes were realized due to lack of students: When native speakers of an immigrant language can get a job as an interpreter or a translator without any diploma or certification and to the same remuneration as one with a one year diploma, there is obviously no incentive for spending time and money on such a programme.

**Fig. 2:**  
**The number of applicants for Arabic at Danish universities 1997-2007 (only applicants with Arabic as first choice included).**

Kilde: KOT <http://www.tilmeldingssekretariatet.dk/>

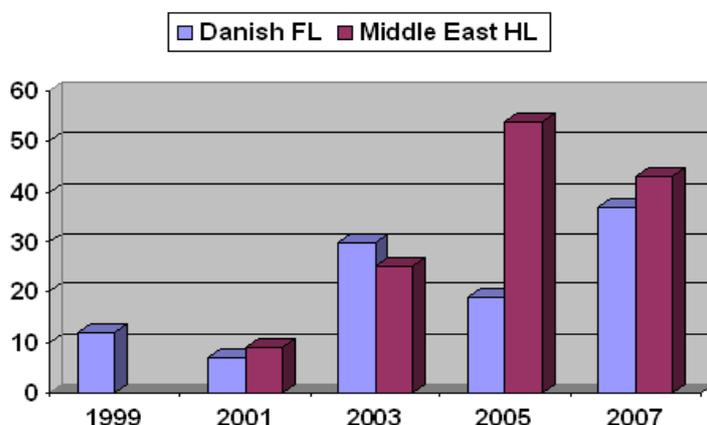

The growth of Arabic at university level can be explained partly by the fact that there has been an increased interest in studying the language from young Arab and Middle Eastern immigrants living in Denmark. In the pedagogical literature, these students are often referred to as heritage learners, meaning “...someone who has had exposure to a non-English (in our context: non-Danish) language outside the formal education system”, or “individuals who appear in the foreign language classroom, who are raised in homes where a non-English (non-Danish) language is spoken, speak or merely understand the heritage learner, and are to some degree bilingual in English (Danish) and the heritage language.” (Valdes, 2001, cited in Hornberger and Wang, 2008: 4).<sup>6</sup> Danish universities do not register students according to race, ethnicity or religion, however, and therefore, not much is known about how many students actually qualify for the term heritage learners. From classroom experience in one of the three Danish Universities which offer Arabic, the number of heritage learners has risen considerably over the last 7 years, as can be seen from fig.3<sup>7</sup>

**Fig. 3:**

<sup>6</sup> For further discussion about the different definitions of heritage language learners, see e.g. Hornberger and Wang, 2008.

<sup>7</sup> Until 2007, this Arabic programme only accepted students every second year.

## Number of applicants for Arabic at the University of Southern Denmark, 1999-2007

Kilde: KOT <http://www.tilmeldingssekretariatet.dk/> and University of Southern Denmark

Based on figure 2 and 3, we may confidently conclude that there is a growing interest in studying Arabic at university level in Denmark and that, at least to some degree, this interest is a reflection of the fact that more Middle Eastern heritage learners are taking an interest in learning or upgrading their language proficiency in Arabic.

### 6. Dilemmas in Danish educational language policy

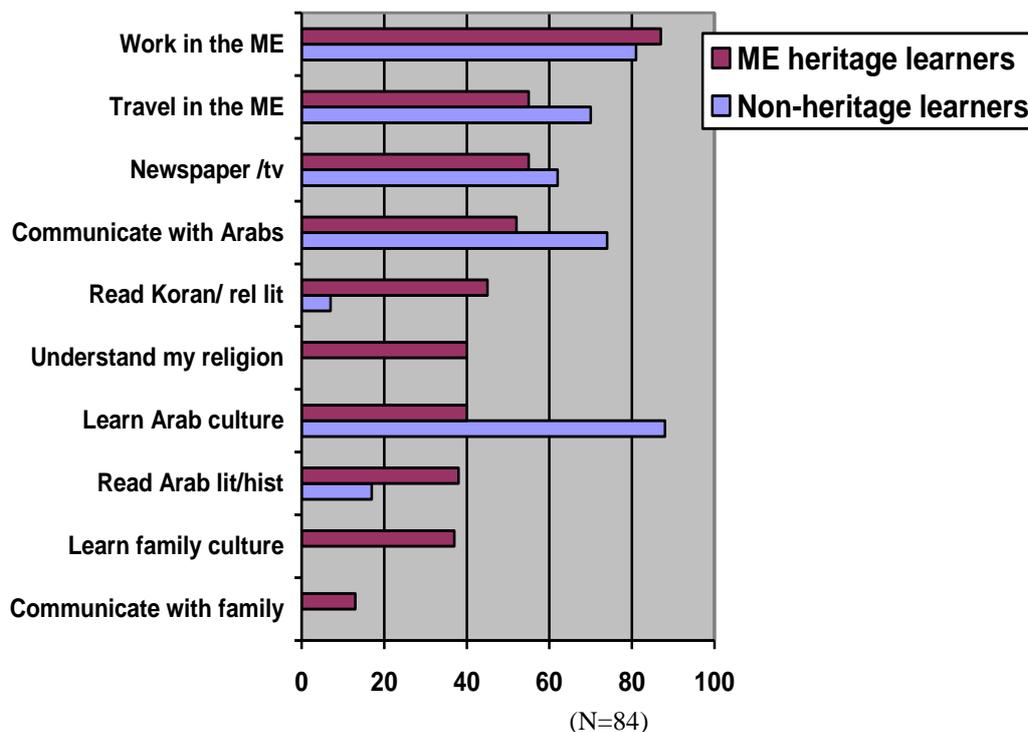

To briefly sum up, the Danish educational sector has experienced an upgrading of Danish in preschool activities and in primary school during the last decade, while at the same time, non-European immigrant languages have been downgraded in primary school to the extent of almost disappearing from the official curriculum. As for secondary school, studying non-European immigrant languages was never an option prior to the reform in 2005, and though Arabic and Turkish are now offered as optional language classes, it seems unlikely that this will have any impact on the situation, at least in the short run, due to structural problems such as lack of teachers and lack of demand for foreign language classes in general. Only at university level do we find language classes of any importance in non-European immigrant languages such as Arabic and Turkish; these languages were institutionalized long before immigration from non-European countries became an issue in Danish society, and this is probably the reason why they have managed, rather easily, to meet the demand for Arabic studies, not least among the growing number of Middle Eastern heritage learners.

But why does a growing number of students, and not least heritage learners, presently choose to study a non-European immigrant language such as Arabic at the university level? Not much is known about this, partly because of the general scarcity of studies dealing with student motivation in the field of Arabic, partly because the growth of students in university studies of Arabic is a fairly new phenomenon, not least in a Danish context. Is it e.g. because heritage learners want to learn more about the language and the culture of their parents? Do heritage learners feel that they can turn their “disadvantage as immigrants into an advantage” in the labour market, as claimed

by some of them? Or is it, as argued by a wellknown Danish History professor, because the heritage learners “want to make a shortcut to an academic degree” (Ø stergaard, 2007)?

In order to shed light on students’ motivations and expectations for studying Arabic, a survey was conducted at the Arabic programme of the University of Southern Denmark in 2007. By means of a questionnaire, which was distributed one week after the beginning of the semester, all first year students were asked, among other things, about their reasons for choosing to study Arabic, what they expect to learn, in what field they want to work after graduation, and how their choice of study was perceived by their family and friends. In an attempt to make at least some of the results comparable to an earlier survey on students of Arabic in the US, we used many of the same questions on student motivation as Belnap (2006)<sup>8</sup>.

**Fig. 4:**  
**First year students’ reasons for studying Arabic at university level (%)**

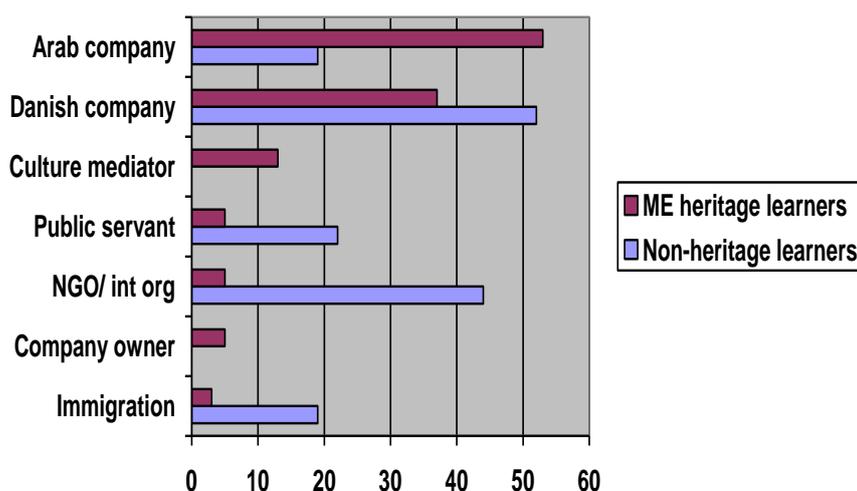

As can be seen from fig. 4, heritage learners and non-heritage learners share a common motivation for studying Arabic: More than 80 % of both groups state that their main objective is to get a job working with the Middle East. As second choices come travelling in the Middle East, getting access to news in Arabic and communicating with Arabs, which attract approximately half of the heritage learners and 50-60% of the non-heritage learners. Religious aspects (reading the Koran and religious literature, understand their religion) and access to Arab heritage (literature, history, culture and

<sup>8</sup> Belnap’s survey, however, does not report much on differences in student motivation between heritage learners and non-heritage learners (Belnap, 2006, 174-175).

family matters) seem to attract mainly heritage learners (around 40%), the only exception being that non-heritage learners are also highly motivated by learning about Arab culture (more than 80%). This seems to suggest that heritage learners' reason for studying Arabic, in Denmark at least, is of the same nature as that of all other students: They want to get a job, preferably related to the Middle East. Heritage-related motivations, such as religion or learning the language and culture of their parents, seem to be of less importance.

What kind of jobs do the students want to get, once they graduate? While heritage and non-heritage learners do not differentiate very much in their wish to use their degree for career-opportunities, there are indeed differences as to where they want to work in the future: As can be seen from fig. 5, non-heritage students opt for a variety of jobs, be it in the public sector, in international organizations, NGO's or in Danish companies. The heritage learners, on the other hand, give priority to the private sector: They want to get a job in an Arab or a Danish company, whereas neither the public sector nor international organizations/ NGO's seem to be of interest to them.

**Fig. 5**  
**First year students' expectations for future jobs (%)**

The survey is based on a rather small sample of students, and one has of course to take care not to overgeneralize the results. With this in mind, it is nevertheless noticeable that students who opt for an education in a non-European immigrant language such as Arabic, do so with the clear expectation of getting a job, be it in the private or the public sector. And this very fact points to at least two dilemmas in Danish educational language policy: First, in a society which upgrades Danish and downgrade non-European immigrant languages in the educational sector, a growing number of young Danes, heritage and non-heritage learners alike, not only want to study a non-European language such as Arabic; they also see their choice as a way into the job market. Thus, there seems to be a contradiction between the policy of the Danish educational sector on non-European immigrant languages and the interests, wishes and aims of heritage and non-heritage learners, which is all the more striking because the Danish welfare state

would eventually benefit from these learners getting access to the labour market in terms of taxation.

And secondly, there seems to be dilemma with regards to globalization: On the one hand, a small and highly globalized welfare state such as the Danish one is very dependant on its interaction with the outside world, be it financially, culturally or for national security, and therefore must give priority to foreign language learning. On the other hand, the welfare state does what ever it can, to downgrade the importance of non-European immigrant languages by creating barriers for education in these languages. This leads to a weird situation where the potential of non-European immigrants to support the globalized economy of the Danish welfare state is not used to its full potential, neither for the immigrants, nor for the welfare state.

# The transcription of personal names: the Japanese passport

Joseph DeChicchis

Kwansei Gakuin University

Sanda-shi Gakuen 2-1, Hyogo-ken 669, Japan

j@kwansei.ac.jp

## Abstract

An important matter of language policy today, affecting thousands of individuals around the world on a daily basis, is the roman transcription of personal names in identity documents. Yet, despite a half-century of effort by the International Civil Aviation Organization (ICAO) to standardize travel documents, state authorities often issue passports with improper and contradictory roman spellings. The modern Japanese passport is notably bad, but such problems face international travellers from Chinese, Arab, and other cultural areas. The documentation and verification of personal names is an important feature of international policing, banking, and general commerce; and linguists must help craft language policy which informs the documentary records of people and their personal names.

**Keywords:** language policy, Japanese passport, names, document standards, roman transcription

## 1. Documentary names

One of the most important matters of language policy today, which immediately affects thousands of individuals around the world on a daily basis, is the roman transcription of personal names in identity documents. Moreover, the current climate of wariness over international terrorism has heightened the scrutiny of identity documents, raising also the risks faced by normal innocent people. Strolling through today's global village invites routine police stops, questionings, and requests for a "photo ID". One's personal name is no longer what one utters in reply to a friendly greeting: "Hi! What's your name?" Instead, personal names have become so many patterns of ink on government documents; and woe be to the person with discrepancies in the documentation of his or her personal name! Yet, despite a pressing need for rational and perspicuous language policy decisions, and despite a half-century of effort by the International Civil Aviation Organization (ICAO) to standardize travel documents, we have a situation which may be aptly termed "unplanned language policy" (cf. Touchstone 1996); in this case, where a state authority issues passports with insufficient regard for the precise manner of name transcription. The resulting frustration and complaints are similar to those described for laissez-faire language policy by Phillipson (2003: 133-137).

In former times, passports were fairly casual travel documents in which a person's name was written as he or she might desire, which is actually a very good policy. After all, if I were to say, "My name is 'Joe'," and you were to say, "Oh, hi Jim," then I would correct your misapprehension of my name by saying something like, "No, my name is 'Joe', not 'Jim'."

### 1. a plausible introduction

- Hello! My name is 'Joe'.
- Oh, hi Jim!
- No, my name is 'Joe', not 'Jim'.

Similarly, as a competent adult, I tell people how to write my name, especially since people often have a hard time with "DeChicchis".

Over the past generation, passport offices have increasingly usurped the responsibility for writing a person's name "properly", with unfortunate consequences for travelers. Such usurpation is done in the name of "uniformation" (cf. Rubin 1977:

171-172), and Japan's passport offices have ostensibly done this in order to better meet Japan's international obligations toward the standardization of travel documents. Officials at Japanese passport offices have become more careful in checking roman transcriptions, and they have become less tolerant of variation, all with an eye toward achieving the goal of a uniform passport transcription policy. Ironically, in part due to these same passport officials, Japan is now replete with stories about the bizarre misspelling of names. By striving for passport uniformity, these officials have actually contributed to the proliferation of discrepancies vis-à-vis other identity documents.

Due to ICAO-led standardization, the passport has come to serve as a proof of personal identity. Therefore, it is particularly surprising to learn that the passport name of a person may not be that person's legal documentary name. This is the area where the discrepancies between countries' documentary traditions and the ICAO's emerging international standards are most glaring. Personal names may be natively written using scripts or diacritics or styles which are eschewed by the international passport standard. The modern Japanese passport is notable, not only because the person's roman script passport name does not match the person's legal Japanese script name, but also because the Japanese government's protocol for romanizing Japanese personal names is often at odds with Japanese cultural tradition, documentary precedent, and the personal desires of the Japanese people. As a result, many Japanese have become accustomed to using a passport with an incorrectly spelled name. The passport spelling may not match the spelling on a credit card; it may not match the spelling on a school diploma; it may not match the spelling on a driver's license.

The official Japanese documentary name of a person is written on a document which constitutes proof of that person's Japanese nationality. The data of the "koseki tohon" (戸籍謄本 "one's family registry record") are written using a limited set of Chinese and Japanese script characters. This koseki system of family registration both records and certifies the official Japanese script name of each Japanese person.<sup>1</sup>

## 2. spelling one's name

- How do you spell your family name?
- D, E, capital C, H, I, C, C, H, I, S.
- Thank you.

田中

健

## 3. official Japanese name as registered and printed on proof of nationality

On the other hand, the official Japanese passport is printed without the Japanese person's official name; instead, in accord with ICAO guidelines, a romanized name is given.

4, Japanese name as written on the Japanese passport

Two questions immediately present themselves. First, how is the roman script name to be decided? The Japanese government has devoted some attention to this question, and government policy is discussed below. Second, when looking upon a Japanese passport, how is an official looking at the passport able to infer the actual Japanese documentary name of that person? Considering the romanization of many common Japanese names yields an appreciation for the relevance of this seemingly abstract policy question. For example, the passport name "Watanabe" can correspond to one of four common family names: 渡部, 渡辺, 渡邊, 渡邊. The passport name "Tachibana" can be 橘 or 立花; and "Sakai" can be 坂井 or 酒井. The Passport Law (法律第二百六十七号) remains underspecified as to the nature of Japanese orthography; however, it does require that the "shimei" 氏名 (i.e., a full documentary name, with both family and given names) be written in the passport. Now, the authority for a Japanese person's shimei is undeniably the "koseki", i.e., the family registry, where the shimei is written without the use of roman characters, and where the shimei is typically written using only kanji. In other words, the official documentary name of a Japanese person, the shimei, is never written in roman and is typically written only in kanji. One immediately wonders why the passports currently issued by Japan do not bear this shimei, as required by law.

Of course, romanizing names for passports does not just affect Japanese people. International travellers from Chinese, Arab, or other cultural areas experience similar choices, and even absurdities. How should Arabic be romanized? Moreover, troublesome transcription problems are not necessarily associated with nonroman scripts, as the Latvian court cases involving the variant spellings of "Mentzen" and "Mencena" made clear. Although Latvia's ultimate court decision on this particular woman's passport name transcription indicates that even a linguistically hard-line government can show sensitivity in language policy making (cf. Republic of Latvia 2001), such sensitivity is still uncommon.

5. Arabic يوسف  
Yusef, Yousef, Yusf, or Joseph?

6. spelling in Latvia  
Mentzen or Mencena?

## 2. Japan's modern personal name

Japan's modern era begins with the Meiji Restoration, shortly after which all Japanese were required to adopt surnames, and these became the inherited family names of today. Thus, the modern Japanese personal name, the seimei 姓名, consists of a family name and a given name, both of which are recorded in the family registry (the koseki 戸籍) maintained for each Japanese person by the appropriate municipality. Such registration constitutes proof of Japanese nationality.

### 7. the Japanese name

**pattern:** seimei 姓名 = myōji 苗字 + namae 名前

**example:** 田中健 = 田中 + 健

**romanized:** Tanaka Ken.

Today, a person's family name may be called a myōji (苗字 or 名字), uji (氏), or sei (姓), although these terms were not synonymous in former times. The given name is called the namae (名前 "name") or, when disambiguating, the shita-no-namae (下の名前). In the family registry, the family name is written in an area separate from the given name, but in other documents the family name and given name are written together and in that order. Technically, for Japanese nationals, there is no space between the family name and given name when written together as one seimei; however, on many official documents, a space or even a punctuation mark can separate the family name from the given name. Thus, a person's documentary name may be printed in several ways.

### 8. common seimei variants

田中健  
田中 健  
田中 健  
田中、健  
田中・健  
田中, 健

A myōji may be written with between one and five kanji, though most family names are written with either two or three kanji. Of the fifty most common Japanese family names, forty-six are written with precisely two kanji. Thus, even when written without an intervening space or punctuation, the boundary between the myōji and the shita-no-namae is normally easily guessed.

The Japanese family registry records the official transcription of the seimei, and only a proper subset of the Japanese script characters are used in this registry's transcription. Moreover, the pronunciations of the names are not explicitly recorded. Consequently, the family registry record cannot differentiate homonymous names, nor can it identify homophonous names.

### 9. script ambiguity

**homonymous** 上野 and 上野  
(i.e., Ueno and Uwano)

**homophonous** 川村 and 河村  
(i.e., Kawamura)

Using the Japanese syllabary, we can easily write the pronunciation of a family name or a given name. For example, my own family name (which is the registered name of Japanese nationals) is written デキキス with syllabic characters. However, most registered Japanese names are written with kanji (i.e., with Chinese logographic characters). Thus, for a typical Japanese person, the family registry affirms the official

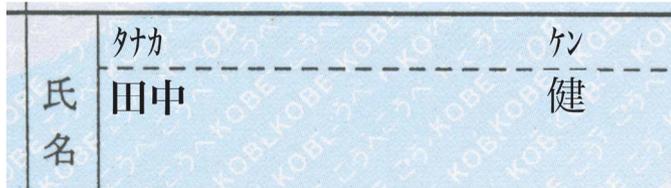

documentary name of that person, in Japanese script, and the name is typically written with logographic characters. The indeterminate nature of such pronunciations is well known.<sup>2</sup> Nevertheless, the pronunciation of such logographic characters is not explicitly written on the koseki tohon and other Japanese family registry documents.

Although it is not written on the koseki documents, the pronunciation of a Japanese person's documentary name is written on other official documents. For example, it is now always written on the document used to register a person's birth. The official pronunciation of a seimei may also be transcribed with the Japanese syllabary in the person's residence certificate, which replicates the data of the jūminhyō 住民票, the address registry maintained by the appropriate municipality. The city of Kobe prints the pronunciation using the Japanese syllabary on the residence certificate; however, the city of Osaka does not.

**10. names registered in syllabic script**

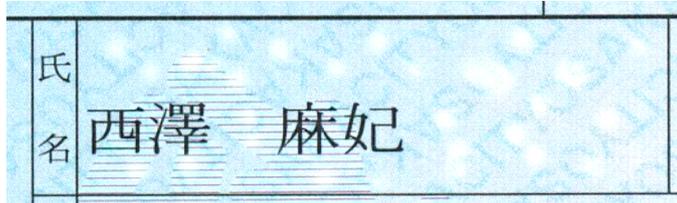

**family name:** デキキス

**given name:** りな

**11. Kobe pattern:**

**The Japanese pronunciation is printed on the residence certificate above the official seimei (jūminhyō 住民票).**

**12. Osaka pattern:**

**No pronunciation is printed on the residence certificate,**

Currently, as seen here, the Kobe residence certificate prints these pronunciations along with the seimei. In Osaka, on the other hand, the pronunciation is not printed. A person's birth registration certificate, or sometimes even a national insurance card, can be used as documentary evidence of a name's pronunciation; however, a Japanese rarely has to document the pronunciation because simply saying the name aloud suffices in most contexts. In the case of passport applications, when documentary proof of a pronunciation cannot be provided, the passport official must be willing to accept the applicant's attested pronunciation.

**3. Japan's romanization schemes**

Neither the family registry nor the residence registry provides for a romanization of a personal name. Thus, in order to comply with ICAO passport standards, it is necessary to romanize the personal name of each person who receives a Japanese passport.

Japan's foreign ministry has thus been entrusted with the task of romanizing the seimei of any Japanese who desires a passport.

Japanese language has been romanized in various ways over the years, but the most common romanization schemes used today are all either a Hepburn version or a variant of the Nihon-shiki. Varieties of the Hepburn romanization scheme have been used since 1885, although no Hepburn system is currently the legal standard of Japan. Since 1954, the legal standard for romanization has been a variant of the Nihon-shiki known as the Kunreisiki, which was the basis for the international standard ISO 3602. Figure 13 shows how some Japanese names might be romanized under different systems.

### 13. variant romanizations

大谷	Ohtani, Ôtani, Ootani, Outani, Otani
中島	Nakajima, Nakazima
藤原	Fujiwara, Huziwara, Fudziwara
梅治	Meiji, Meidi, Meizi

A Cabinet Order of 1954 (内閣告示第一号) standardized the romanization, resulting in the so-called Kunreisiki system. However, the wording of this order was vague enough to allow for continuing discrepancies. In particular, exceptions listed in "Table Two" were intended to accommodate the most common Hepburn transcription practices. Figure 14 gives the three rules of the 1954 Order.

### 14. government romanization rules

- (1) In order to transcribe Japanese into roman characters, you must follow Table One.
- (2) If, due to international relations or convention or such, you are unable to follow Table One, then Table Two may be in order.
- (3) In any case, the notes below must generally be applied.

To compensate for such vagueness, one would expect that the administrative protocols for transcription be well specified. How are the tables to be read? Precisely when should Table Two be used? Who is authorized to answer these questions? However, as is often the case in Japan, a consistent protocol for resolving transcriptions according to these 1954 guidelines has not been published.

As can be seen in the passports issued by the various passport offices of the Foreign Ministry, passport names generally violate the 1954 law. To take two simple examples, Japanese passports have been issued which vary on the spelling of し as either SHI or SI, and on ち as either TI or CHI.

### 15. Table One and Table Two conflicts

し should be romanized as:  
(re Table One) SI  
(re Table Two) SHI  
ち should be romanized as:  
(re Table One) TI  
(re Table Two) CHI

Passports have also been issued which vary on the use of R~L and N~M, even though the 1954 Order is clear that L and syllabic M should not be used. According to the Notes of the Order, ん should always be written as N, and both Table One and Table Two require writing れ as RE (never as LE). Some representative variants are listed in Figure 16.

### 16. authorized and unauthorized romanizations

pronunciation in hiragana	authorized by Table One	authorized by Table Two	unauthorized romanization
しまの	Simano	Shimano	
みちえ	Mitie	Michie	
じゅんぺい	Zyunpei	Junpei	Jumpei
れお	Reo	Reo	Leo

In defense of their deviation from the Kunreisiki standard, passport officials routinely state that they are adhering to Hepburn rules for romanization; however, they do not specify which version of Hepburn they follow. The traditional Hepburn system sometimes transcribes ん as M, whereas later versions always use N (often with a diacritic, such as an apostrophe or macron). In any event, to explicitly claim to follow Hepburn rules is still a violation of the 1954 Cabinet Order which mandates Kunreisiki. Moreover, no version of the Hepburn transcription permits writing LE for れ, yet such a spelling can be used on a Japanese passport, and Japanese passports have indeed been issued which spell names with L.

#### 4. The problem: no protocol, case-by-case variation, local passport office caprice

In short, there is no published protocol for uniquely transcribing Japanese names into roman letters, and examination of official practice reveals that transcriptions actually vary on a case-by-case basis. Currently, at Japanese Passport Offices, the reality of

Japan's transcription protocol is simply this: An applicant for a Japanese passport is browbeaten to transcribe the pronunciation of the seimei in conformity with Table Two of the 1954 Cabinet Order, unless the applicant can show good reason to do otherwise. Passport officials may also insist on transcriptions which violate the Notes of the 1954 Cabinet Order (e.g., syllabic M instead of N). In general, in completing the application form, whenever an applicant for a passport provides a roman transcription which a passport official does not like, the transcription is routinely changed, and a passport is issued in the "acceptable" spelling; the applicant can either take it or leave it.

Thus, the modern Japanese adult who travels abroad now receives a third transcription of his seimei. Besides the seimei as traditionally written with kanji in the koseki, and besides the official pronunciation of the seimei as written with the Japanese syllabary on the birth certificate and elsewhere, there is now the romanized seimei as written in the Japanese passport.

## 5. The case of Genmoto~Gemmoto

Japan's passport authorities and their romanization insensitivity have been a source of trouble for many people. The case of the Genmoto げんもと family is illustrative. The traditional Hepburn transcription occasionally uses M to transcribe the syllabic ん, but later versions of Hepburn (e.g., the Library of Congress version) do not use M in this way. Under Japanese law (e.g., the 1954 Order), this name should be transcribed as GENMOTO, and it is so transcribed on the credit cards and important civic and commercial documents of one Genmoto family. Yet, in the case of this family, the passport office has insisted on spelling their name GEMMOTO. The spelling GEMMOTO explicitly contradicts the 1954 law, which specifies that the syllabic ん must always be transcribed with N.

17. Genmoto~Gemmoto	
<b>pronunciation in hiragana:</b>	げんもと
<b>VISA card romanization:</b>	GENMOTO
<b>passport romanization:</b>	GEMMOTO
<b>air ticket romanization:</b>	??????????

Since 2001, heightened scrutiny of documents at airports has been troublesome for the Genmoto family. If an e-ticket is issued in the name GENMOTO, then it will match the name on the purchasing credit card; however, it will not match the name on the passport. Alternatively, using the passport spelling makes it difficult to purchase a ticket. Despite pleas from the Genmoto family, the Japanese passport officials have refused to issue a passport with the desired spelling of GENMOTO, even though this is the spelling which has been official since 1954. As one member of the Genmoto family puts it: "I have spelled my name both Genmoto and Gemmoto. For Japanese friends and when I am in Japan, I use 'Genmoto', and for friends outside of Japan and when I go abroad, I use 'Gemmoto'. This is because of my passport."<sup>3</sup> Of course, the Genmoto

family would like to use a uniform roman spelling of their name, but the Japanese passport authorities have made this impossible.

In 1954, Japan showed promise for implementing rational language policy when it reaffirmed its pre-war decision on Japanese romanization; however, today, Japanese policy in this area remains inchoate. Romanization is important in Japan because of its widespread use in banking and commerce. In addition, the roman transliteration and transcription of Japanese names is widespread outside Japan, especially in the Americas and Oceania, and the reconciliation of alternate spellings of family names across international boundaries is an issue of Japanese concern. For other reasons as well, Japan has long recognized the need for a sensible romanization policy, but it has simply failed at implementation.

To appreciate the extent of this failure, it is enough to note that Japan's current passport law contradicts an earlier cabinet order. Moreover, Japan's passport law, in spite of Japan's ICAO membership and participation, also fails to comply with the ISO standard and with the ICAO's own guidelines for passport name transcription. After all, the 1954 Kunrei romanization system is the ISO standard, and it is cited in the ICAO passport guidelines as the proper way to romanize Japanese. Clearly, Japan's passport offices are not only failing to serve their own people, but they are also failing to meet their obligations under international agreements.

## **6. Government awareness of the problem**

Passport officials are aware of the problems which name transcription currently creates. The biggest single problem is that a person's official Japanese script name does not appear anywhere on the modern Japanese passport. Towards rectifying this problem, and as a way of also bridging the gulf between disparate spellings, passport officials now encourage Japanese citizens to sign their passport using the Japanese script in block style.

Unfortunately, many Japanese have cultivated cursive signatures in both Japanese and roman scripts. Given that their passport signatures may be used as an identifying feature in their foreign commerce, they are reluctant to sign a passport in block letters, and they often prefer to use a roman script signature.

International experience often prompts a Japanese person to develop a cursive roman signature. Here is an example of the cursive roman signature commonly used by one Japanese man:

## **18. Cursive roman script signature**

Of course, before developing his roman signature, he had also developed a cursive way of writing his name in Japanese, for both vertical and horizontal directions. For example, upon receiving certain letters or parcels, he commonly would write his "shomei" 署名 in Japanese script as a mark of such receipt. When writing his Japanese shomei, (i.e., his Japanese signature), from left to right, it looks like this:

A cursive Japanese signature written horizontally from left to right. The characters are highly stylized and connected, typical of a personal signature.

### 19. Cursive Japanese script signature

However, this same man, when writing in the block style suggested by the passport office, writes his name this way:

The same name written in a block-style Japanese script. The characters are more distinct and less connected than in the cursive version, but still written horizontally.

### 20. Name written in block-style Japanese

Clearly, the block style suggested by the passport office is the least personal of the three. Moreover, it can not serve as a basis of signature comparison for identification purposes.

## 7. An easy solution

In general, Japanese language policy in this area requires four things:

- (1) There should be uniform government compliance with the 1954 government romanization rules. These rules are not perfect, but they are fairly clear, and government officials should generally not violate them. Moreover, the 1954 rules have been taught to Japanese school children for over a generation, they are institutionalized in various areas of commerce, and they are well accepted by the general public.
- (2) With respect to the transcription of a personal name, any deviation from the 1954 rules should be made in accordance with the desires of the person affected. A passport official should not presume to tell Japanese citizens how to spell their own names.
- (3) A passport name spelling should be amended whenever this is so desired by the person affected. Just as a foreigner living in Japan can change his or her official pseudonym (i.e., the *tsūshōmei* 通称名, which is registered in the municipal registry) at will, a Japanese citizen should be accorded a similar courtesy vis-à-vis the spelling of his or her passport name.

(4) Without violating ICAO specifications, the format of the Japanese passport should be revised to incorporate the Japanese script seimei of the passport holder, and the seimei should be printed in a standard style.

## 8. Linguistic expertise must inform government policy

The actual adoption of any reformulation of Japan's passport name policy would naturally be a governmental decision. Nevertheless, the precise articulation and the rational evaluation of such policy is the proper concern of "language policy" as an object of linguistic attention. Expert linguistic opinion is particularly important in technical issues which lack enough popular interest to make the political agenda, for absence from the agenda does not diminish the importance of an issue. The documentation and verification of personal names is an undeniably important feature of international policing, banking, and general commerce; and linguists have a duty to inform governments and other entities which manage the documentary records of people and their personal names. Despite today's focus on Japan, the issues raised here have global ramifications, not in an abstract academic way, but immediately for real people trying to live their normal lives.<sup>4</sup>

## 9. Notes

1. The graphic depictions of documentary name tokens herein are not exact replicas of actual personal documents. Rather, they are good simulations which preserve the important graphic features of those Japanese documents.
2. Often the indeterminacy involves a trivial morphophonemic variation, such as the pronunciation of を書宮川 as either みやかかわ (Miyakawa) or みやがわ (Miyagawa). In many cases, however, the difference is quite significant, such as the pronunciation of 角田 as either かくた (Kakuta) or つのだ (Tsunoda).
3. Mrs. Genmoto, personal communication.
4. I am grateful to Yasushi Miyazaki, Bouzid Omri, Maki Nishizawa, Miyako Kawano, and others for their help with various parts of this paper. Any errors of fact or interpretation are attributable solely to myself.

# Empowering African languages: Focus on Tanzania and Namibia

Karsten Legère  
University of Gothenburg  
Box 200  
SE-405 30 Göteborg  
[karsten.legere@african.gu.se](mailto:karsten.legere@african.gu.se)

## Abstract

The language policy of Tanzania (endoglossic) and Namibia (exoglossic) is referred to with reference to the empowerment of African languages. Tanzania's gradual stipulation of the national language Swahili as the co-official language (alongside English) is contrasted with the imposition of the foreign language English in Namibia as official language. In addition, the paper deals with those national languages that are excluded from official and other formal domains in Tanzania, but tolerated and used in Namibia in education, the media and elsewhere. The language policy of both countries is designed to guarantee the prominent role and use of the official languages, while little or no attention is paid to the rich linguistic heritage reflected in the existence of many other languages.

**Keywords:** Language policy of Tanzania and Namibia, empowerment of Swahili and other national languages, official languages, language status, language use.

## 1. Introduction

The objective of this paper is to review language policy issues with particular reference to the empowerment of national languages in two selected African countries, i. e. Tanzania and Namibia. The former country has been known for its endoglossic approach to the linguistic situation. Namibia is an example of an exoglossic language policy which has been pursued since independence in 1990.<sup>1</sup>

The Tanzanian example has frequently been discussed in publications. Accordingly, the question arises - why is Tanzania's language policy taken up again here within the limited context of this conference contribution? The answer is quite simple - the way the country's language policy is portrayed is deficient in one way or another. Thus, the Swahili language is said to have become the official language of the country at a certain point in time authors referring to 1961, 1962, 1964 and 1967 respectively; while up to date any decision of this kind by Tanzanian authorities is still pending.<sup>2</sup> Or, in this connection another tendency is to speak of Swahili as being declared the Tanzanian national language.<sup>3</sup>

---

<sup>1</sup> *Endoglossic* and *exoglossic* are terms that became popular in describing language policy positions and implementations in the 1970ies mainly as the result of the thorough discussion of sub-Saharan issues by Heine (1979), see for a current reference Wolff (2000: 342).

<sup>2</sup> See Tanzania (1997: 15) which states that Swahili has not yet been declared the official language of Tanzania (“..bado Kiswahili hakijatamkwa kisheria kuwa ni Lugha Rasmi ya Taifa”).

<sup>3</sup> Comp. i.a. Bamgbose (1991: 121) - “... declaration of Swahili as the national language...” (see also *ibid.*; 32), which obviously refers to its official status as well as to the fact that this (and other “national”

In the case of Namibia, the country's language policy after 1990 enjoyed international attention in early years of post-independence development. In those days, scholars and experts were still hoping that Namibia would have learnt from other African countries and their thorny way of spreading and using the ex-colonial language. However, in so doing the overwhelming majority of Africans was in fact excluded from any active role in the process of nation-building for lack of understanding the official language. Hence, after some years of watching the Namibian experiment of virtually imposing English as a 'no (wo)man's' language, this initial attention faded away. Namibia and her language policy do no longer occupy a favourite position in language policy papers pertaining to Africa, where the focus in the South has shifted to South Africa. Nonetheless, as an example of how an exoglossic policy struggles to spread a foreign language Namibia can still well be taken into account.

## 2. Linguistic situation

Both Tanzania (population 40,213,160) and Namibia (2,088,669 people)<sup>4</sup> are linguistically complex countries. The numbers of languages and language varieties spoken in each country are impressive, even if one takes it for granted that neighbouring "languages" (represented by divergent glossonyms/autonyms) are frequently mutually intelligible language varieties (dialects), thus representing a dialect continuum. Without taking this fact appropriately into account "Ethnologue" (Gordon 2005) claims for Tanzania:

The number of languages listed for Tanzania is 128. Of those, 127 are living languages and 1 is extinct.

The Languages of Tanzania (LoT) project<sup>5</sup> which in 2006/7 carried out a country-wide survey to record the distribution of all languages (national and those of foreign origin) came up with a list of approx. 150 glossonyms. Accordingly, the divergence "Ethnologue" - LoT demonstrates the need for further studies to properly account for the language - dialect dichotomy that is also characteristic of most other African countries.

Swahili is the national language of Tanzania on account of its nation-wide distribution as well as its strong social basis<sup>6</sup> in particular as second language for most adult Tanzanians.<sup>7</sup> English enjoys the status of an official language. Although people

---

languages) have their origin in Africa. For a substantial discussion of the term "national language" that includes also this reference to the official status of a particular language see Brann (1995).

<sup>4</sup> Estimates for 2008, source: CIA (2008).

<sup>5</sup> LoT is a Swedish funded research cooperation project that is based at the University of Dar es Salaam, Tanzania, Department of Foreign Languages and Linguistics and the African languages section (University of Gothenburg, Sweden).

<sup>6</sup> Hence, it has not to be declared the national language. Nor are Swedish or German declared the national language of Sweden or Germany and Austria respectively. Such a declaration would be redundant and has never been made. A national language, of course, exists without any formal recognition - terminological vagueness like e.g. portrayed by Bamgbose (see above), or, more general, Wolff (2000), is often typical in this connection.

<sup>7</sup> Probably more than 90 percent of the adults are competent speakers of this language (in fact, to a large extent speaking Swahili as their first language, while mother tongue competence is eroding and lower, the latter being in the process of been given up or less frequently used than Swahili). Children in urban areas mostly acquire Swahili as their mother tongue regardless of the ethnic origin of their parents. In ethnically

speaking English could be found all over the country, its social basis is weak. It is indeed a foreign language despite many years of being taught in school.

For Namibia Gordon (2005) presents the following summary:

The number of languages listed for Namibia is 28. Of those, all are living languages.

Again, the language - dialect problem plays a major role, even with regard to political issues. As a matter of fact, glossonyms like Kwanyama, Ndonga and those of other members of what has earlier been classified as “Ambo cluster” (currently referred to as *Oshiwambo* in Namibia) create the impression of denoting languages of their own. But they are all mutually intelligible constituting approx. 50 percent of languages spoken in Namibia. People, however, resisted and continue to resist any harmonization endeavour on ground of claiming to lose their linguistic and ethnic identity, as soon as measures which aim at overcoming dialect boundaries by creating standard varieties are even discussed.<sup>8</sup>

Initial colonial domination (and after World War I) foreign rule made the linguistic situation even more complex. Thus, with German the colonial rulers imposed a foreign language that was prescribed as being official in important formal domains (in particular the official domains legislation, administration, and judiciary). The Mandate/Trusteeship administration (South West Africa/Namibia was handed over to South Africa, German East Africa - renamed as Tanganyika - was ruled by Great Britain) made English and in Namibia in addition Afrikaans the official languages. These official languages enjoyed a high status, while national languages<sup>9</sup> were rather neglected. Only in Tanganyika British rulers found Swahili to be of some value in order for facilitating the communication of officials with Tanganyikans within the limited framework of primary education, local administration, manpower recruitment, legal matters, taxes or health care.

When South Africa implemented with the Odendaal plan in her Trusteeship country Namibia Apartheid by creating Bantustan-like structures, languages of each so-called self governing territory were made official alongside Afrikaans and English. However, the *de facto* official language of Namibia before independence 1990 was Afrikaans.

It goes without saying that the complex linguistic situation both in Namibia and Tanzania raises many questions which basically boil down to one issue - how to deal with this situation taking into account that there are

---

(and hence linguistically) homogeneous rural areas up-country the language of the dominant ethnic community /henceforth called L1) is still the favourite medium of communication which is even acquired by the young generation. Accordingly, approx. 50 percent of rural children are supposed to be not competent in Swahili when they start schooling (author's estimate based on his experience and field work in various regions of the country).

<sup>8</sup> See the summary of a cross-border language workshop and its recommendations in Legère (1998). Until 1994 there was a Language Committee which monitored the development of both Kwanyama and Ndonga, but was split up in September 1994 into the Oshikwanyama Curriculum Committee and the Oshindonga Curriculum Committee. The aim was to further promote both varieties as media of instruction and subjects in school, just ignoring the well known fact that ‘unity is strength’ (much needed to survive in view of the omnipresent position of the official language English).

<sup>9</sup> This term is used here in analogy to other African countries (e.g. Benin, Ethiopia, Central African Republic, Cameroon - for the latter case see Rosendal 2008) to denote heritage languages that are not of foreign origin, but have emerged and being spoken in sub-Saharan Africa since time immemorial (for the use of this term in Africa see Brann 1995).

- those languages which are media of wider communication across ethnic and linguistic boundaries,
- large numbers of languages which are in-bound and not spoken outside the area where the speech community lives, and further
- small and heavily endangered as well as moribund languages?

It is just logical to assume that either every language is left alone to grow or to die, or, as an alternative, that some planned interference takes place addressing relevant variables, some of which are sketched above. In this respect, language policy has an important role to play.

According to Calvet (1986: 20), language policy (*politique linguistique*) is the totality of conscious choices made with regard to the relations between language and social life. From a more comprehensive perspective, the following aspects of what language policy is, were discussed in Legère (1995: 71-72):

Language policy is ... part of the political concept which deals with the linguistic situation in a given country and its intended change along the lines perceived by political or social groups and parties. It is the politically motivated attitude towards a language/languages, in particular its/their role and use in domains which are directly or indirectly controlled by these aforementioned entities. ... a language policy may be formulated by groups of different social or political profile, while its implementation is mostly confined to the ruling class which controls the State and its institutions. Nonetheless, even circles which are not in power may pursue their language policy and its implementation within domains which are either beyond the control of the State or there where the latter is not much interested.

The language policy of a given country may be expressed in policy statements by ruling circles as well as by the opposition or other groups, and may be subsequently entrenched in the Constitution or other legal documents.

... any language policy is embedded in the political credo of the given entity. Thus, the language policy of countries which temporarily followed the ideal of a socialist orientation such as Ethiopia or Tanzania demonstrated much more the will of the Government to actively promote the dialogue with the population by enhancing the use of languages widely spoken or understood by the latter, while traditionally pro-Western regimes like Ivory Coast or Kenya focused on French or English unless the Western-educated and oriented political leadership needed the support of the masses where African languages were used.

For sub-Saharan Africa e. g. Bamgbose (1991) has extensively contributed to the language policy discussion. In particular his final chapter deals in detail with language policies and language planning in African countries as well as the OAU Plan of Action for African Languages.

The author is fully aware of other approaches regarding the understanding of language policy and its role. Within the constraints of this paper reference is made to Spolsky (2008) who summarizes well the on-going discussion on this issue. Spolsky (2004), Ricento (2006) and others provide solid examples of language policy matters both from a theoretical and practical perspective.

### 3. The formulation of a language policy and its implementation

The following part summarizes some historical aspects of how a language policy was formulated and subsequently implemented in both countries taking into account the focus and priorities of addressing the linguistic situation.

#### 3.1 Tanzania

For many years there has been a strong support for Swahili in Tanzania as a landmark which is peculiar for this East African country. This support dates back to the years before independence (Tanganyika 1961, Zanzibar 1963). In those days, the political party Tanganyika African National Union (TANU) which took power in 1961 paid particular attention to Swahili. As early as 1954 the then Founding Party Congress included this language in its resolutions with regard to stipulating the language's official status alongside English in the Legislative Council (as well as its role as medium of instruction in school, see TANU 1954: 3). During the independence struggle Swahili was almost exclusively used by the TANU President Nyerere and other leaders as the medium of communication for mobilising the population and explaining TANU policy. This preference of Swahili that took the language's wide spread into account was corroborated in political speeches, statements by party officials and in documents (e.g. at the 1958 TANU Congress which is said to have endorsed Swahili to become the official language after independence).

The political leaders of independent Tanganyika and Zanzibar (and subsequently Tanzania) have been promoting Swahili in many ways thus setting an example for sub-Saharan Africa. The then presidents J. K. Nyerere and Sheikh Abeid Amani Karume, Prime-Minister/Vice-President Rashidi Kawawa and others time and again stressed the role of Swahili as a unifying factor both in Mainland Tanzania and the islands Zanzibar/Pemba.<sup>10</sup> Thus, Nyerere (1965a: ii) stated that "*Kiswahili ni lugha ya Taifa Tanzania*" (Swahili is the language of the Tanzanian nation), but also "*Kiswahili ni moja katika lugha mbili za Taifa*" (Nyerere 1966: v, Swahili is one of the two languages of the nation).<sup>11</sup> The then Second Vice-President Rashidi Kawawa (1970: 4) spoke of Swahili as the "language for all our politics and for almost all our administration".

The years after independence evidenced the far-reaching empowerment of Swahili. Swahili was introduced step by step as official language into formal - in particular official - domains<sup>12</sup> that were a stronghold of English. The latter language was taken over as the official language from the previous dispensation.

Some decisions by Tanganyikan/Tanzanian authorities in favour of Swahili were subsequently interpreted by authors as the year or date which marks the declaration of Swahili as the official language of the country. Very recently, for instance, Maral-Hanak (2008, 116) stated that in the year 1967 Swahili became the official language of

---

<sup>10</sup> 21 January 1964 the then People's Republic of Zanzibar and Pemba made Swahili the official language (this decision was announced only a few days after the overthrow of the Sultan's regime). Zanzibar and Mainland Tanganyika formed a Union in April 1964 with the new name Tanzania.

<sup>11</sup> Clearly referring to its role in formal communication alongside English. More about Nyerere's role in the empowerment of Swahili see Legère (2006).

<sup>12</sup> "Official domains" means here National Assembly/Parliament (legislative), Government and administration (executive) and law courts and law-enforcing institutions (judiciary).

the government. This statement is not further corroborated.<sup>13</sup> The year 1967 seems plausible, since that year coincides with the Arusha Declaration, the then focus on a pro-socialist orientation and fundamental changes in the political development of Tanzania where grassroots mobilization in a language known by the overwhelming majority - and this was clearly Swahili - was a declared goal. Nevertheless, any interpretation which relates the year 1967 with Swahili becoming the official language of Tanzania is not correct, as it neglects the process character of the development and earlier decisions (e.g. in 1964).<sup>14</sup>

The quote initially (in footnote 2) which comes from the quite recent Culture Policy document (Tanzania 1997) makes clear that Swahili has not yet been stipulated as Tanzania's official language. Nevertheless, in practice it has been enjoying this status alongside English for many years. Under the leadership of JK Nyerere the Tanzanian government has appropriately entrenched and consolidated the use of Swahili in particular in the legislative, executive, and judiciary. This language was taken care of in legal documents, such as the constitution, laws, directives, proceedings, etc.

Here are some milestones that demonstrate the officialisation of Swahili:

- 1962 - Report of the Swahili Commission (Chairman Amri Abedi), subsequently Prime Minister Kawawa directs Ministers and civil servants to speak Swahili in public;
- 1962 - President Nyerere addresses the National Assembly in Swahili;
- 1962 - Swahili examination for civil servants;
- 1963 - The Speaker of the National Assembly authorizes MPs to use Swahili in the proceedings;
- 1964 - Kawawa reiterates his directive about Swahili use in administration and parastatals;
- 1967 - Kawawa directs the exclusive use of Swahili in government offices;
- 1972 - Correspondence with Ministries has to be exclusively in Swahili, mail in a language other than Swahili to be returned to sender or remaining unanswered;
- 1974 - Staff Circular 1 directs the far-reaching use of Swahili for
  - all ministerial correspondence;
  - all communication in offices;
  - all office names (Ministries, etc.);
  - all forms.<sup>15</sup>
- 1997 - The Cultural Policy document pays attention to the role and importance of Swahili as well as of L1s, proposing various steps that aim at documenting and promoting these languages.

It should be further noted that various laws and by-laws mark the formal introduction of Swahili in a particular official domain. This is meticulously listed by Bakilana (2004) who refers i. a. to the Marriage Law (1971) being the first legal document translated into Swahili, the Local Authorities (Elections) Act (1979), the Primary Courts Act

---

<sup>13</sup> There is a certain automatism in this statement which is replicated from another source in the sense that its relevance is not scrutinized, but taken for granted.

<sup>14</sup> For details see Legère (1981).

<sup>15</sup> In the late seventies and the eighties of the 20th century no further substantial changes in support of Swahili were made. That's why TUKI (1985) praised the early enthusiasm of the post-independence period but was critical about subsequent stagnation.

(1984), and, of course, to the Tanzanian Constitution which is exclusively written in Swahili (and then translated into English) and the Standing Rules of the National Assembly.

The initiatives summarized above had a far-reaching impact on the position of Swahili in official domains. This language replaced English in the National Assembly, in ministries and other government offices of the central or regional level and as language of the law courts and law enforcing institutions.

Furthermore, the preference Swahili was given in official domains is also mirrored in further legislation which stipulates the use of Swahili (next to English) in other formal domains, such as education (expanding its use as medium of instruction throughout primary education), mass media, trade and commerce, economy etc. In 1969, the Ministry of Education announced in the Second Development Plan (1969-1974) that by 1974 Swahili would be the language of instruction in secondary schools.<sup>16</sup> This objective was, however, subsequently dropped.<sup>17</sup> Another attempt was made in 1984 with one of the recommendations of the Kuhanga Commission that was never implemented, obviously under pressure from institutions in UK. Since then no viable government initiative to address this issue was made.

So far nothing has been said about L1s which are an integral part of the Tanzanian nation. For many years of the post-independence period until the early 1990ies these languages spoken by substantial parts of the Tanzanian population in rural areas of Mainland Tanzania were stigmatized in public and branded as a symbol of tribalism undermining national unity.<sup>18</sup> This position which contradicts linguistic human rights that are i. a. encapsulated in the Universal Declaration of Human Rights and other international documents was formally revised in the 1997 Cultural Policy document (Tanzania 1997) where a special part of the publication is dedicated to the as called therein “community languages” (*lugha za jamii*).<sup>19</sup> This policy document emphasises with regard to the L1s:

- L1s represent sources of history, customs, traditions, (traditional) technology and culture in total.
- people will continue using L1 and being proud of them.

As a consequence, the following issues should be addressed:

- People and parastatal as well as private institutions are encouraged to write in, collect material for, study and protect L1s, and to translate from these languages into others, and
- the production of dictionaries (glossaries) and grammatical descriptions (*vitabu vya sarufi*) is encouraged.
- Institutions and individuals are encouraged to edit/publish texts in L1s.

---

<sup>16</sup> “Serikali imekata shauri kuwa baadaye Kiswahili kitatumika kufundishia masomo ya Sekondari” (Tanzania 1969: 13).

<sup>17</sup> Insiders blamed Nyerere for being against this step. In fact, he stated in 1974 that the further expansion of Swahili’s role in education would be the death blow for English.

<sup>18</sup> Wrote JK Nyerere: “Making Kiswahili Tanzania’s language helped us greatly in the battle against tribalism. If every Tanzanian had stuck to using his tribal language or if we had tried to make English the official language of Tanzania, I am pretty sure that we would not have created the national unity we currently enjoy ... [W]e have ... an enormous duty to continue to promote and enhance Kiswahili. It is a great weapon for our country’s unity” (quoted in Laitin 1992: 91–92).

<sup>19</sup> This is tautology, as there is no language without its speech community.

Mainly for budget constraints, but probably also for lack of political will, the implementation of this policy document is not making progress. No L1 is accepted in official domains or in state-controlled formal domains, as stated May 2006 by the then Minister of Information, Culture and Sports, Muhamed Seif Khatib, during the launch of LoT publications. Even private initiatives to run e.g. a radio station which broadcasts programmes in L1s would not be allowed.

In recent years the official bilingual policy with its focus on Swahili is under pressure. Obviously some influential parts of the Tanzanian bureaucracy pledge for a stronger position of English in official domains. Attempts to promote English in various institutions as a result of the current *laissez-faire* policy are recorded.<sup>20</sup> A clear token of this policy is the lack of initiatives for consolidating and improving the role of Swahili in education, where the language has been blamed for falling standards of education, while government indeed fails to properly run primary and secondary schools. However, whether or not Swahili is appropriately supported, its status as the Tanzanian national language that is used in most formal domains all over the country is unquestionable.

### 3.2 Namibia

Language policy issues were in particular sensitive prior to independence, the reason being the strong segregation function that ethnic and linguistic factors were assigned to play in the then Apartheid strategy of the South African administration. In view of this fact, the leading liberation movement SWAPO pledged in exile for English that was claimed to be a neutral choice and even called “language of liberation”. The political orientation towards the promotion of this language with a strong colonial past went along with the rejection of Afrikaans (the then *lingua franca* of South West Africa, but also spoken by an important non-White Namibian community, the Basters). This approach was further corroborated during the 1980 conference on language policy in free Namibia held in Lusaka/Zambia at the United Nations Institute for Namibia (UNIN). During the meeting the pro’s and con’s of all languages spoken in Namibia were (partly subjectively) rated.<sup>21</sup>

A language symposium held in Windhoek/Namibia in August 1989 brought together SWAPO representatives and those of other political parties in Namibia. All made statements about how they would like to address the linguistic situation summarizing their attitudes towards languages in Namibia. In a nutshell, the SWAPO position was as follows:

- English will be selected as the future official language;
- Afrikaans was to be relegated from an official language to the same level all other non-official languages were supposed to share;
- National languages (L1s) were promised adequate development; their status as media of instruction for lower primary grades was reconfirmed.

It is not incidental that in the same year the SWAPO Election Manifesto (SWAPO 1989: 9) which dealt in detail with language policy, gave the following summary:

---

<sup>20</sup> English was in particular praised, promoted and supported by the then Minister of Education, Joseph Mungai, who in 2001 is said to have called Swahili being underdeveloped.

<sup>21</sup> See UNIN (1981).

The Namibian nation is made up of cultural and linguistic heritage of its various groups. Democratic Namibia will be enriched by all which is healthy in this heritage. A SWAPO government will therefore pursue a language policy that accords equal status and respect to all locally spoken languages. The new policy will redress the present injustice whereby the German and South African colonial states have placed emphasis on the teaching, development and use of German and Afrikaans at the expense of all other local languages, such as, Damara/Nama, Kuangari, Otjiherero, Oshiwambo, Silozi, etc., will be improved to a satisfactory standard.

Mother language will be used as the medium of instruction at the lower primary school level. The concern here is not with so-called group identity or ethnic consciousness and exclusivity, as has been the case with the apartheid colonial regime, but with the fulfilment of cognitive and communicative functions. Since it is through the mother languages that infants first acquire social habits, manners, feelings, tastes, skills and other cultural norms, it is important that their formal schooling starts with those languages of everyday life at home.

At the higher primary school level, English, which SWAPO proposes to make the official language for independent Namibia, will be introduced as a compulsory subject. English will then be used through the secondary level to higher education as the medium of instruction. This policy objective is based on the realisation that none of the locally spoken languages, Afrikaans included, is a medium of international communication; and that in this day and age of increased interdependence among nations, parochial outlook does not serve the interests of any nation. Also, to improve Namibian people's quality of life requires that our country adopts, as a practical sovereign right, all language that will help our people to speedily acquire the vital scientific knowledge and technological know-how. English is one such language.

The independence constitution of 1990 (Namibia 1990) reflects the SWAPO/UNIN position. The document stipulates in article 3.1:

English is the official language of the Republic of Namibia.

But it goes on in sub-article 3.3:

Nothing contained in Sub-Article (1) hereof shall preclude legislation by Parliament which permits the use of a language other than English for legislative, administrative and judicial purposes in regions or areas where such other language or languages are spoken by a substantial component of the population (Namibia 1990:3).

The Namibia Institute for Democracy (NiD 2000:3) interprets this article 3 in the sense that "Government officials and courts may also use other languages where that language is spoken and understood by most people in the region".

It is a matter of fact that since Independence Namibian authorities have implemented English as the official language, although in 1991 it was spoken by only 0.8 percent of the Namibians (census results, see Namibia 1994). Even today the percentage of those who can properly express themselves in the official language is not much higher, despite massive support for English language proficiency country wide, as displayed in the results of the 2001 population census (Namibia 2003). Therein major L1s are listed for each region, but not English.

The focus on English as the official language disempowers all other languages spoken in the country. L1s, but also Afrikaans and German are formally not accepted in official domains. As a consequence, only a tiny minority of Namibians can be directly addressed and is able to communicate with those institutions where the use of English is compulsory, while most other Namibians are relegated to the status of “silent objects of development” (Idris, Legère, Rosendal 2006: 44).

The biased position towards English in official domains and the lack of adequate linguistic competence and English skills transpires in many cases. For instance, when listening to the Parliamentary debates, it becomes very soon clear, that the way a number of MPs speak and use English leaves much to be desired. When in ministries and in central offices (and more at the regional level) civil servants speak to each other, they do so frequently in L1s. The same observation is made in law-enforcing institutions such as police stations, at the Hosea Kutako Airport Windhoek and army camps. In official domains English is a must in writing, while oral communication is conducted both in L1s and the official language, depending on the topic.

There are some state-controlled domains and activities, where the use of L1s is accepted and practiced. These include:

- Schools - L1s (also Afrikaans and German) are the medium of instruction in grade 1-3, becoming a subject in grade 4 and higher grades;<sup>22</sup>
- media - the national radio station Namibian Broadcasting Corporation (NBC) broadcasts in L1s, similarly news in L1s are televised daily at 6 pm and repeated next morning,<sup>23</sup> the state controlled daily newspaper “New Era” publishes news in L1s on a regular basis;<sup>24</sup>
- health services - i. a. AIDS or polio vaccination campaigns, and
- the population census of 2002 were conducted in L1s.

Regardless of these facts the strict policy focus on English is not negotiable. In 1994, after the 1991 census figures disclosing the extremely weak social basis of English were released, opposition members of Parliament complained about the official status of this language. This discussion was immediately turned down by the then acting Prime Minister Pohamba (the current Namibian President).<sup>25</sup> Subsequently when a language bill was introduced in October 1995 by the opposition, the SWAPO majority bluntly rejected this initiative. Another attempt of more properly addressing the linguistic situation was made in 2003, when the donor-funded AfriLa project (Upgrading African Languages) distributed a discussion paper. Its focus was on expanding the use of L1s in primary education. So far the Ministry of Education in charge has remained silent about the discussion, no progress is reported. This is again an evidence for the fact that issues pertaining to Namibian national languages and the country’s language policy are kept at a low profile by Namibian officials.

---

<sup>22</sup> These languages are Herero, Ju/'huan, Khoekhoegowab, Kwangali,, Kwanyama, Lozi, Manyo, Mbukushu, Ndonga. Tswana, German and Afrikaans are similarly treated.

<sup>23</sup> Prime time news at 8.00 pm are televised in English.

<sup>24</sup> The ruling party SWAPO newspaper “Namibia Today” (a weekly) publishes news in Herero, Khoekhoegowab, Lozi, *Oshiwambo* (i.e. Ndonga/Kwanyama) and *Rukavango* (mainly Kwangali). These texts are also available on the web as <http://www.newera.com.na/>

<sup>25</sup> See Legère (1995) for details.

#### 4. Conclusions

As stated initially, each country approaches the linguistic situation and the empowerment of her national languages from a different perspective. Tanzania has gradually, occasionally drastically, promoted the national language Swahili as the co-official language by introducing it into all official as well as other State-controlled formal domains. This country does not accept any of her many L1s in official and most formal domains. The paper argues that the empowerment of Swahili in the wake of the Tanzanian language policy was and still is an on-going process that also experiences setbacks. So far, the official status of Swahili in Tanzania results from a number of measures that all embark on empowering this language by legalising and stipulating its use in official and other formal domains. Even the long-awaited declaration of Swahili as the Tanzanian official language will not mean the end of this process.

In contrast, Namibia imposes with English a foreign language as the official language. There is no room for any other language in official domains, at least by law. In selected formal domains L1s play a certain role even in state-controlled institutions and initiatives. The State obviously tolerates or even supports alternatives such as L1s as media of instruction in lower primary education, radio broadcasts and TV news in national languages and elsewhere as long as they do not interfere with official policy by challenging the position of English as the official language. Having this aspect in mind, Namibia's language policy also entails elements of an endoglossic approach which, however, does not aim at empowering L1s to an extent where they could replace English in the long run.<sup>26</sup>

Comparing Namibia's position towards L1s with that of other exoglossic African countries, one lesson can be learnt - the existence of an official language quite rigorously excludes L1s from official domains, but not from other formal domains. A similar approach is practised e.g. in Kenya and Uganda, where L1s are i.a. used as media of instruction in primary education. This is also an argument for referring to official domains as a specific category within the domain discussion, since official (mainstream) language policy mainly deals with the legislative, executive and judiciary, while being more lenient and flexible when it comes to other formal domains.

The empowerment of national languages is intimately tied to a language policy which pays adequate attention to the complex linguistic situation. Namibia as well as Tanzania are still far away from an optimal approach as long as national languages (including Swahili) are not fully empowered. A feasible solution which respects linguistic human rights is both a theoretical and practical challenge.

# **Theory Development Process Towards Language Management and Policy: Examining Students' Beliefs (Language Orientations) in the JFL Classroom**

**Nariyo Kono**

Department of Applied Linguistics  
Portland State University

nariyo@pdx.edu

## **Abstract**

This paper discusses language beliefs with a focus on theory development processes. Reviewed and redefined, the orientation theories (taxonomies) were used as a research tool to examine a case study, and the empirical research results suggest additional development of the language orientation theories. Using a Grounded theory methodology, this case study focused on areas of language ideology and beliefs in the context of a Japanese-as-a-Foreign-Language (JFL) college classroom in the United States. The additional theory development helped to describe the needs of students who were studying Japanese as their heritage language in the JFL classroom. This paper shows the imperative need for detailed analyses of the political and ideological factors that go into language policy decisions.

**Keywords:** Language Policy, Language Orientations, Belief System, Heritage Language, Foreign Language Education.

## **1. Introduction**

Spolsky (2004) identifies three key areas (language practices, ideologies and beliefs, and language management and policy) that are driving the language policy (LP) field. Language community members share common sets of language beliefs and orientations that are a basis for language practice, and identifying both these beliefs and language practice should underlie language policies; currently some policies may contradict those beliefs and practices. The inter-relationships among these three key areas, especially the relationships between language practices and language beliefs, haven't been explored yet in the LP literature. This highlights some language planning theories with a focus on the areas of language ideology and beliefs and language orientations (Ruiz, 1984; Kono, 2001).

Before discussing Language Beliefs and Orientations, I will provide a brief

overview of trends in theories of Language Policy (Ricento, 2000; 2006). James Tollefson (2006: 44) offers this three-part definition of critical LP research:

- 1) It refers to work that is critical of traditional, mainstream approaches to LP research;
- 2) It includes research that is aimed at social change; and
- 3) It refers to research that is influenced by critical theory.

This research paradigm urgently suggests that critical LP researchers should look for the underlying ideologies in language policies and goals, should be concerned with research ethics and methodologies, and should pay attention to the concept of power (Pennycook, 2001; Reciento, 2000; 2006). In order to achieve this, some scholars suggest a historical analysis (Wiley, 1999), use of critical ethnographical studies (Canagarajah, 1993) and bottom-up approaches (Hornberger, 1996; 2006). In the same volume of Reciento's introductory book of language policy, Hornberger (2006: 42) reviewed several critical LP frameworks and models that were developed in the late 80's and 90's including her own integrated LP model and further suggests "using her LP frameworks as tools to examine and develop LP goals." I echo Hornberger's approach and also suggest using a critical framework or theory within the critical LP research paradigm. This paper, therefore, closely examines one of the critical LP theories, Language Orientations, and suggests further use of this theory as a research tool (Kono, 2001).

## **2. Orientations in Language Policy and Planning**

### *2.1. Orientations and belief system*

Richard Ruíz (1984) first introduced the terminology *orientations* into language planning and policy in the area of bilingual and minority language issues in the United States. Because of this, his orientations theory has sometimes been misunderstood as a theory which is only applicable to minority language issues or bilingual education; however, this theory can be applied to any language situation in the world. This theory has been often used by language policy makers and language planners in order to determine in which direction language policy and language ideology incline: language as problem, language as right, or language as resource. Later, Ruíz (1998) called this approach to language *evaluative orientations* and distinguished it from *descriptive*

*orientations.* Before I get into the details of the two types of orientations, I would like to review similar concepts in other fields that Ruíz (1984) also noted in his article. In addition, I have added Rokeach's (1968) beliefs study in order to make a link between Ruíz' orientations and theories of belief systems. The next table summarizes these five orientation related concepts:

Table 1: Orientation-Related Concepts

Studies	Discipline	Terminology	Key concepts
Boulding (1959)	Sociology	Image	Behavior depends on the image – the sum of what we think we know, and what makes us act the way we do. (p.6)
Kuhn (1970)	Science	Paradigm	Paradigm functions by permitting the replication of examples any one of which could in principle serve to replace it. (p.23)
Heath (1977)	Anthropology – social science	Language ideology	.. assumptions about language(s) different from those held by the communities or groups to which language planning will be directed.. (p.55)
Ruíz (1984)	Language planning	Orientations	A complex of dispositions toward language and its role, and toward languages and their role in society. (p.4)
Rokeach (1968)	Behavioral psychology	Beliefs, attitudes, and values	Beliefs have a cognitive component representing knowledge, an affective component capable of arousing emotion, and a behavioral component activated when action is required. (cited by Pajares, 1992, p.314)

All of the scholars above accepted the idea that abstracting human behaviors and thoughts is possible -- as theory. For example, Boulding (1959) states that describing the process of policy formation is possible, and he calls this abstraction an image, which is created and shared among people. Furthermore, he states that the core of the image is related to "role." In this sense, Boulding's notion of image is parallel to Ruíz' in the way he focused on the "role of language." Boulding also pointed out that the private/public distinction would be very important in the concept of image. This discussion could be applied to language as well, in the way people distinguish "private" language from "public" language.

Abstraction of human behaviors and thoughts is seen as “substructure” in the studies by Boulding, Kuhn, and Rokeach. The higher level of abstraction – image, paradigm, and belief – directs or structures human emotions, attitudes, knowledge behaviors and action like a web. These three scholars seem to have been strongly influenced by the *gestalt* school. Just as visual patterns arise from a mosaic of independently existing sensations like a jigsaw puzzle, these theorists believe that dramatic attitudinal and behavioral changes are possible once higher levels of beliefs are changed, in a kind of intellectual conversion. Rokeach (1968:159) explains this structure nicely. According to him, attitudes and values are substructures of belief systems. An attitude is “an organization of several beliefs focused on a specific object or situation, predisposing one to respond in some preferential manner”; on the other hand, “values have to do with mode of conduct and end-states of existence.”

Although Rokeach’s study is helpful to explain the web structure and shares similar characteristics with the other theories, beliefs seem to lack the larger, directional flow of the other concepts. For example, language orientations consist of different kinds of language beliefs such as beliefs about language variation, beliefs about standard languages, beliefs about mother tongue and so on. These individual beliefs compound to determine the orientation. The belief system is associated with affective, behavioral and cognitive components. Orientations, on the other hand, include several belief components (such as one’s mother tongue, ethnic pride, and position of power) and a collection of beliefs show some directional implications. Orientations themselves, therefore, are associated with specific knowledge, emotions and actions.

I conceptualize the relationship between orientations and belief system that sustain cognitive, affective and behavioral components. For example, the language-as-problem orientation might sustain a belief that national unity can only be accomplished in a situation where people speak one common or national language. And this belief or ideology promotes negative connotations and attitudes toward immigrants or minority languages, and discriminatory behaviors toward the languages and the people who speak them.

In my own research, I have not focused on the distinctions among beliefs, emotions and actions. Rather, I treat them as various components that show some essences of each orientation. Examining discourse, as well as their behaviors, helps to identify orientations. In other words, this is a bottom-up approach to policy and language planning research with contextualization.

The real challenge to language planners and policy makers is to see if they can transform the language-as-a-problem orientation to the language-as-a-resource

orientation, and if so, how? If beliefs can be altered and consequent attitudes and behaviors could be changed as Boulding and Rokeach say, maybe there is a possibility that orientations could be altered. Detailed discussions about what components contribute to each orientation on any cognitive, affective or behavioral level, or how they contribute should help to answer these questions.

## *2.2. Descriptive orientations*

Ruíz (1984) introduced some previous orientations suggested by Tauli (1968) and Kelman (1972). In his own work on orientations, according to Tauli (1968: 9), “language is a system of signs, the main purpose of which is communication... language is an instrument, a means, never an end.” On the other hand, Kelman assumed that language is tied up with group identity, and “language is an important aspect of self-expression and self-identification” (Ruíz, 1984:17). This view might be called “language as sentimental attachment” as opposed to Tauli’s instrumental view of language.

Theodore Andersson (1964), who was an early advocate for foreign languages in elementary schools in Texas, suggested four values of modern foreign languages: language as a tool; language as communication; language as culture; and language as style. His first view, language-as-tool, presents an instrumental view of language. Andersson (1964: 305) explains the view as the “narrowest concept of language, though one widely held.” This view is similar to Tauli’s instrumental view toward language. The second view, language-as-communication, also seems to overlapp with the language-as-means view by Tauli. According to Andersson (1964:312),

“One language makes a wall; it takes two to make a gate. That is why Americans, praying for peace and seeking an increase in international understanding, now gather to discuss foreign language study as a means to these ends.”

Andersson (1964: 319) thinks that foreign languages are an essential part of a liberal education. Language-as-communication helps to break “human barriers” and to “free an individual from his own linguistic limitations.” The third view is language as culture. Andersson (1964:312) holds the anthropological stance of culture: “culture as a total way of life, the learned and shared patterns of behavior of a group of people living together.” Consequently, this anthropological stance reflects his view of

language. Andersson (1964: 313) defines language thus: “in expressing typical feelings, thoughts, attitudes, and values, language is both a vehicle and a mirror of culture.” The last category of language is style. According to Andersson (1964: 319), studying the literature contributes to the “freeing and to the cultivation of the human spirit.”

Andersson’s articulation of views toward language and foreign language education is remarkable. In the section on language-as-culture, he also mentioned foreign language teachers as foreign culture teachers, and predicted that teaching culture would be emphasized in foreign language education. As he predicted, teaching culture is becoming an increasingly marked dimension of foreign language education. As a continuation of this discussion, I will include classroom culture and teaching culture segments in the next section.

Ruíz (1998) synthesizes these perspectives of language and suggests the following typology as descriptive orientations: language-as-a-tool; language-as-means; and language-as-a mediator of culture. Using Kelman’s (1972) terms, language-as-a-tool and language-as-means seem to address the instrumental view of language; whereas language-as-a-mediator-of-culture expresses the sentimental attachment of language.

Since complete descriptions of Ruíz’ Descriptive Orientations had not been given by the author during my study, I interviewed him (March 4, 1999) and asked him to provide more explanation about his typology. The interview session was tape-recorded. My main concern was to distinguish between *language-as-a-tool* and *language-as-means*. In the interview Ruíz explained *language as a tool* as something that relates to technocratic ideas; for example, speaking Spanish might help somebody who lives in Nogales get a job. *Language as means* also deals with instrumentality of language, but is better characterized as a vehicle rather than a tool. Ruíz gave the metaphor of using a telephone as an example. While a telephone receiver can be used to crack open a walnut in order to eat it (language-as-tool), it is more commonly conceived of as a vehicle for sending messages (language-as-means). Both concepts have instrumentality more or less; however, *language-as-a-tool* could be thought of as more immediate, instrumental and technocratic, where *language-as-means* refers to opportunities for the use of the language.

Based on the information above, I summarize Descriptive Orientations as follows:

Table 2: Descriptive Orientations

Descriptive Orientations	Definitions
<b>Language as a tool</b>	The orientation that sees language as enabling people to complete a task or achieve a goal; the view that would utilize the language, for example, as a tool to get a job or to complete a task.
<b>Language as means</b>	The orientation that sees language as a medium for communicating thoughts, feelings, and expressions; the view that would objectify the language or would emphasize linguistic components such as lexicon, grammar or writing system.
<b>Language as a mediator of culture</b>	The orientation that sees language as conveying culture; the view that language is tied up with identity, family, community or society.

### 2.3. Evaluative orientations

Ruíz' Evaluative Orientations appeared in "Orientations in Language Planning" (1984) and, since then have been widely used as one of the crucial concepts in language planning (Hornberger, 1994; Baker, 1995; Crawford, 2000; Djite, 1994; Cummins, 2000; Hubner & Davis, 1999; Kontra, et.al., 1999; and Zephir, 1997). Since his article appears in the context of US policy analysis, this theory might mistakenly be thought to apply only to limited situations such as bilingual education in the US and the language-as-problem orientations. However, this is a theory in language planning that can be and has been applied to any situation in the world. Also, after he published his article in 1984, people have interpreted the theory in differently. Again, I interviewed Ruíz about these concepts, especially how about these concepts are related to Freire's critical pedagogy framework (March 4, 1999).

Ruíz explained that he originally provided the three different directions (orientations) without suggesting any relationships among them. Then, some of his students used the three orientations as sequential stages beginning with language-as-problem to language-as-right orientations, then moving from language-as-right to language-as-resource orientations, as if the first was a prerequisite to the second, and so on. An alternative view posits a possible relationship among the three based on critical theory pedagogy, and this view further states that Ruíz interprets Freire's ideas as presenting a tension between the oppressed and the oppressors, and suggested the "new man" (the third person) as a new solution; that is, both the oppressed and the oppressors

need to change, and look for a new organization or new ideology. Ruíz sees the ideas of Giroux (1988) similarly; he applied the concept of the tension between the two “opponents” to language, and developed his ideas of “language-of-oppression” and “language of possibilities.” Ruíz applied Freire’s framework to his orientations and explained as follows:

There is a tension in the real world. Some people see language as a real problem like the case of Navajo language. The society reinforces this orientation. On the other hand, there are other people who claim that the maintenance of the language is the right for the speaking community. So, there is a tension between language-as-problem and language-as-right. We hardly find any examples of language-as-resource in the real world. But Freire saw in the world a tension between the oppressors and the oppressed, and suggested a solution as the third person (the new man) coming out of the tension between the two. That is probably applicable to the orientations. The language-as-resource orientation might be seen as the third (alternative) orientation coming out of the tension between the two orientations (language-as-problem and language-as-right).

(Ruíz in the interview: March 4, 1999)

Below I summarize and compare several definitions of evaluative orientations that appear in the literature (Baker, 1996; Ricento & Hornberger, 1994), and add insight from critical pedagogy, and summarize the definitions as follows:

Table 3: Evaluative Orientations (Critical Pedagogy)

<b>Evaluative orientations</b>	<b>Definitions</b>
<b>Language as problem</b>	The orientation that would see the local language as a problem or some kind of burden for some specific purposes such as uniformity or similarity within the community
<b>Language as right</b>	The orientation that would see the community language as a basic, human right; there should be an individual right to choice of language. There is often a tension between this view of language and the language-as-problem orientation.

<b>Language as resource</b>	An alternative orientation to the language-as-problem and language-as-right orientations; the idea of language as a personal and national resource including cultural, spiritual and educational growth as well as economic, commercial and political gain.
-----------------------------	---

These orientations overlap and mix within the society and are dependent on contexts. I assume that there is no simple orientation for any situation. Furthermore, I assume that it would be difficult to determine the appropriate orientations without minute data analyses since their relationships are complex.

In addition to these theories of evaluative orientation, there are additional interpretation of orientations that are useful to consider. There are some different interpretations toward orientations as a theory in language planning and policy. Wiley (1996: 116) interprets orientations from an historical-structural and ideological approach that includes socio-historical factors of language use and political questions that inadvertently support the status quo. He assumes that:

The historical-structural and ideological approaches can essentially be placed in both the language as right and the language as resource orientations because language planners adhering to them frequently become advocates for language rights and also try to promote the maintenance and/or development of minority languages as social, cultural, and political resources.

On the other hand, Crawford (2000) considers orientations as a useful tool to analyze sociolinguistic issues and to summarize policy alternatives, but thinks it is less useful in analyzing political and ideological factors. Crawford reluctantly assumes that collective language rights are lacking in the United States. Furthermore, Kontra, Phillipson, Skutnabb-Kangas & Varady (1999: 6) approach Crawford's view critically. They urge people to exercise "linguistic human rights" in the framework of "problem" or "resource" as complementary goals, as follows:

Firstly, people need linguistic human rights in order to prevent their linguistic repertoire from becoming a problem or from causing them problems. Secondly, people need to be able to exercise language rights in order for their linguistic repertoire to be treated as, or to become, a positive, empowering resource.

The issues of linguistic human rights has been discussed in Ruíz' language

orientations. Ruíz (1990: 17) explains that “the language-as-right orientation is most visible... when the dominant language-as-problem orientation is taken to extremes.” If I, furthermore, carry Kontra et al’s framework of orientations to a discussion of the relationship between the language-as-resource orientation and linguistic human rights, I assume that the relationship would probably be as follows: the language-as-right orientation is most *invisible* when the language-as-resource orientation fully underlies the community or the society. In language-as-problem oriented communities, people need to protest their violations of linguistic human rights in order to protect their identity and rights whereas those efforts are not necessary in the language-as-resource oriented communities in which minority languages are protected and multiple identities are encouraged by the communities themselves. In other words, the language-as-right orientation is a barometer of whether the community is categorized as a language-as-problem oriented or a language-as-resource oriented society.

The linguistically *homogeneous* or *monolingual* countries like Japan or the United States (categorized by Lambert, 1995; Spolsky & Shohamy, 1999) would need this kind of effort: making minority languages and community languages more visible in order to achieve exercises of linguistic human rights. The movement for collective linguistic human rights has been seen only recently in the United States, advocated by Brecht et al. (Heritage Languages Initiative, 1999).

Crawford (2000) speculates that US language policies have been just caught in the cross-fire of political arguments. Foreign language education is not an exception, either. Ortega (1999, 2000) warned about the lack of political awareness of foreign language educators, and that it could result in failing the needs and goals of multilingualism and multiculturalism among minority students. The elite view toward foreign language education, which originated historically in the US, excludes minority language communities and minority students. Ortega concludes that foreign language professionals can achieve these goals – multiculturalism, multilingualism and language-as-resource orientation – when they incorporate minority students’ points of view in their teaching. For example, in my own research on Japanese Americans in Japanese language classes at university-level shows that their view towards language was not reflected in their language classroom practices and policy. This suggests that people would need an over-reaching language policy as a program as well as language policies nationally.

### 3. Case Study

#### 3.1. Overview of the research

One hundred students were enrolled in the Japanese as a Foreign Language (JFL) program at a university in the Northwestern United States. I use ‘Northwest University’ as a pseudonym in my paper. Three professors and nine graduate teaching assistants were team teaching the classes including the four-year language classes, Methodology classes, Japanese literature classes, and so forth. All of the teachers and students in the program were the participants in my study. I conceived of the language program as a language community, and the teachers and students participated in my study on a volunteer basis. I asked them to volunteer for several separate activities.

Based on a previous questionnaire study (a pilot study), the descriptions of language were gathered (see Table 4) and, further, used for card-sorting activities. I used Cluster Analysis methods to describe the descriptive orientations. The results from those analyses as well as learning/teaching scenarios were used to elicit the participants’ perceptions about what language is (descriptive orientations) and their normative stances or attitudes toward the role of language in the Japanese classroom (evaluative orientations) during interviews. Also, classroom observations and other information sources were used to discover evaluative orientations. There were two kinds of interviews: confirmatory and exploratory interviews. By “confirmatory” I mean that I used some interviews to confirm or discuss with the participants some results of the cognitive maps and others; by “exploratory” I mean that I used the other interviews to elicit the participants’ opinions or ideas about language and foreign language education. During the exploratory interviews, both the cognitive maps and the scenarios were partially used as tools to evoke the participants’ memories, to bring up some of the issues about which they usually are not conscious, and to let the participants reconsider/reevaluate what they feel about language and foreign language education and how they value them. Interviews with the participants, classroom observation and other sources were transcribed and coded. I used the categories which emerged from analyses as well as the existing theories (Ruíz, 1984, 1998) as potential coding schemes. However, I left those schemes open to change or modification since data analysis is a process of interaction between the data and theories (Glaser & Strauss, 1967), and the coding process itself is part of theory-building or theory-elaboration.

My approach to the research was “educative, collaborative, transformative and active” (LeCompte & Preissle, 1993). In other words, my research was done *with* the

participants, rather than *to* the participants. I tried to create an atmosphere in which the participants felt comfortable enough to collaborate *with* me and to develop a good rapport between me and the participants. I asked for their feedback to my research process, and I gave them my feedback from time to time. At the end of the research, I felt that the participants moved toward me as much as I moved toward them. My research was an on-going process, and the research itself was developed and evoked through the collaborative effort of both the participants and myself. For example, the results of multidimensional scaling and hierarchical cluster analysis provided visual maps that I then shared with the participants. I especially chose these techniques for this study so that I could discuss the interpretations together with the participants. Part of the ongoing auditing process to ensure trustworthiness and appropriateness in the findings involved sharing and discussing results with the participants (Lincoln & Guba, 1985). In my research, language is treated as a psychological construct, and the participants' perceptions on language have been explored using various research techniques as a case study.

Table 4: Descriptions of language for card sorting

1. fun	2. fluidity/change
3. identification of people	4. expressing cultures
5. learning culture norms, standards	6. formal study
7. self-identity	8. using culture norms, standards
9. nonverbal aspects	10. words, vocabulary
11. rule-governed	12. writing system –kanji(orthography)
13. international, foreign	14. express individual feelings – medium for expression
15. spoken language, speaking	16. grammar, word-order
17. fluency/proficiency	18. slung, humor
19. power/privilege	20. politeness
21. background characteristics (personality, gender, age)	22. individual languages (Japanese, English)
23. means of communication	24. tool to convey values, beliefs, and thoughts
25. communication	26. helping you in job career

### 3.2. Cluster analysis results: Five language-concept clusters

The cluster analysis suggests five clusters. After I examined the category names in the questionnaire and discussed several naming possibilities with the participants, the following five language-concept clusters were determined.

Table 5: Five Clusters (The phrases in italics are the actual items on the cards.)

Five clusters	Interpretations
<b>Culture</b>	Pertaining to culture and identity, for example, <i>learning culture norms, using culture norms, politeness, background characteristics, identification of people, expressing cultures or self-identity</i>
<b>Power/use language to get ahead</b>	Powerful aspects of language and usefulness for personal benefit, for example, <i>international, foreign, power/privilege, fluidity/change, helping you in job</i>
<b>Communication</b>	Communication aspects of language, for example, <i>fun, slang, humor, means of communication, tool to convey values, medium for expression, two-way communication</i>
<b>Speaking</b>	Aspects of speaking, especially in the language classroom, for example, <i>fluency/proficiency, individual languages, spoken language</i>
<b>Formal study/structured</b>	Structured aspects of language or some aspects that you get in language classroom, for example, <i>rule-governed, words, vocabulary, grammar, word-order, writing system</i>

The culture category includes some culture-related concepts such as learning culture norms, using culture norms, and expressing cultural concepts. Ruíz (1998) conceptualizes two types of orientations: descriptive and evaluative. One of the descriptive orientations is ‘language as a mediator of culture’, and Category A (culture) fits well into this type of orientation. However, two different discussions emerge in this category. The first discussion seems to represent ‘learned culture.’ In other words, participants seem to capture culture as something they are learning in the class. The first part includes learning culture norms, using culture norms, politeness and background characteristics. Background characteristics (personality, gender, and age) and politeness are closely linked to culture concepts in the Japanese classes, where the

relationship between language and culture is heavily emphasized. Students are taught that they need to change language behavior depending on the relationship between the speaker and listener. Age, social roles, social status, and gender make every spoken interaction different. The students in this program are taught about those subtle differences in grammar classes in English, and then they practice with native instructors in drill classes. They call the grammar and culture classes “Fact classes” and the drill classes “Act classes”. In Act classes, the students are required to perform their own role in each drill. The instructors assign the students some roles and let them practice different levels of speech. Politeness is one of the key factors they need to learn and to utilize in the Japanese class. Therefore, it seems quite natural for them to put those terms together (learning culture norms, using culture norms, politeness, and background characteristics).

The second discussion of this category includes identification of people, expressing cultures, and self-identity. A couple of interviewees addressed the differences between the two parts wondering why ‘culture’ and ‘self-identity’ are combined in this category, even though most of them decided to name it as ‘culture.’ The second part of this category was not addressed in the textbook, or observed in the classroom. In the pilot study, those terms were brought into the survey by several students who had different backgrounds. One of the interviewees said that she had learned how important the language could be, especially to minority language communities (e.g., Native Americans in the United States) in the Anthropology class that she took previously, and how closely language and identity were connected. She also emphasized the tight relationship between language and culture. A couple of other students said that they were learning Japanese because they wanted to know their ancestors’ culture more, and to search for their own identity. One student, who was born in the United States and whose mother is Japanese, said that language would differentiate ethnic groups and suggested the term ‘identification of people.’ Those students all suggested a strong relationship between language and culture. I assume that’s how the second part (‘identity’) was connected to the culture category; however, the orientation of the second part seems very different from that of the first ‘learned culture’ part. The students can learn and use the learned culture norms, whether they are visible or invisible. How you express culture as your own and how you connect the culture (or language) with your identity are different from just learning something in the classroom.

The second category represents power/use of language to get ahead. This category includes the following terms: international, foreign, power/privilege, fluidity/change, and helping you in job/career. Most of the terms explain how much

benefit students can get from learning (foreign) languages. Additional languages help the students to have more effective communication with those from other countries, which gives them more power and privilege. By learning a language the students might gain different perspectives or more flexibility (ability to change). Being fluent in more than one language might help the learners get better careers or job positions. All of those elements indicate the instrumentality of language. In other words, this category shows that language can be a powerful tool in society. By using this tool, learners can get ahead and gain more power. This category indicates an aspect of another descriptive orientation – language as a tool.

The communication category shows some aspects of language-as-means. This category includes the following terms: means of communication, tool to convey values, beliefs and thoughts, medium for expression, and two-way communication. Those elements show that language is used as a means of communication to express values, thoughts and so on. Interestingly, the participants put two other cards (fun and slang, humor) together into this communication category. The Japanese classroom places a lot of emphasis on communication activities. Japanese teaching assistants seem to spend much energy and time inventing fun activities to facilitate learning in the classroom. Students learn Japanese not only in the classroom; but the program also provides some opportunities for students to speak Japanese with native Japanese speakers in tutoring sessions. If the students are interested in working with somebody, they can have a conversation partner. Some exchange students from Japan and students in ESL classes also participate in these activities. Both the students in Japanese classes and the students learning English interact and facilitate their respective learning. I also observed more student-facilitated activity in one of the cafeterias. There was a group of people who spent some time together for lunch, tea, chats and study. They seemed to come together voluntarily and to enjoy each other's company. The group members included some Japanese teaching assistants, first year students in Japanese classes, Japanese students in ESL as well as exchange students from Japan, and a few other non-Japanese. The students seemed to try their learned Japanese outside of the classroom and to seek out more humor, slang and a lot of fun.

The next category represents speaking. It seemed strange when I first looked at this particular category. However, the program puts so much emphasis on speaking, I assume that it would be natural that this came out as an independent category. This category includes the terms: fluency/proficiency, individual languages (English, Japanese), and spoken language. One of the interviewees said that the program emphasizes fluency as well as proficiency, particularly in speaking.

The last category is formal study/structure. It includes the following terms: formal study, rule-governed aspects, words & vocabulary, grammar & word-order, writing system-kanji and nonverbal aspects. Most of the terms strike me as “the things that the students learn in the classroom” and most of the interviewees’ answers indicated the same. In the confirmatory interviews, a couple of students, as well as myself, questioned why nonverbal aspects were included here and not in the communication category. A couple of other interviewees in the first year answered this question. In the role-playing dialogues used in their classes, non-verbal aspects were emphasized. For example, when you introduce your wife/husband to your boss, how do you use your hands to indicate people? When you give a present to a host, how do you do it? These nonverbal details were introduced to the students in many ways. First, the grammar teacher might show the lesson video that includes the dialogue and explains why the actors are behaving that way. Second, the drill teachers actually show the students how to perform; and finally the students practice their role-plays. I observed one scene in a classroom where a drill teacher explained to one student how deeply he needed to bow in the particular situation. Since the drill classes were conducted in Japanese, the instructor imitated the student’s gesture and showed her own several times with some explanations in Japanese. The student tried to imitate his teacher several times.

### 3.3 Comparison of Five Clusters and Descriptive Orientations

I compared Five Clusters (Table 5) and Descriptive Orientations (Table 2) and found out that there are extensive overlaps between the two.

Table 6: Comparison between Descriptive Orientations and Five Clusters

Descriptive Orientations (DO)	Five Clusters
<b>Language as a tool</b>	<b>Power/Use language to get ahead</b>
<b>Language as means</b>	<b>Communication</b> <b>Speaking</b> <b>Formal study/Structure</b>
<b>Language as a mediator of culture</b> (Emphasis on first language and culture)	<b>Culture</b> (Emphasis on cultures in general)

The power/use language to get ahead cluster is easily related to the language as a tool category in Descriptive Orientations (DO). Speaking Japanese or other languages helps

the participants to feel “foreign” or “international”, and they believe that these aspects might help advance their career or help them get a job. This view has in origin a very instrumental orientation, as articulated by a couple of interviewees:

- As an international person by learning a foreign language, you can advance yourself by speaking another language.
- [By being able to speak Japanese, I’ll get] prestige, credibility. I could go to a Japanese construction company or could be an administrative manager.

The communication cluster corresponds the language as means category in DO. The participants seem to have an orientation that sees language as a medium of thoughts, feelings, and expressions. The items such as *Means of communication*, *Tool to convey values*, *Medium for expression*, and *Two-way communication* were sorted into the Communication Cluster and seem to reflect this view. One of the interviewees emphasized this communication aspect in foreign language education. “People [who learn a foreign language] will be able to communicate with a better understanding of each other without miscommunications...” Also, one of the instructors believed that foreign language teaching might contribute to world peace by reinforcing world-wide communication.

The culture cluster overlaps with the language as a mediator of culture category in DO; however, DO’s definition seems to emphasize the relationship of “language and identity” (i.e., the view that language is tied up with identity, family, community or society” in Table 4.2) whereas the CULTURE cluster includes elements of both first and other languages as they relate to culture and identity. To me DO’s definition explains the L1 situation well, but not the L2 or LX situation. Also, it was difficult to code using this system. Consequently, the new version of the language as a mediator of culture category shows two different emphases: [C1] first language and culture (i.e., the view that mother or heritage language is essential for development of ethnic identity); and [CX] any language and culture (i.e., the view that cultural aspects are essential in the first or second or any language) (Table 7).

The language as means category has two themes, and the coders reported the difficulty of coding for that reason. Therefore, I decided to develop new definitions extending the language as means category into two different emphases: [MC] communication and [ML] linguistics (Table 7). In this way, the modified version can include the aspects of the speaking and formal study/structure clusters. The speaking cluster appears closer to the formal study/structure cluster than to the communication cluster. The analyses support this categorization based on the semantic proximity

obtained using hierarchical cluster analysis. This is consistent with the teaching methodology used in the program. “Speaking” is emphasized so much in the classroom because of their teaching methodology. Moreover, most of the interviewees separate “speaking” from “communication” in terms of “instrumental” versus “sentimental” strands. “Speaking” is something that you need to practice in the classroom although “communication” has been a goal in the program. For example, one of the interviewees said, “Right now, my girlfriend is Japanese and she doesn’t speak very much English and I don’t speak very much Japanese, so we help each other.” His desire to “communicate” with his girlfriend furnished his motivation toward learning Japanese. On the other hand, the Formal Study/Structure Cluster seems to emphasize more structured aspects of language such as words, grammar, word-order, and writing system. I defined these aspects as [ML] linguistics: the view that objectifies the language or would emphasize linguistic components, and is differentiated from [MC] communication: the orientation which sees language as a medium for the communication of thoughts, feelings, and expressions (Table 7). This view is reflected in arguments on linguistic competence versus communicative competence articulated by Hymes (1972). The distinction generates opposing approaches toward language and language teaching: the view that sees language as a linguistic system, and the view that sees language as a means of communication. In the latter view, effective language means the competence to communicate effectively rather than to demonstrate grammatical accuracy or fluency. The language as means cluster indicates that the participants in this study retain both views.

I conducted classroom observations and structured interviews with the students and teachers, specifically focusing on the role of language, but in a broad context including the role of foreign language education related to perceptions of language and the role of language. After the examination, I used 82 events for coding, and chose twenty-nine representative transcripts. Four individuals who have linguistics and TESL/TEFL backgrounds were asked to check the appropriateness of the coding schemes. After I modified the descriptive orientations, the average agreement among the coders was improved from 49.7 % to 60 % in the Kappa formula (from 67.2 % to 77.5 % in raw agreement). The changes in conceptualization of orientations and the cluster formations that resulted from informant responses led me to change my formulation of descriptive orientations as presented in Table 7.

Table 7: Descriptive Orientations (Modified)

Descriptive Orientations (Modified)	Definitions
<b>Language as a tool</b>	The orientation which sees language as enabling people to complete a task or achieve a goal; the view which would utilize the language, for example, as a tool to get a job or to complete a task.
<b>Language as means:</b> <b>Language as means of Communication [MC]</b>  <b>Language as linguistic means [ML]</b>	<p>The orientation which sees that language as a medium of communication of thoughts, feelings, and expressions.</p> <p>The view which would objectify the language and would emphasize linguistic components such as pronunciation, lexicon, grammar, and writing systems.</p>
<b>Language as a mediator of culture</b>  <b>Two different emphases:</b> <b>First language and culture [C1]</b>  <b>Any language and culture [CX]</b>	<p>The orientation which sees language as conveying culture aspects; the view that language is tied up with identity, family, community or society.</p> <p>The view that mother or heritage language is essential for development of ethnic identity.</p> <p>The view that culture aspects are essential in the first, second or any language</p>

#### 4. Conclusion

Detailed interviews were conducted to confirm the case study data and also to further explore their values and concepts in the language community. The study confirmed that this particular community reflected many aspects of the language-as-resource orientation, and most of the participants' voices and hopes were explicitly included in the program policy in foreign language education. However, heritage

language identity issues were not explicitly discussed in this particular community, and my study suggested that there should be a place for the heritage language learners to address this issue in the program (Kono, 2001).

Current LP research trends suggest the use of micro-level research and data analysis methods, such as ethnography (Canagrajah, 1993) or discourse analysis (Lo Bianco, 1999; Wodal, 2006). I echo those scholars and suggest further that a micro-level of policy analysis is needed to untangle the interrelations between language beliefs and language policies. My case study demonstrated the use of the theories of language orientations as a research tool within the college-level classroom context of Japanese as a foreign language. This exploratory study is founded in Grounded Theory (Glaser & Strauss, 1967; Strauss & Corbin; 1994, 1998), which emphasizes ‘research as a process.’ The recent version of this theory encourages the use of both qualitative and quantitative methods. They highly recommend bottom-up approaches rather than meta-analyses; however, they also accept researchers as individuals who bring their own beliefs and backgrounds to their research and analyses, including existing theories.

I conducted a two-year ethnographic study and compiled sources of data using practices such as interviews, observations, and card-sorting activities, all of which used the language orientation theories as a research tool. I developed coding systems of both descriptive and evaluative orientations for examining the discourse level. “A combination of descriptive orientations and evaluative orientations makes it possible to examine the causative relationship between the evaluative orientations and factors” (Kono, 2001: 196). This suggests the imperative need for detailed analyses of the political and ideological factors that go into language policy decisions. By doing this kind of microanalysis, researchers can avoid overgeneralization, which has been a major criticism of critical theorists, and further this research suggests important implications between language practices and language beliefs, which we hope models a technique for researching and defining future improvements to any language education setting.

# Language Policy-Planning and the Interactive ‘Turn’: the Case of the European Union

Patrick Studer, Mi-Cha Flubacher, Felicia Kreiselmaier

Department of Linguistics, University of Bern

## Abstract

The article analyses language policy-planning at the European level, focusing on spontaneous and individual discursive activity as a relevant factor in the construction of political discourses. The authors argue that the micro-interactive perspective contributes to the study of language policy-planning when analysing inconsistencies or discrepancies in discourse. Using discursive psychological approaches, two excerpts from semi-structured interviews with policy-makers are examined with regard to the conflict potential language policies present to individual social actors and the ways these conflicts are addressed during interaction.

**Keywords:** language policy-planning, multilingualism, micro-interaction, role conflict, discursive psychology, language attitudes and identity.

## 1. Introduction

This paper is concerned with the micro-environment of language policy-planning in a specific socio-political context, i.e. spontaneous speech of policy-makers in different European institutions.<sup>1</sup> It particularly addresses the complexity of the concept of ‘language policy-planning’ from a theoretical and methodological perspective and seeks to contribute to building an integrated theory and method for a comprehensive study of language policy-planning discourses. At the core of this paper lies the assumption that too much attention has been paid so far to describing macro-political, i.e. socio-political, dimensions of policy-planning. We believe that the macro-perspective has only limited explanatory potential to describe language policy-planning processes on the ground, which are carried out by individuals trying to cohere with the world in which they live. We would like to illustrate this tension and shortfall in explanatory models by presenting results from fieldwork activities with policy-makers from various positions and at different stages in the language policy-planning process. We will propose assumptions about how micro-interaction of language policy-planning can be fruitfully theorised by discussing two short excerpts from semi-structured interviews conducted with policy-makers of the European Union. We intend to show that the clash between personal and institutional ‘identities’ constitutes a powerful factor in the construction of language policy-planning discourse that contributes to the decision-making process.

The ideas expressed in this article are solely those of the authors.

## 2. Language policy-planning revisited

We would like to begin our discussion by revisiting our definition of language planning which we proposed in an earlier paper: “Language planning in a very general sense will be understood as a discursive event aimed at resolving issues pertaining to the function and use of languages in specific contexts” (Studer et al. 2008:10).<sup>2</sup> Implied in this definition is the notion of language planning as planned conventionalised behaviour between interactants. The reference to planning here reminds us of linguistic activity in Levinson’s (1998) sense, while the reference to discursive event can be interpreted in terms of Hymes (1974) and Gumperz (1982, 1992), i.e. as verbal behaviour which is external to task-oriented activity and thus outside the activity frame of language policy-planning.

Gumperz’ (2003: 219-220) proposal of a personal perspective in interactional sociolinguistics seems to bridge the concept of event and activity in the study of talk exchange. He stresses the difference between the concept of “communicative practices shaped by habitus” (especially macro-societal conditions) and the constructivist approach (interactive construction of the world). The questions deriving from these considerations which are relevant to the present discussion can be formulated as follows: 1) how and by what signalling devices does language function to evoke the contextual presuppositions that affect interpretation of the interactants; 2) what kind of presuppositions are at work in particular talk exchanges? In other words, the analysis of spontaneous language planning, as understood here, needs to take account of ‘conversational inference’ of interactants (Gumperz 2003: 219) and of the relationship between interaction and inference.

The reference to the aim of resolving issues that pertain to language function and use in our definition agrees with Cooper’s (1989: 35) focus on language behaviour. This means that language planning is prompted by personal, political, institutional or social motivation to influence the language behaviour of others which surfaces in differences, controversies, disagreements or disputes (within and) between social actors. Thus, language planning does not primarily solve language or linguistic problems but represents a clash of ideas and ideologies regarding the use of languages in specific situations.

### 2.1 ‘Privatised’ language planning contributions

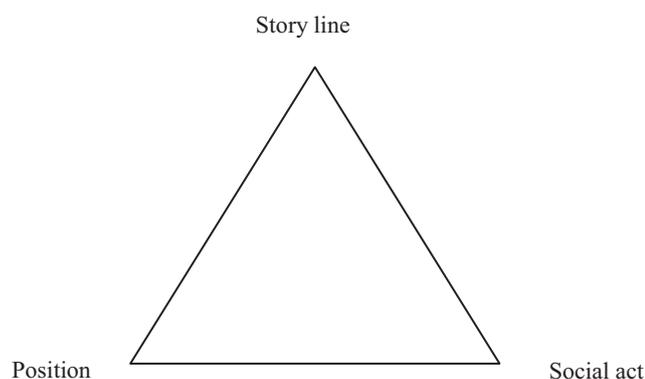

The difficulty in the definition of language planning as outlined above is that it directs attention to micro-interaction between policy-makers by focusing on relevant contributions that reveal the contextual presuppositions of individual policy-makers. Here we have to make some fundamental assumptions: Firstly, contextual presuppositions are expressed in personal contributions (i.e. in expressions of their minds), and the mind expresses itself or forms itself discursively. This assumption reflects a discursive psychological view which is understood as the “idea of an ontology in which utterances, interpreted as speech acts, become the primary entities in which minds become

---

<sup>2</sup> We understand language policy-planning as embodying two separate strands of discourse: that of (mostly oral) planning activities and that of the drafting process of policies (Studer et al. 2008: 8-12). When we speak of language planning in this paper, we particularly refer to the stage of oral language planning prior to the drafting of policies.

personalized, as privatized discourses” (Harré/Gillet 1994: 36). Secondly, the mind expresses itself or forms itself in attitudinal structures (i.e. in the form of a constant evaluation of the ‘lifeworld’). These attitudinal structures are counterevaluative in Billig’s (1991) sense of the term. Thirdly, our evaluation of the world tends to follow a narratory principle (Sarbin 1986), in which “human beings think, perceive, imagine, and make moral choices according to narrative structures” (Sarbin 1986: 8).

Based on these considerations we can draw a triangle (cf. Figure 1) showing relationships between the position of speakers within the larger interaction context, the act that is performed by those speakers and the story line in which position and act are embedded: Such a ‘positioning triad’ has found its way into the theoretical framework of discourse analysis with three distinctive elements: “the story line evolving in an episode, the relative positions of speakers with respect to the local conventions of rights and duties of speaking or otherwise displaying judgments and/or expressing illocutionary acts, and the social acts they perform” (Harré/Gillet 1994: 156; cf. also Harré/Moghaddam 2003: 5-6).

**Figure 1** Positioning triad (adapted from Harré/Gillet 1994)

Discourse, in the discursive psychological tradition, is understood as an “institutionalised use of language and language-like sign systems” (Davies/Harré 1990: 45) at different levels. The central notion of social act in this line of thought is closely linked to speech act theory in which “speech-*action* can become a determinate speech-*act* to the extent that it is taken up as such by all the participants” (Davies/Harré 1990: 45).

The discursive ‘turn’ in psychology can thus be interpreted as an acknowledgement of the importance of performance style in real life episodes which is believed to have explanatory potential for the formation and expression of the self (Harré/Moghaddam 2003: 3). The interpretation of these episodes as highly situation-specific and context-sensitive ties in with our view of language policy-planning as a cultural/societal event. The interplay between situation and context is very complex and subject to contextual rules and conventions as well as to locally negotiated positions of participants within those conventions, reflecting “subtly varying presuppositions” of those people participating in interaction (Harré/Moghaddam 2003: 4). What complicates the analysis of the positions of participants is the possibility of multiple positioning of the same person during interaction (Davies/Harré 1990: 46). This various positioning can be seen, for example, in inconsistent choices people make in relation to different discursive practices.

People's discursive positions can be derived from many factors. Language policy-planning activities, for example, seem to invite a specific set of practices along which policy-makers can position themselves. For one, language is a concept that is immediately meaningful and relevant to every human being, prompting discursive activity that expresses a personal subjective position (or opinion) about language use. Unlike many other policy areas, language planning takes place, in its smallest form, in every family environment. It can be expected that these rather private discursive practices from the small group level become activated at the more global level of policy-making for larger communities. On the other hand, policy-makers' interactions are bound to be shaped by ideas or beliefs they express about language which can be related to the role they occupy in the planning process. This means that some beliefs and ideas about language are expected to be negotiated on the basis of shared assumptions about how policies (should) come about and about the impact they should have. Although this can be a creative process, participation in an 'official' language planning activity embeds language in a larger policy script which follows more or less 'ritualistic' rules. This script corresponds to the shared ideas people have about institutional role, conventions and duty; the more personalised dimension embodies the particular set of ideas individuals have about language that reflects their private belief.

In language planning activities, verbal communication among policy-makers is expected to be oriented along these lines, and is characterised by a constant (re-) negotiation of positions between the private and the institutional self. Obviously, the discrepancy between the two levels of positioning can be assumed to be greatest in situations where role, duty or conventions contrast or conflict starkly with the personal dimension. In joint task-oriented activities, such discrepancies tend to be experienced as inherently problematic and as something that disturbs the rational coherence of interaction (Davies/Harré 1990: 59).

For the purpose of analysing language planning discourses, attention should be drawn to episodes revealing personal or privatised contributions to institutional interaction, as they shape the progress of institutional activity. In order to incorporate this focus into a theory of language policy-planning, we need to expand the definition of language planning as proposed above to differentiate between personal (i.e. private) and institutional levels of contributions, and to highlight the relationships that may exist between these levels on the basis of relevant analytic categories. Bearing institutional and organisational theories in mind (e.g. Drew/Heritage 1998; Grant et al. 2004), we can imagine different scenarios in language policy-planning that seem to provide a fruitful starting-point for such an undertaking. For example, attention could be directed to discursive episodes which reveal subject positioning with respect to activity-bound contributions (especially emphasising the discrepancy between allowable vs. non-allowable contributions). The analysis of such episodes may help determine subjective role awareness or tensions participants may experience in particular circumstances. These scenarios may in extreme cases lead to obvious positioning conflicts which surface in attitudinal behaviour. Alternatively, one might imagine situations in which policy-makers try to eliminate signs revealing personal attitudes that differ from institutional group beliefs (or vice versa). In both these scenarios, we are concerned with verbal (and non-verbal) signals that become active in triggering such tensions during interaction.

## 2.2 *Micro-interaction and the identity sequence*

We would like to conclude our theoretical considerations by discussing briefly some analytic categories relating to the study of attitudinal surface structures and their potential relevance to our focus. Ager (2001) claims that attitudinal structures interact with a set of motives that combine into identity sequences. Attitudinal structures can be measured along three scales: the cognitive (knowledge about language), affective (attraction vs. rejection of language) and conative (readiness to act). The conative dimension constitutes a key element in determining the interplay of the different motives and attitudinal structures (cf. Ager 2001: 141).

Ager (2001: 125-145) connects these three scales to identity 'motives' in such a way as to facilitate the drawing of specific motivational profiles. Using Ager's identity model, we may be able to sequence the language planning process into coherent and more or less self-contained events. Together these events can be interpreted as forming the 'macro-rhetoric' or 'story line' of language planning, such as: identity, ideology, image, insecurity, inequality, integration and instrumentality. This macro-rhetoric can be understood as being triggered by an acknowledgement of inconsistencies within a policy and the need for identity construction.

*Identity* refers to the personal and social identity-building process in a community, when a consistent body of shared beliefs and values relating to language is identified and formulated. The identity-building process is initiated by knowledge about language and by the affective motive that corresponds to the feeling of 'togetherness' as well as the desire to exclude others (Ager 2001: 13). During this identity process, *ideologies* emerge as arguments, strategies or policies, which in turn lead to actions aimed at creating and maintaining a specific real-life *image* of these ideologies. This stage of the planning is characterised by a high motivation to act and defend one's position. When actions result in *inequalities* or social exclusion, the knowledge accumulated about languages/language communities is revised and new insights are *integrated* into the existing policies to improve the planning *instruments*.

We can now revise the positioning triad of language policy-planning by incorporating Ager's identity sequence into the model. Speaker positioning occurs relative to the larger socio-cultural context and situation, but equally in relation to the story lines unfolding from language planning activities. Story lines may unfold at different levels of complexity and abstraction and be present simultaneously in discourse. Discursive episodes can be expected to typically consist of motivational elements within this identity sequence (i.e. story line) and to follow, to some degree, the order proposed by Ager (2001). Episodes can at all stages result in social acts and are constituted by cues and signals in speech marking the joint acknowledgement of all actors involved in interaction.

Obviously it is much easier to measure the interplay of motives and attitudinal structures at group/community than at individual level; it is possible that personal contributions in short social episodes may not fit into attitudinal sequencing patterns at all. Indeed, language planning seems to be surprisingly resistant to micro-level analysis, which explains why it has mainly been examined at group level (cf. also Ager 2001: 158). While Ager's model awaits further refinement, we would like to propose it as a useful and valid starting-point for discursive psychological ventures into language policy-planning. However, one should be cautious not to confuse surface attitudinal

structures with actual linguistic behaviour (Ager 2001: 141); these attitudinal structures at best serve as ‘hinges’ to theorising and operationalising discursive psychological research on language policy-planning activities. In fact, it may be well worthwhile investigating the degree to which the conative power of motives runs counter to expressions of thought during interaction.

Let us, in conclusion, reformulate the task with which researchers setting out to analyse spontaneous speech in language policy-planning discourse are confronted and present a revised definition of language planning that takes account of our interactive focus. Researchers should focus their attention on how motivational impulses of interactants determine contributions to language planning within discursive episodes (micro-rhetorical ‘turns’) and between discursive episodes (macro-rhetorical ‘turns’). By ‘episode’, in this paper, we understand the smallest unit of coherent, cohesive, self-contained verbal or non-verbal contribution which forms part of interactivity between language planning participants and which is embedded in a discursive event. In the context of this focus, our definition of language planning runs as follows: *Language planning is an interactive process arising from and forming discursive episodes and events. It is carried out by social actors who represent different language interests and who position themselves in discourse accordingly. These interests of social actors manifest themselves discursively, i.e. in terms of the social potential the actors attribute to language policy concepts, and in typical attitudinal behaviour reflecting their language identities.*

### **3. The interactive ‘turn’ in practice**

We would now like to apply the model of the positioning triad and the identity sequence to the spontaneous discourse of language planning at the supranational level of the European Union.<sup>3</sup> We would like to discuss two discursive episodes from interviews with language policy-makers in which the interactive ‘turn’ impacted on the language planning process. Our analysis focuses on: 1) unrecognised, i.e. unnoticed, clash between personal and institutional identity, and 2) recognised, i.e. noticed, clash between personal and institutional identity. The analysis will show the discursive dynamics of these clashes during language planning activities and the ways in which institutional discourse can be disrupted by personal motivations. In the framework of this paper, we will limit the analysis to micro-rhetorical turns (i.e. contributions to language planning within discursive episodes).

The two excerpts of natural speech presented below form part of longer interviews with policy-makers involved with language planning at the European level. Current multilingualism policy in the European Union is confronted with a multilingual and culturally diverse socio-geographical context aiming to unite different sovereign nation states economically, politically and culturally. In 2000, the ideological grounds for current multilingualism policy were incorporated by the Lisbon Strategy, which set out

---

<sup>3</sup> The data for this analysis have been collected from qualitative interviews with EU language policy-makers, carried out between June 2007 and June 2008, while also taking into account language policy-planning documents, speeches (esp. by Commissioner Orban) and the history of multilingualism policy-planning in the European Union.

to “make the European Union the most competitive knowledge-based economy in the world by the end of the decade” (COM(2003) 449 final: 3). European language policy, therefore, does not only focus on promoting cultural and linguistic diversity but also on promoting economic competitiveness in relation to and through multilingualism. The main aims of “A New Framework Strategy for Multilingualism” (COM(2005) 596 final) were to encourage language learning (‘mother tongue plus two’) and to promote linguistic diversity (as opposed to English as a lingua franca), to promote a healthy multilingual economy (increased employability and higher international competitiveness) and to give citizens access to European Union legislation, procedures and information in their own languages (linguistic human rights).

The official formula ‘mother tongue plus two’ is seen as the key to becoming a multilingual European citizen. On the one hand, citizens are advised to learn any two European official languages in addition to their mother tongue. On the other hand, the Union is obliged to communicate with its citizens in their mother tongue. In this context, the dominant role of English as a lingua franca poses a problem for multilingualism policy. Although the union promotes the learning of at least two foreign languages, it implicitly aims at motivating citizens to learn other languages than English as their ‘plus two’ languages. This again is a conflict, because it cannot be stated publicly for reasons of political correctness. In other words, current language policy results from macro-political considerations, which are expected to find expression in micro-interaction with language policy-makers.

In the context of our field research, we presented two potentially controversial quotes to policy-makers of the EU as a basis for discussion. These two quotes, extracted from the New Framework Strategy for Multilingualism (COM(2005) 596 final), read as follows:

1. It is this diversity that makes the European Union what it is: not a ‘melting pot’ in which differences are rendered down, but a common home in which diversity is celebrated, and where our many mother tongues are a source of wealth and a bridge to greater solidarity and mutual understanding.
2. Language is the most direct expression of culture; it is what makes us human and what gives each of us a sense of identity.

### *3.1 Unrecognised clash between personal and institutional identity*

The first discursive episode presents the reaction to the first quote by a policy-maker. The clash is motivated by the reading of the quote and the ensuing discussion, in which the respondent first picks up on the diversity concept, but then focuses on the more functional interpretation of the policy ‘mother tongue plus two’. Even though the respondent acknowledges the truth of the statement that language is the most direct expression of culture, he sees it only as “part of the overall picture”. Answering the interviewers’ question, which of the two parts (language as an expression of culture vs. language as a functional tool) might be more relevant to the debate, he states:

A: <L1de> I think i think one does not contradict the other it is not that we should now yeah ah (..) sometimes people do believe when they read things like that ah that we might go against one basic language of communication in practical terms against <L1de>englisch</L1de> NO we say and

then i'll translate from german we'll say that ah ah ah english is good but it's not good enough so that is to say it's fine as a first step but we need to go beyond this now if we look at the reality in europe i would say that we have made some progresses as far as english is concerned ah but we should also be realistic that ah there is still a considerable number of the population which does not speak any foreign language at all </L1de><sup>4</sup>

We would like to apply Ager's macro-categories to this discursive episode. Table 1 tries to divide the discursive episode into different 'turns' representing different steps in the identity formation process.

**Table 1** Discursive episode: unrecognised clash between personal and institutional identity

<i>i think i think one does not contradict the other it is not that we should now yeah ah (...)</i>	• Personal identity → institutional identity (shift)
<i>sometimes <b>people do believe</b></i>	• Ideology
<i>when they read things like that ah that <b>we might go against one basic language of communication in practical terms against &lt;/L1de&gt;englisch&lt;/L1de&gt;</b></i>	• Institutional image
<i><b>NO</b> we say and then i'll translate from german we'll say that ah ah ah english is good but it's not good enough so that is to say it's fine as a first step but we need to go beyond this</i>	• Insecurity (unrecognised clash – affective attitude)
<i>now if we look at the reality in europe i would say that <b>we have made some progresses</b> as far as english is concerned ah <b>but we should also be realistic</b> that ah there is still a considerable number of the population which does not speak any foreign language at all<sup>5</sup></i>	• Defend institutional identity
	• Instrumentality (readiness to act)

The episode builds on the interviewee's suggestion that diversity and the ability to communicate are two important pillars of EU multilingualism policy. However, already in the first sentence: "*i think i think one does not contradict the other it is not that we should now yeah ah*", there is a fluid shift from the personal to the institutional identity, marked by the change in pronouns "I" and "we" respectively. This shift accentuates the policy-maker's identification with the ideology of his institution. The interviewee then continues by shifting his position within the institutional role to an outside perspective to reproduce his assumption of the general belief (ideology): "*sometimes **people do believe***", which in turn constitutes the image of the institution or its actions. At this point, he takes on a defensive position: "*sometimes people do **believe** when they read things like that ah that **we might go against one basic language of communication in practical terms against </L1de>englisch</L1de>***".

With this statement the respondent not only presents his belief concerning the ideology of the general public and the image of the EU's multilingualism policy; but, in this instance, he gives away his own insecurity in connection with his attempt to reject the ideology and the image created by the general public. This becomes clear when analysing the German use of the word 'English' (</L1de>englisch</L1de>), which is the

<sup>4</sup> </L1de> </L1de> marks the first language of the speaker as German.

<sup>5</sup> All emphases are ours.

first language of the interviewee. The rhetorical function of this word becomes clear when we look at the attitudinal structure of this episode.

The German translation of the term 'English' in an otherwise English conversation, in combination with his tone apparent in the recording of the episode, indexes the respondent's affective attitude with regard to the language in question. The insertion of this affective attitude marker in an otherwise cognitive discursive event thus reveals a clash between the institutional and personal identity. This clash can be linked to Ager's notion of insecurity (2001: Chapter 4), which is closely connected to feelings of threat and fear, and puts the contribution in a German perspective, i.e. the perspective of a German native speaker. The referral to the respondent's native language thus emphasises a personal rather than institutional identity, which is otherwise performed through English in this discursive episode.

This personal expression is subsequently transformed into an institutional position: "*NO we say*", therefore defending it against the only just evoked allegations from the public – and his own position. The ensuing elaboration of the policy can be read in the same light and as an effort to undermine the respondent's own former affective insertion: "*NO we say and then i'll translate from german we'll say that ah ah ah english is good but it's not good enough so that is to say it's fine as a first step but we need to go beyond this*".

The respondent proceeds by emphasising in the last phrases of this excerpt the instrumental role of English in language policy-planning, which follows directly from his personal attitude towards English: "*now if we look at the reality in europe i would say that we have made some progresses as far as english is concerned ah but we should also be realistic that ah there is still a considerable number of the population which does not speak any foreign language at all*". Thus, the instrumentality of language planning (EU multilingualism policy) comes to the foreground while the affective side loses importance for this part of the episode.

Summarising, this example clearly shows how one's institutional identity potentially clashes with one's personal identity in specific, critical moments of language planning. The clash can be linked to a spontaneous focus on ideology and insecurity, which is embedded in personalised, language-specific, affective behaviour. The referral to one's native tongue in this context emphasises the relevance of such factors in the interactions in language planning episodes. Therefore, identity formation is shaped by ideological underpinnings, image adjustment and the maintenance – but also defence – of identity on the personal or institutional level. After all, these two layers of identity are intertwined and reflect back on each other. The clear separation but also complete conflation of the two is hardly possible, which is why tensions and conflicts seem an inherent part of social acts pertaining to the language policy-planning-sphere. This possibly problematic process can be linked back to the positioning triangle and the social act and positioning of the policy-maker, which, as was shown, can become contradictory and fraught.

### *3.2 Recognised clash between personal and institutional identity*

In the second example, an extract from an interview with a language policy-maker in an intermediate position, the discursive episode within the interview situation was triggered by a question, which directly addressed the contradictory potential of current

language policy. The respondent's reaction to that question was that, personally, she had great difficulty in conveying the institution's message because it was too imprecise on what exactly it conveyed. The respondent referred her personal difficulty back to her own emotionality and involvement with her work, which seemed to stem from her high institutional commitment.

Q: and ah if you think of multilingualism as a concept as a policy do you see any contradictions that are inherent in this concept is there anything contradictory about it or any aspects of multilingualism that are difficult to reconcile.

A: (.5sec) personally (..) the greater difficulty I have when I try to convey a message at conferences or in any case that we can not say because it does not apply to the situation learn this language or this other lang this is the key to success learn GERMAN LEARN English and don't bother about the rest LEARN because actually the idea is and it is just so difficult to pass the message that [...] it's it's it's like telling people go to the supermarket and buy what you want and actually publicit I mean marketing does that doesn't work exactly this way but this is more I mean maybe I feel it strongly because because I work on this field

Like in the previous example, Table 2 represents an attempt to apply Ager's concept of motivation to this episode.

**Table 2:** Discursive episode: recognised clash between personal and institutional identity

<i>(.5sec) personally (..) the greater difficulty i have when i try to convey a message at conferences or in any case</i>	<ul style="list-style-type: none"> <li>• acknowledgement of identity conflict (personal rejection)</li> </ul>
<i>that we cannot say because it does not apply to the situation learn this language or this other lang this is the key to success learn GERMAN LEARN English and don't bother about the rest LEARN because actually the idea is and it is just so difficult to pass the message that [...]</i>	<ul style="list-style-type: none"> <li>• representation of institutional identity towards interviewers (institutional rejection)</li> <li>• elaboration on institutional image (cognitive activity: reference to institutional ideology)</li> <li>• expressing personal insecurity</li> </ul>
<i>it's it's it's like telling people go to the supermarket and buy what you want and actually publicit I mean marketing does that doesn't work exactly this way</i>	<ul style="list-style-type: none"> <li>• personal interpretation of institutional image (readiness to act)</li> </ul>
<i>but this is more I mean maybe I feel it strongly because because I work in this field</i> <sup>6</sup>	<ul style="list-style-type: none"> <li>• integration of institutional role into personal identity (conflict resolution)</li> </ul>

Unlike the previous example, where the respondent's clash between the personal and institutional identities was left unacknowledged, this second interviewee takes the initiative to elaborate on the clash. Already in the first part, she demonstrates personal insecurity and dissatisfaction with her institutional identity by rejecting the image she has to convey to the public, expressing that "personally" she has "greater difficulty" when she has "to convey the message" representing European Union language policy in official contexts. She shows high preparedness to reject the policy not just in a specific situation, such as a conference where she has to represent the institution, but in "any case".

<sup>6</sup> All emphases ours.

The respondent explains why she has difficulty presenting the policy (“*we cannot say*”). By referring to herself and the institution as “*we*” she demonstrates a high degree of identification with her institutional identity but at the same time adheres to her personal rejection of the institutional image. Through the use of the collective personal pronoun “*we*”, however, she transforms her personal rejection into an institutional position. The respondent continues by criticising the institutional message (ideology) that she has to represent, i.e. encouraging citizens to learn languages without specifying which ones: “*learn this language or this other lang this is the key to success learn GERMAN LEARN English and don’t bother about the rest*”. Here the respondent demonstrates a highly cognitive attitudinal structure when critically evaluating the institutional ideology, revealing awareness of the discrepancy between belief and practice concerning language behaviour in the European Union and in European institutions. In Ager’s words (2001: 127ff), she evaluates the language variety-domain relationship and tries to correlate this with the appropriate language behaviour. Nonetheless, by repeating that “*it is just so difficult to pass the message*”, the interviewee problematises this attempt and displays a high degree of personal insecurity with regard to how she should integrate her personal evaluation into her institutional identity, revealing affective and personal despair with the language policy as such.

In the third part of the episode, the interviewee further emphasises the problem of EU multilingualism policy with a comparison that visualises and dramatises the extent of her conflict. She creates the image of advertising and marketing in a market-driven society (“*telling people go to the supermarket and buy what you want*”), without specifying what products there are to buy. Everybody can picture the image of a supermarket and customers wandering around, not knowing what to buy and why they should buy anything because nobody has sensitized them to possible needs. In this case the interviewee expresses a high readiness to act, indirectly calling for more guidance and structure in cohering with the policy content and in providing a tailor-made message to the people.

In the last part, the interviewee resolves the conflict by drawing back from her explicit expression of despair with her institutional identity. Rather than referring her state of despair about her institutional identity back to the content of the message she has to convey, she refers it back to her state of personal involvement. By saying “*but this is more I mean maybe I feel it strongly because because I work on this field*”, she refers to a personal state of emotionality and demonstrates how much she would like to be able to convey a more concrete message.

It is noteworthy that throughout this discursive episode the interviewee refrains from any personal anecdotes, references to the individual language background or ideology, nor makes explicit suggestions for improvement of the situation. She limits her contribution to a description of the current situation and expresses a personal and emotional problem with this situation by referring this problem back to her being overly involved in her work. In other words, the interviewee takes on the institutional identity, explains her insecurity and difficulty with the institutional role as a personal problem but justifies it at the same time as motivated ‘institutionally’ through her role. Thus, the interviewee signals awareness of this clash but tries to put this awareness into perspective by referring to it as a result of her own emotionality.

#### 4. Conclusion

The aim of the present paper was to draw attention to the micro-level of spontaneous language policy-planning and to outline a theoretical framework with which discourses deriving from spontaneous speech could be studied. We suggested a theoretical framework that was oriented towards the individual policy-maker in the language planning process and which was capable of revealing micro-discursive dynamics of speech *about* language in a professional context. We illustrated the potential of this perspective with two cases that we encountered in elicited conversation with policy-makers of the European Union. The policy-planning process we selected for this investigation was the debate surrounding the concept of multilingualism, which have emerged at a defining moment of European history when the European Union is constituting itself not only economically but also culturally and linguistically.

The discussion of the two cases selected showed that in language policy-planning discourses the clash between institutional and personal identities of policy-makers revealed themselves discursively and surfaced in attitudinal structures. This clash became visible especially when interactants were asked to comment on conceptual inconsistencies in their policies. As was demonstrated in this paper, identity clashes occurred both with and without recognition by the participants. While in the first example the speaker seemed to create the clash automatically during interaction, in the second the clash was acknowledged and problematised by the speaker. The analysis further suggested that language attitudinal structures might be suitable as a model to describe how language policy-planning discourses unfold spontaneously during speech interaction. In the two cases discussed in this paper, the national identity or the identity of a speaker of a certain language seemed to constitute a powerful and potentially subconscious motive in the discursive realisation of the language policy-maker's readiness to act. This was particularly evident in the first example where the speaker's readiness to act and to change the policy situation seemed strongly guided by his emotional disposition towards English and his personal language background. The second example was slightly different in that the conscious reflection of the speaker on current language policies seemed to lead to a rejection of its content on an affective level. In both cases, motives and attitudinal structures went hand in hand.

# **Unplanned Policy: Planned Results**

## **Situating English in the Language Education Policy of Nepal**

**Ram Ashish Giri**

Monash University, Melbourne  
[Giri\\_r\\_a@hotmail.com](mailto:Giri_r_a@hotmail.com)

### **Abstract**

The ruling elites, who have held power in Nepal since its inception in the eighteenth century, have deliberately ignored issues related to minority/ethnic languages in favour of the languages of their choice. While this ‘unplanning’ of languages has been responsible for the loss of scores of languages, it has helped the elites to achieve ‘planned’ linguistic edge over the speakers of other languages. This paper outlines the socio-political and linguistic pretexts of the current policy debate which favours Nepali and English, and explains why English, essential though it is for education, employment and access to world resources, has in the existing situation, done more harm than good.

**Keywords:** language policy, language planning, unplanning of languages, linguistic eliticism, language hegemony

## **1. Introduction**

Nepal, a small nation-state in the Himalayas, has been in the news lately for all the wrong reasons. It is a nation, which is in the grip of a socio-political transition because as the newest republic, it has embarked upon a debate about equitable policies in all sectors of life, and more importantly a debate in which people in the changed political atmosphere advocate for a new social and political order. The paper reiterates some of the issues that are shaping up the debate, in particular the language education policy debate; and by recapitulating historical and political pretexts, outlines how the dominant linguistic groups have conspiratorially ignored language issues to, what Alexander (2004) calls, ‘entrench the domination of the powerful elites’.

The decade-long socio-political turmoil has brought the country to the verge of social as well as territorial disintegration. As various tribal groups fight for their survival, their ethnicities and languages are likely to become one of the reasons for this division. Therefore, Nepal, the Mecca of linguists for its vast linguistic resources is in all sorts of socio-political troubles. And the ‘unplanning’ of the very resources, i.e., its languages, is at the root of all this. By ‘unplanning’ of languages, I mean deliberately avoiding, delaying, and ignoring language related issues, or imposing hidden agendas (invisible planning?) in disguise of nationalism to create and promote language hegemony in favour of the languages of the dominant groups.

In the first part of the paper, I sketch the linguistic landscape of Nepal in which I talk about the historical and political reason why only one of over 100 languages and ethnicities has been dominant since the inception of modern Nepal. I illustrate how by ‘unplanning’ its linguistic resources, the ruling elites have been responsible for the systematic extinction of minority and ethnic languages. I elucidate how they manipulate languages to serve their interest and how they use them to maintain the power structure,

influence public opinion, channelise political energies, and allocate economic resources for the education and promotion of the languages of their choice. Their approach marginalizes the speakers of other languages and unfairly disadvantages them in accessing economic opportunities, resources and employment. It also prevents them from participating in the political processes (Singh, 2007).

The paper takes English as a case study. English in Nepal was imported historically for political reasons, i.e., for using it as a tool to strengthen the socio-political superiority of the ruling elites (Stiller, 1993) and to reserve the access to world resources - economic and educational for themselves. In theory, it has been available to anyone and everyone through public education since the 1950s. In practice however, no rigorous planning of resources and pedagogic mechanism has been worked out for its effective delivery to the average people. For most of the six millions school goers, therefore, proficiency in the language remains underachieved. In this way, the 'un-planning' of English language education (ELE) has been a strategy of the elites to divide the broader Nepalese society. In the second part of the paper, therefore, I situate English in the existing language education and discuss some of the issues, dilemmas and implications on the current language education policy debate in Nepal. In particular, I look into the historical, socio-political and educational pretexts of how English was adopted in the Nepalese education system and how social as well as educational institutions in the current system are structured either to preserve or perpetuate the interest of the elites at the expense of the larger interest of millions of others. I demonstrate how the conspiratorial 'un-planning' of its education has helped achieve the 'planned' results of English becoming a symbol of status, power and privileges, and facilitating the caste/class-based power structure. I argue that by 'un-planning' ELE for the average Nepalese people, the ruling elites have achieved results, which are visible, intended and planned.

## 2. Linguistic Landscape of Nepal

Predominantly a Hindu state in the foothills of the Himalayas, Nepal has linguistically and culturally been overshadowed by two socio-political and economic giants, China and India. A diverse range of Tibeto-Burman and Indo-Aryan ethnicities interplay harmoniously in mountainous Nepal. Ethnographically, therefore, it is a meeting point of the two great cultures blending into diversified cultural and linguistic richness. Nepal, however, has not been able to harness its huge cultural and linguistic resources. In fact, in the period from the establishment of the autocratic *Rana*-regime<sup>2</sup> in the 19<sup>th</sup> century to the *Panchayat*-rule<sup>3</sup> in the 20<sup>th</sup> century, it adopted a policy that regards linguistic and cultural diversity as a threat rather than a resource. The current so called 'democratic' language policy also does not support the development of languages.

As for the current language situation, all three types of language situations, monolingualism, bilingualism and multilingualism exist in Nepal. Languages, both dominant and non-dominant are constructed around the social life of the people of

---

<sup>2</sup> A family of rulers who set up a family rule and reigned Nepal 1848-1951

<sup>3</sup> An authoritarian rule introduced in 1960

different ethnic backgrounds and they influence their choice and use of languages. In this section I sketch the language landscape of Nepal in terms of the users of mother tongues or first languages, second languages and English and describe how their choice of language reflects on their socio-cultural backgrounds.

The 2001 Census identified 92 languages with genetic affiliations to four different language families, namely, Indo-European (Indo-Aryan), Sino-Tibetan, Austro-Asiatic and Dravidian. Indo-Aryan languages constitute the largest group of languages in terms of their speakers. Of all Indo-Aryan languages, 9 languages are spoken as the first languages by over three quarters of the population (76.07 per cent). Nepali, as the first language of nearly 50 percent of the population, is spoken in the hills and in far western mountains, some parts of the Terai and in urban areas. Other Indo-Aryan languages are mainly limited to the southern plains. Numerically, Indo-Aryan languages, therefore, overshadow all other languages. Most Indo-Aryan languages have literate traditions and share a well-developed writing system.

Sino-Tibetan languages constitute the largest number of languages, i.e., 57 of them, spoken by about 18.4 percent of the total population. These languages are spoken in different geographic pockets of mountains and hills. The Kiranti group of languages, for example, is spoken in the eastern hills and mountains; whereas Magar, Thakali, Gurung and Sherpa languages are spoken in the central and western mountains and hills. Tibetan languages are spoken in the high mountainous areas such as Mugu, Dolpa, Mustang and Manang. Nepal Bhasha (also known as Newari) is spoken mainly in the Kathmandu valley. Of these languages, Rai and Limbu in the east, Magar in the central west and Nepal Bhasha in the Kathmandu Valley have been dominant in their respective regions.

Austic languages are spoken by some tribal groups in the eastern Nepal. How they happen to be in Nepal is unknown. However, its speakers have been reported in all censuses. Their number in the latest census stands at 0.2 percent. Similarly, the speakers of the Dravidian languages are settlers in the eastern Nepal and have a genetic connection with some tribes in northern India.

Urban and sub-urban areas are by and large inhabited by the people of mixed-ethnicity. So, Nepali comes handy as a link language. The use of mother tongues gradually decreases in such areas even in family situations as the people live there longer. Families with inter-caste marriage, and people returning to their villages after a considerable lapse of time tend to use Nepali in their villages because its use denotes being educated, economically well-to-do and socially superior. The choice of a second language, therefore, is not constrained by one's ethnicity but by economics and privileges. The people speaking over 57 Sino-Tibetan languages, for example, do not choose a second language from the same language family; but adopt Nepali as their second language conditioned by contact, peer pressure, employment, education and as the quotation below suggests, economic success

Maintaining the mother tongues whether within the indigenous area or outside of it, involves an extra effort, yet it brings no economic advantage. In fact, it may even be a hindrance to fluency and mastery of the prestigious national language. Thus mother tongue speakers of indigenous languages may feel compelled to abandon their mother tongues in order to succeed economically (Toba and Rai, 2005: 21).

In addition, a tendency in non-Nepali speakers is emerging in their language use, that is language shift. There is a decreasing trend in the use of ethnic language and increasing trend in the use of Nepali. Speakers of ethnic languages moving to urban areas for education and employment go through the transition of bilingualism with Nepali increasingly replacing their mother tongue. Similarly, there has been a sharp increase of Nepali speakers in the Terai (southern plain) lately mainly due to the same reason.

The relationship between ethnicity and language in Nepal, therefore, is complex. In a country where the tribe, caste and religion mix is complex, the language-ethnicity relationship can be summarised as (a) one tribe with one language, (b) one tribe with several languages, (c) one religion with one language, and (d) several tribes with one common language.

The majority of the Nepali as the first language (NFL) speakers is monolingual. As it is the language of administration, education, media, business and employment, the NFL speaker neither see any rationale nor do they feel any need to learn other local languages. They have, therefore, no knowledge and regard for the indigenous languages. In fact, they often (?) develop some sort of unfriendly outlook towards and superiority complex over the non-NFL speakers. The Nepali speaking elites, therefore, rarely see the importance of maintaining or preserving local languages. They consider language and cultural diversity as a hindrance and something that prevents rather than aid the development of nationalism. The non-NFL speakers, on the other hand, as a result of the century old linguistic domination and privileging of Nepali, have lost pride in their language, feel discriminated against, and, as Toba and Rai (2005) indicated above, have developed a tendency to neglect their languages in favour of Nepali.

To illustrate the issue further, I would like to present two real life stories. Like millions of young Nepalese, I grew up in a bilingual situation. At home I spoke Maithili, a local ethnic tongue, but at school and neighbourhood, I spoke Nepali. From the very childhood, I was led to believe that 'people are born equal, but some people are more equal than others' and language was an important factor in it. Very soon I realised that speakers of Nepali were different, and that those who spoke Nepali were 'superior', educationally brighter, more talented and more knowledgeable'. And I realised that my mother tongue was less valuable compared to Nepali, and it served no practical purposes other than communication with my parents and relatives. It neither helped me socialise with my fellow Nepali speaking students nor did it provide me the same opportunity, access, knowledge and ability as Nepali did.

The language and cultural divide was more pronounced in the cities than in the villages. When I moved to a city for my higher education, I realised that there was yet another level, another circle and another community of people with bigger and larger access and opportunity for education and employment. And English was their language. In this way, I chose Nepali and English for educational and economic opportunity and social benefits. In the want of becoming a part of broader and wider social and educational community, I abandoned my mother tongue and adopted the languages of others.

Sadly, my story is not unique.

In June 2008 (see Rork, 14 June 2008), a foreign linguist in Kathmandu was stunned to hear a Newar mother who said she did not talk Newari with her husband in the presence of her children lest they might learn it.

“Why is that so?” asked the linguist.

The mother replied, "Well, it's rather nice thing to learn your own language but you know my children will lag behind. English as an international language and Nepali as a communicative language are just fine; another language will make them dull."

The stories above illustrate how millions of the Nepalese people view their languages and why they abandon them. The elites, usually the NFL speakers, consider Nepali as a superior language and employ all political and educational means to perpetuate its dominance. The speakers of dominant languages persevere overtones of dominance because their language background ensures their participation in the national life. The speakers of other languages, on the other hand, are looked down upon, despised and often surpassed in the process of development. As a result, the non-NFL speakers develop an inferiority mindset towards their own languages.

### 3. Historical Pretext of the Debate

Historically, Nepali was imposed as a state language during the unification campaign in the 17<sup>th</sup> century, the purpose of which was to establish linguistic superiority alongside the military superiority. The successive regimes endorsed the policy and enforced it to create a hegemonic control over the minority languages and cultures. The *Rana*-monocracy, for example, infamous for its repressive family rule, introduced what is known as the ‘*muluki ain*’ (the Code of the nation enacted in 1854). The Code in theory was meant for implementation efficiency and administrative reforms. In practice, however, it was used as an administrative tool to promote and strengthen language and cultural hegemony. Writings in, and publication and promotion of any other languages were banned. This divided the people into two categories. The two peoples meant the rulers, and the ruled; the two languages and cultures were the languages of the ruling elites (Brahmins and *Kshetriyas*) and the languages and cultures of all others, the subjugated peoples (Malla, 1979). Nepali was the language of the civilised, educated and enlightened people whereas the minority languages, i.e., languages of the ethnic groups, were ‘the speech of the illiterate’ and ‘the dialects of the jungle’. The policy eventually became a means to repression, intolerance and elimination of pluriculturalism, prompted by ‘racial or caste prejudices’ (Hutt, 1986:6).

The *panchayat* autocracy, established through a political coup in 1960, implemented the language policy through the controversial ‘one nation-one language policy’; to enforce what Hohenthal (1998) calls ‘the linguistic eliticism’. The changing political climate of 1990 provided fresh hopes for a multilingual language policy. However, the reports of the two national education commissions of the 1990s reveal that the government’s position on languages is contradictory. Though the regime softened their earlier position on the use of Nepali as the sole medium of instruction; it made the study of Nepali and Sanskrit (from which Nepali was derived) compulsory in the post

primary level (NEC, 1992); which means that the study of Nepali and its culture remained dominant in the school curricula even in the changed political scenario. The elected government, according to Toba (1992), took no affirmative action regarding the language education rights enunciated in the 1990 constitution except for the fact that it merely allowed the local communities to set up ethnic language schools without any infrastructure and resource allocations. The National Language Policy Recommendation Commission (1994), for example, recommended allowing local and ethnic languages education. However, it did not recommend any models of provision or resource allocation. In fact, the uses of ethnic/minority languages in public domains were severely restricted (Giri, 2007). Therefore, in the complex mix of ethnic groups in the Nepalese society, some local languages ended up being a subject of study rather than a medium of instruction. This means that the actual linguistic impact of the new policy was less than the political impact.

The post-1990 democratic constitutions did nothing against the ‘one nation - one language’ policy. In fact by making some adjustments in the wording in the policy documents, they created what is known as linguistic cynicism to appease its opponents. The critics of the present ‘racist’ (Lawoti, 2004) constitution claim that the present language policy of the government is ‘unscientific and illogical’ (Manandhar, 2002), and question the intention of the key-players involved in the making of the constitution. Lawoti (2004), for example, pointing out the weaknesses in the procedural aspect of the constitution enactment, suggests that almost all members the constitution drafting committee were from the ruling elite (or *parbatiya* Hindus) (Hindus of the hill), and therefore, used the constitution as a basis to promote one language, i.e., *parbatiya* language (Nepali); one religion, i.e., Hindu religion; one community, i.e., the *parbatiya* community, and one culture, i.e. the *parbatiya* culture. This has been a deliberate strategy of the ruling elite to hegemonise the *parbatiya* language and culture and by doing so, the neo-colonial groups colonise the mind of the dominated groups (Dua, 1994).

#### **4. The Current Debates**

In the current language policy debate, there are three schools of thoughts emerging. The first one, advocated by people and parties associated with the left block of politics, is what is known as the nation-state system of governance. In this approach to federalism, a group of people with common language, common culture and common religion has rights to self-rule and therefore to a separate state. A nation, in this sense of the expression, is a federation of several states divided along the ethnic and language lines. These people believe that because the approach worked well in the past, it should work well in developing contexts now.

The second school of thought puts forward the case of state-nation approach to federalism. According to this thought, in the context of heterogeneous society and massive people movement and migration, nation-state approach to federalism is neither feasible nor practicable. Therefore, the advocates of such a system, actually live in the past, and propose so for a cheap political gain. In increasingly multi-ethnic, multicultural and multilingual countries like Nepal, only geographic states can be

created in which people of all cultures, religions and languages have their separate identities ensured through the principles of co-existence, mutual respect and equitable governance. As for the ethnic and indigenous languages, they have sentimental or symbolic value. In today's world of globalisation and competition, local languages neither help nor provide any opportunity. People value their language because they attach them to their identity. So, they are dear to them. Apart from that the local languages do not have any instrumental significance. In fact, they may even bring negative complexes.

The third school of thought, however, advocates for more inclusive politics with concession of autonomy to communities, which are concentrated in certain geographic regions and are capable of making their own socio-cultural and language education decisions. This calls for an educational solution to a political problem. The ethnic and indigenous people want their languages and cultures to be preserved which can be done by allowing them to educate their children in their language up to certain level. The system is formed on the three-language policy in which the local language, national lingua franca, and English as an international language have appropriate places allocated and their roles defined.

## **5. The Importation of English Language Education (ELE)**

The imposition of Nepali and Nepali belief systems has been a major factor in the recent political turmoil (Onesto, 2005). The inequitable distribution of English language education (ELE) has further complicated the situation. During the *Rana* oligarchy English was imported, and adopted as an advantage in favour of the ruling elites (Vir 1988).

The idea of language hegemony was further strengthened with the introduction of English to education in the 1950s when Nepal embarked on planning formal education for the first time. The Government of Nepal, appointed Dr. Hugh B. Wood, a US Fulbright scholar in India, advisor to Nepal National Educational Planning Commission (NNEPC) in 1954 the report of which has had overarching influence on education policy and which became the foundation for language education policy in Nepal. In fact, the Commission's legacy continues in one form or another in 'the construction, deconstruction and reconstruction of Nepal's language policy (Awasth, 2004)

Awasthi (2009, in press), and Cadell (2002) suggest that Wood was heavily influenced by Lord Thomas B. Macaulay, Chairman of the Governor-General's Committee on Education in India in the 1830s. The minutes he wrote during his chairmanship, known as the Macaulay Minutes, are regarded as a historic document on Indian education and the foundation of the Anglicisation of education system in India.

Macaulay's approach to education was what later came to be known as the 'Downward Filtration Model the purpose of which was to filter, select and educate a class of Indians who could function as interpreters between the British rulers and the millions of Indians they governed – a class of persons Indian in blood and colour but English in taste, opinions, in morals and intellect (Edwards 1967). Wood's 'Linguistic Restrictionism (restricting education and use of multiple languages in public domains) theory' and the concept of multilingualism reduction have its direct roots in the

Macaulay's model of education. Wood as the architect of the NNEPC report orchestrated the report to shape the Nepalese language education policy. Therefore, the concept of monolingual Nepal was a non-Nepali ideology imposed on it by, as Awasthi (2004) below suggests, someone with neo-colonial attitude:

... the reduction of multilingualism was not an indigenous construct of Nepal. Linguistic restrictionism was an alien concept for the people and polity, and was an importation from the West. The concept of reductionism grew during the British Raj in India and flourished [in Nepal] after the NNEPC report (Awasthi, 2004: 34).

## **6. English in the Current Language Policy Debate**

The politics of English as a global language is primarily local because while it has to cater to the global demand of the Nepalese people, it must also meet the local socio-political conditions. That is to say, the status and role of English must appropriately be situated in the local language policy debate. However, most of the debate on language policy in Nepal centres around the local languages and no debate seems to occur around English. Whatever debate takes place in relation to the language is limited to curricular and pedagogic matters and distribution of ELE facilities. The non-existence of the debate on ELE at the policy fronts may be because (a) there is reluctance on the part of the people to explicitly talk about politically sensitive issues such as the language issues in the present volatile political climate. Debating the sensitive and somewhat controversial ELE issue is likely to ignite a whole range of socio-political and educational issues for which Nepal is not politically ready, not at the present any way; (b) ELE is not a part of the overall consciousness of the average people; and finally, (c) the people see an undeniable, incontestable and uncontroversial role of English, and therefore, do not see the relevance of debating it.

There is no doubt that English today has established itself as a language of power but more importantly, it has become powerful because it has been used as a tool as well as a resource for social mobility, linguistic superiority and educational and economic benefits. English as a language of power, therefore, manifests itself in the following dimensions: demographic, socio-political, and economic.

### *6.1 The demographic dimension*

There has been an unprecedented spread of English across sectors and regions in Nepal. English is increasingly used as the main lingua franca, overtaking Nepali, in crucial sectors like tourism, trade and business, education, science and technology, and most other economic sectors:

As the process of globalisation ... is in effect all over the world, Nepal cannot withstand it. English has been a language, which seems to be replacing Nepali itself (Rana, 2006).

It is not only the ruling elites and the politicians who mix a great deal of English in Nepali in their conversations, ordinary rural populations also have developed some sort of taste in doing so. English has become one of the dominant languages in mass (print and electronic) media (Pokharel, 2003, p. 1). 25 percent of news dailies are in English and with all print media combined (i.e., dailies, weeklies, and fortnightlies and monthlies), 40 percent of all materials are published in English and the number is increasing (Humagain, 2001, p. 69). This illustrates that the spread of English in Nepal across sectors and regions is rapid and systematic. It has in recent times reached the lower strata of the population and in suburban as well as rural regions

### *6.2 The socio-political dimension*

English is often termed as the ‘prestige’ language in that it brings prestige and respect for anyone who speaks it irrespective of their class or caste background. The English language is almost sacrosanct in the sense that people equate modern education with English education. So much so that there is a great drive towards learning English and educating children in the English medium schools at all costs:

*Ma petkater bhayepani chhoralai angreji iskuulma padhuchhu [I would rather skip meals to be able to afford English medium school for my son} (a low-caste housemaid during an interview in 2006).*

At the politics level, the decision makers have always been confused between the political aims and the economic aims of teaching English. That is to say, they have had no clear understanding of what they prescribe and what is actually needed for the average Nepalese people. On the one hand, the government have always, since its introduction, imposed uniform ELE curricula at all levels of education, on the other hand, however, it has never ensured that the facilities and resources are distributed in a uniform manner. At the same time when everyone is questioning the relevance and effectiveness of the government’s universal, compulsory ELE program, it has, against all the odds, introduced English for all in Year 1 (Standard 1).

As a consequence of the uniform ELE curriculum and pedagogy, there is a huge discrepancy in the standard of ELE in the country. Furthermore, it encourages private English medium schools, which, because of its exorbitant fees, are only attended by the children of the rich families. The two-tier education system and the inequalities between the private English medium schools on the one hand and the Nepali-vernacular state-run schools on the other, have created two types of citizenry – of those who have adequate proficiency in English and therefore access to education, employment and opportunity as a result, and those who do not.

### *6.3 The economic dimension*

English is at the heart of all economic success. Whether it is a simple housemaid’s work or tourist guide’s, or whether it is teaching in a private school or establishing own business, English is an indispensable aid without which, as an academics says below, success is only an illusion:

People who know English are more exposed, more knowledgeable and therefore, more successful in life than those who don't. Without English, there is no academic or occupational future (a professor during interview in 2006).

English has reached a stage in which it monopolises education and employment at all levels and of all types. Officially, there is little change in the attitude towards English. In fact it remains as it was stipulated in the 1950s when it was incorporated in the formal education system fulfilling the role of a power language and language of the elite. At the practice level, however, it has consolidated its position in both *de facto* and *de jure* manners. English medium schools and colleges have contributed to the development of ELE in a *de facto* fashion, and requirements of English in every curial sector of life have legitimised its importance. The average people view English as an economic liberator, progress, prosperity and status which does not only provide a competitive edge, but also aids people with a global perspective or experience, an essential aspect of any regional and international economic ventures. In the recent times, therefore, there is a drive in the Nepalese people to be economically successful, but what drives the economic success is the success in leaning English.

## **7. Issues from Situating English in the Language Education Policy**

In theory, as indicated earlier, English is a foreign language in Nepal. In practice however, it is the main language in most technical disciplines, private education system diplomacy, research and academic activities, and certain economic sectors such as tourism and trade and business. It is the second most important language for the educated Nepalese people, higher education, administration, media and military. In the wake of globalisation, English is replacing all local languages (Rana, 2006).

This unspoken privileging of the language is a deliberate attempt to create a further division in already divided Nepalese society. The language has been used as an instrument by the elites to maintain their superiority (Stiller, 1993). The role this language has played in the community has, therefore, been controversial, and in the absence of a clear state policy for its education, the language has done more harm than good. It is not only creating a socio-cultural and linguistic chaos, it also contributes to emotional and social displacements which together may be termed as cultural anarchism (Giri, forthcoming).

Furthermore, Nepal appears to be working with the fallacy that monolingual governments are more efficient than multilingual governments; and that multilingualism always divides and monolingualism always unites. As a consequence, instead of producing constructive policy, the fallacy has created problems and counterproductive issues. In this section, I describe some of the issues and tensions that arise from the current language education policy approach of Nepal.

### *7.1 Non-integration of the speakers speaking other languages*

The common cause of the tensions among different language communities is the governments' stance, either in theory or in practice, about the mainstream languages. When people want to be integrated like items in a salad bowl, they are made to assimilate like ingredients in a melting pot causing insecurity, injustice and inequality in the ethnic/minority communities. The integration policy aimed at social transformation is creating tension because speakers of ethnic/minority languages are discriminated against those of mainstream languages such as Nepali and English. Similarly, the goal of making Nepali a language of all Nepalese people remains underachieved as it has not yet become a common language for many indigenous ethnicities. As a result, those who do not speak the languages do not integrate well in the mainstream life.

### *7.2 Policy Contradiction*

The policy regarding languages and how they are put to practice are also a source of tensions. There is a contradiction between the official policy or official position regarding languages, and the actual linguistic practice. For example, Nepal encourages only Nepali to be used in public domains restricting minority languages to limited social and private domains. Despite multilingual language policy rhetoric in the current political discourses, Nepali and English dominate the practice of all other languages. There is no concrete plans for promoting their use in the public domains.

Furthermore, there is a contradiction between the political aims and economic aims of ELE in Nepal. The academics recommend a compromise between the aims by suggesting that English should not be taught until after the elementary level of education as in the lack of adequate resources and teaching conditions, the ELE goals remain underachieved. Introducing it at a later stage of education will enable the government to be better prepared in terms of resources (both human and material), infrastructure and teaching conditions. The government, however, in the name of equity in education, has introduced it in Year 1, which without adequate plans and resources is merely a ritualistic exercise.

### *7.3 Politicising language policy*

Keeping language policy free of party politics has been a major issue in multilingual countries. Despite promised autonomy of policy making bodies, language policy making has been subservient of the ruling political parties which exert their ideological and political influence on the policy-making process as well as the product. For the Nepalese political parties, language policy is like political manifestos, in which they manipulate, perpetuate and promote their linguistic interest. The pro-Nepali politics comes from the people of the *parbatiya* group who promote Nepali as the language of the *pahades* (the hill people). The promotion of Nepali as the dominant language, therefore, means the extension of the dominance of the *parbatiya* community on all Nepalese people, which then paves way for Nepali language and culture to be placed above all others.

There is thus a lack of political will and lack of a consensus among the political actors and ruling elites to distance themselves from the narrow ideological/political conscience and work for a broader interest of all sections of the population.

#### *7.4 Aligning languages in term of their socio-political and economic relevance*

One other source of tension is the way indigenous/community languages are treated, prioritised or aligned for education, use and preservation. There is a tendency in Nepal to align languages in terms of socio-political rationale. For example, languages of socio-politically dominant communities have been selected and given space in media, education and to limited extent public domains leaving at least several dozens of languages in their own fate. Governments and social elites, therefore, channel away resources and energies into learning of these preferred languages instead of researching, investing, and maintaining the vast linguistic resources for their linguistic, cultural and human potentials.

#### *7.5 Declining parity of esteem of ethnic languages and falling mother-tongue education*

Privileging of English and Nepali has also resulted in declining parity of esteem of ethnic and indigenous languages. Though the current policy allows administrative sanction and limited economic support of certain level for the education of some ethnic languages, there is no statute to protect and support their legal status. With the diminishing educational and economic value, the people of young generation do not value their languages at all. As a result, these language communities are gradually losing their speakers.

For the Indigenous Nepal, mother tongues and their education have been their priority because 'it is only by knowing our language; we can make progress in all fields of life' (says an ethnic language teacher). However, this is simply a rhetorical statement. The existing mother tongue schools are experiencing a decline of students because they do not see any relevance of knowing their language. In recent years, a significant amount of interest has been shown especially by the people of tribal groups to educate their children in their local language, i.e., mother tongue. A dozen of mother-tongue education schools are in operation in various parts of the country (Yadava, 2005). This supposedly maintains their languages. However, the ethnic groups themselves point out the fact that the knowledge of the local language does not have the same value in employment, trade, media and education as English or Nepali. Inclusion of English (and Nepali) in mother tongue education, therefore, has been viewed necessary without them education in the ethnic languages alone is neither possible nor practicable (Eagle, 2000).

#### *7.6 English: One Language – Multiple Literacy*

There is a contradiction between how the elites view English and what the common people expect of it. There is a sharp contrast in the role they perceive of the language. The ruling elites, for example, are avoiding the issue and are content with the current arrangement because the discriminatory access to English helps maintain their

status quo. The academics have always recommended that English cannot and should not be compulsory for all at all levels of education (Davies, 1984; Malla, 1977). The common people, on the other hand, inspired by the current situation, expect that English must be for all, available at all levels and for all sections of the population. For them, English is a 'social capital', and like all other capitals, it must be carefully planned and 'fairly distributed'.

The status and role of English, irrefutable they may be in the Nepalese contexts, are far from clear. It is not clear, for example, how a uniform teaching and learning policy can address the complex population diversity and their diversified needs. Based on geography and the different economic activities people are engaged in, there are surely different needs requiring different levels of English proficiency for different types of populations. It needs to be ascertained who needs what type and level of English and how this is to be accomplished. However, the current debate only reveals that the place of English in Nepal is unassailable and it must form an important part of any educational package. What it does not address is the fact that different sections of the Nepalese population require different types/levels of English and therefore, English must be treated differently for them.

English language education, therefore, faces the dilemmas of social equity, social division and equitable practice. Academics and educational experts, for example, believe that ELE has to be based on the reality of the situation, and taking into account the fact that different sections of populations need different types and different levels of English, and that while English is 'second language in urban areas', it is the third or even fourth language in the rural and remote areas of Nepal, the English language must be treated differently in different parts of the country. This means that there has to be different literacy targets for different types of population. However, fair though it sounds, it creates a policy contradiction as it denies the same level of opportunity and excess to all.

## **8. Conclusion**

Languages in Nepal have been conspiratorially manipulated to serve the interest of the dominant groups of the society since the very formation of Nepal in the eighteenth century. The elites have deliberately ignored the issues related with the minority and ethnic languages. The 'unplanning' of English along with these languages has helped them have a linguistic advantage, and competitive edge over others, and better access to education employment and economic success. It has also helped them maintain the dominance of the languages of their choice.

English Language Education (ELE) in Nepal is, therefore, at the crossroads. Its hegemonic past, its deteriorating standards in public education, its divisive role in the community, and uncertainty of its future on the one hand, and on the other its ever growing demand in all socio-economic and developmental domains is creating a policy contradictions. What is needed is a policy framework, which gives ELE a definitive course and develops a policy that adequately accords a place for English along with other local languages, and recognises its role in the socio-economic and educational development of Nepal.

# Language Policy in Germany and Beyond

Wolfgang Viereck

University of Bamberg  
Obere Dorotheenstr. 5a; 96049 Bamberg/Germany  
wolfgang.viereck@uni-bamberg.de

## Abstract

In Germany and Switzerland the world-dominion of English was already predicted in the 19th century. While today the impact of English on German has alarming consequences for many, English lexemes often fill a welcome gap in the language. The role German politicians play in the German vs. English debate can at best be called ambivalent. The part they played in the discussions about the reform of the orthography of German, on the other hand, is strongly negative. The paper concludes with remarks on the language policy of the European Union.

**Keywords:** English in German; Konrad Duden, the Nazis, today's politicians and the orthographic reform of German; Globalisation and languages; European Union language policy.

## 1.0. English in German

Remarks on language policy in many countries today must necessarily also include comments on the impact of English on those languages. This was also the case in the past. Jacob and Wilhelm Grimm as well as Jacob Burckhardt were great names in the intellectual world of 19th century Germany and Switzerland respectively; the first two were philologists and the second a historian. As early as in 1874, Burckhardt had already predicted the coming world-dominion of English with the alarming consequence: "The only way to rescue books written in German is to translate them into English" (translated from German). 135 years later, statistics prove the dominance of English also in book production. In 2000 German-speaking people translated 5,519 books from English, whereas English-speaking people translated only 248 books from German. Although due to the general decrease of book titles translated into German the number of books translated from English also decreased, namely to 3,611 in 2005, but with 65% the translations from English were far ahead of other languages, such as French with only 10%.

Even a quarter century before Burckhardt, Jacob and Wilhelm Grimm expressed a specific misgiving about German in Chapter 6 of their *Deutsches Wörterbuch*: "It is the duty of linguistic research and, specifically, of a German dictionary to oppose the immoderate and unfounded penetration of the foreign word" (Grimm & Grimm 1854-1971, translated from German). A philologist called Grimm's dictionary a Pyrrhic victory of Germanistics. By opposing the foreign word, it was argued, words such as *Kultur* were missing in the dictionary. Such reproach, however, must be modified: The volume that was to contain the word *Kultur* only appeared in 1873, that is ten years after Jacob Grimm's death and fourteen years after the death of Wilhelm Grimm. It was for linguistic reasons that Jacob Grimm called English a world language (1864: 293).

I shall not deal here with the influence of English on German from a historical perspective (on these aspects see Viereck 2004). Indeed, since the Second World War the impact of English on German has assumed such dimensions that every attempt to record it fully becomes futile. As one might expect, mostly Americanisms occur and particularly in those areas that are connected with technical innovations, such as information technology or new technology, which is abbreviated as IT or NT in German publications (and of course, refers to the world of computers). Other fields include telecommunication from whence we get *Handy*, a pseudo-loan for English *mobile (phone) or cell(ular) phone*, youth culture (pop music), economics, fashion, science, politics and advertising. Of course, the English influence must not only be seen negatively. Anglicisms often fill lexical or semantic gaps in German and there are numerous cases where they are to be preferred for stylistic purposes as they convey American or British colour, precision, brevity, vividness, tone or simply variation of expression.

When a German equivalent cannot be found soon afterwards to replace it, then the English word will stay. Often the English word is shorter. Small wonder with a language where such linguistic monstrosities exist as *Steuervergünstigungsabbaugesetz* ‘law on the abolition of tax rebates’, or *Eierschalensollbruchstellenverursacher* ‘a device used to create breaking points in egg shells in order to allow one to easily remove the top part of an egg without causing the shell to splinter’ (Limbach 2005: 157), a matter of amazement or ridicule at least since Mark Twain (1880). Such recent English additions as *Mobbing*, *Dialler*, *Skimming* or *Phishing*, an artificial word created from *password fishing*, will no doubt not be translated into German. Yet in very many cases the use of English words in present-day spoken and written German is excessive, unfounded and thoughtless and it is quite natural that this meets strong opposition especially from those people who do not know (enough) English. A number of language societies exist in German-speaking countries today which publish lists from time to time of unnecessary Anglicisms with their German equivalents. The following table reproduces excerpts of such a list, which altogether comprises 2,000 words put together by members of the association “Muttersprache” in Vienna:

Loanword	Suggestion for rendering in German	Number of Synonyms
<i>Bar</i>	Schantisch, Schankstube, Schank, Tresen, Schenke, Alma mater alcoholica*	6
<i>Box</i>	Schachtel, Pferdestand, Montageplatz (car)	3
<i>Boom</i>	Hochkonjunktur, Blütezeit (economy)	2
<i>boomen</i>	blühen, wuchern	2
<i>Camping</i>	Zelten, Fahrt-	2
<i>clever</i>	klug, schlau, gewitzt, gerissen	4
<i>Container</i>	(Groß-)Behälter	1
<i>Diskette</i>	Speicherscheibe, Merkring*	2
<i>Dock</i>	Werft, Schiffsbaustelle	2
<i>Dress</i>	(Be-)Kleidung, Gewand	2
<i>Drink</i>	Trank, Trunk, Getränk	3
<i>Fair</i>	gerecht, ausgewogen, unparteiisch	3
<i>Festival</i>	Fest(spiel), Feier(spiel), Film-, Musik-,	

	Theaterfest	5
<i>fit sein</i>	in Form, gesund sein	2
<i>Fitness</i>	Gesundheit, Kraft, Ausdauer	3

(Muhr 2004: 41)

Several comments must be made with regard to this table. First, the number of German lexical equivalents for the 15 English words is 2.8 on an average. That means about three German words are necessary to render the content of an English loanword. This certainly cannot be called a facilitation of communication. Second, words marked with an asterisk (*Alma mater alcoholica* for *Bar* and *Merkling* for *Diskette*) are new creations, and are simply ridiculous. And finally, Muhr (2004: 41f.) shows that some of the German equivalents are inaccurate (those for *Dock*, *Boom*, *Drink*), as they do not render the content of the English word correctly and some are simply wrong (those for *Dress* and *Container*), as their range of meaning is too general. As becomes evident, some of these language societies do themselves a disservice. They “care” about the German language in such a way that they feel obliged to translate or render almost every Anglicism into German with sometimes ridiculous or inaccurate results. Cases in point are *Hingehet* for *Event*, *Klapprechner* for *Laptop*, *Prallkissen* for *Airbag*, *Denkrunde* for *Brainstorming* or *Nachsteller* for *Stalker*. Yet there are also cases where the suggestions should be supported, especially by journalists propagating them in their daily work. Of course, these puristic procedures have a long tradition in German-speaking countries. As is the case today, they have always found their staunch supporters and their fierce opponents.

## 2.0. The Role of the Politicians in Linguistic Matters

Only since very recently have German politicians taken a more active part in discussions about linguistic matters than they had done in the past. Unfortunately, some of their remarks are simply outrageous. In late 2005, the Prime Minister of Baden-Württemberg, one of the 16 states of the Federal Republic of Germany, pleaded on German TV for English to become the working language in Germany, whereas German should remain the language of the family, of leisure time and of the private sphere in general (Paulwitz 2006: 7). In this regard, he was “his master’s voice” and simply reiterated the views of the dominant big industry that strongly favours globalisation.

The politicians’ disregard for their mother tongue is also noticeable in Germany’s cultural policy. Up to last year the annual budget of German cultural institutions had been curtailed every year. In 2003 alone this led to the closing down of five cultural institutions abroad. Ironically, at the same rate as the globalisation folly grew, the German government cut down the financial means to teach German abroad. Whereas the government did not care enough – at least until 2007 - to maintain German abroad and to push the status of the language in international organizations, it showed an abstruse interest in the reform of its orthography with equally abstruse consequences to which I would like to turn now.

### 3.0. Duden, the Nazis, today's Politicians and the Orthographic Reform of German

In 1880 Konrad Duden, then director of a secondary school, published a slim volume entitled *Vollständiges Orthographisches Wörterbuch der deutschen Sprache* [Complete orthographic dictionary of the German language]. He accomplished something that has not been accomplished ever since, namely uniformity of spelling. Duden was very careful with standardizing the orthography; in 1901 he only abolished the *Th*, for instance, in *Thür* 'door' following the Prussian model, that has since been written without *h* and he noted in 1902: 6 "If one had wanted to introduce a thorough reform, one would have lost the ground under one's feet" (translated from German). The vision of so-called German thoroughness, however, remained. Linguistic societies, philologists and poets alike developed systems of their own – often with the use of small initial letters.<sup>1</sup> In 1920, a committee even advocated a "thorough phonetic reform". However, nothing happened until the Nazis came to power. Their plan, far beyond reforming the orthography of German, had a perfidious logic: In order to enslave a people one only had to shatter its cultural pride. The most effective way to do this was to disturb the people's linguistic self-confidence. A complete change of the orthographic system would lead to the downright upsetting of historical consciousness and to the devaluation of the writings of earlier times. Georg Schmidt-Rohr, a linguist who was head of the department of the sociology of language of the SS - the so-called "Schutzstaffel" of the Nazi party (Simon 1986) - , to whom we owe these "insights" was probably thinking of Turkey which had changed to the Latin alphabet in 1928. In any case, he thought something similar could be introduced in occupied eastern Europe. A new orthography for Ukrainian would set in motion a linguistic splitting up of the Russian empire, while in Poland, he thought, a new orthography could break up the Polish people's strong sense of history (on these aspects see Birken-Bertsch & Markner 2004).

However, the linguist's thoughts were not able to win over the Nazi bureaucrats – as some of them pursued similar aims, ironically for German itself. Of course, it was not called a breach with tradition which it actually was, but rather a "national awakening". The new, quite radical rules for the orthography of German were only published in 1944, fortunately too late to have any impact. At Hitler's request thousands of booklets had to be pulped. Yet the same people who worked out the rules for the Nazis continued their work after the war. In 1954 they published demands that were almost identical with those of 1944. For these people, as for some linguists today, orthography is the visible expression of language – if words are pronounced the same, they ought to be written the same. A present-day Swiss linguist formulated: "When someone reads something written, then (s)he transforms it to sound" (Saltzwedel 2004: 162, translated from German). However, if reading were to proceed like this, weeks would be needed to get through a daily paper. All these arguments are nothing but a justification for interfering with a well-established orthographical system and for prescribing new rules.

In 1996 a new attempt was made at reforming the orthography of German. The Ministers of Culture of the 16 German states decreed that the new rules should become compulsory for German schools and for those working in the civil service by August 1, 2005. However, it soon became clear that this was not likely to happen

without many changes. Millions of euros have been invested since 1996 in producing new dictionaries and school books. The Ministries of Culture exerted intense pressure on school book publishers threatening that if publishers remained critical of the orthographical reform no school books would be ordered from them any more. This threat did not remain without effect. In 2004, the new *Duden Rechtschreibung* appeared in its 23rd, completely revised and extended edition. It was reviewed in a leading German daily, the *Frankfurter Allgemeine Zeitung*, under the title “Das unmögliche Wörterbuch” [The impossible dictionary] (Ickler 2004). Some of the strangest rules were abolished there and new ones introduced following a decision of the Ministers of Culture taken in June 2004. The 24th edition of the *Duden Rechtschreibung* followed only two years later. It is quite clear that these changes made all the dictionaries worthless that had appeared between 1996 and - at least - 2004. Authors of literary works never followed the new rules, the daily paper just mentioned, soon reverted to the old spelling and punctuation again and two of Germany’s largest press publishers followed suit. In an opinion poll carried out in September 2004 only 11% of the population were in favour of the reform, 60% were against and 29% were undecided (*DER SPIEGEL* 43, 18 October 2004: 50).

When the politicians installed a Council of German Orthography in October 2004 they saw to it that the opponents of the reform were in the minority. The work of this Council remained patchwork, also because the ministers had decided beforehand what should be dealt with. Aspects of the reform that in their view were not controversial were banned from any discussion. Thus many shortcomings remain, which I cannot deal with here. Problems mainly concern the use of the hyphen, capitalisation, punctuation and the tricky area whether words are written together or separately. Ickler (2006) documents many strange results. I would, however, like to mention one example from the section on how words should be divided: according to the *Duden Fremdwörterbuch* of 2001 *Teenager* can be divided not only as *Teen-ager* ‘a boy or a girl between the age of about 13 and 19’, but also as *Tee-nager* which, taken literally, means ‘a gnawing animal which lives on tea leaves’! This nonsensical division was rectified in the subsequent eighth and ninth editions of the *Duden Fremdwörterbuch* that followed each other in an exceptionally short interval of only one year. All this shows how wise Konrad Duden was over one hundred years ago when he introduced only very few changes in order to preserve uniformity of spelling. The majority of the members of the speech community must find new rules sensible, otherwise they are not prepared to follow them. Decrees alone do not work any more. In the area of German orthography, at least, we find today a “collective disobedience”. There are now two ways of spelling: one of the ministers of culture and one of the people beyond school age and outside the civil service. Almost all German publishing houses today have their list of orthographic exceptions, an altogether impossible situation. This is what happens when politicians meddle in matters in which they are not experts. Rominte van Thiel draws our attention to another unbelievable consequence of the orthographic reform, namely the destruction of culture in German school libraries. She sums up the current situation by saying: “I do not know whether apart from the burning of the books by the Nazi 75 years ago there has been another ‘sorting out’ of books from libraries in Germany to the extent as is happening now” (2008: 4, translated from German).

#### 4.0. Globalisation and Languages

I have already mentioned the globalisation folly. *Globalisation* is a fairly new word. According to the *Oxford English Dictionary* (1989) it was coined in 1961; in the early 1990s it appeared as *Globalisierung* in German. Languages belong to the most important victims of globalisation. The unity of the market, the uniformity of its actors and the monotony of its language form the “survival-kit” with which its survival is ensured. It is, thus, in an unfortunate way consequential that with the increasing globalisation process the interest of the German government in maintaining German abroad diminished. The linguistic norm is English: *one world one language*. This linguistic unitarism is part of an ideology that reduces a complex sociocultural reality to such an extent that a simple “rational” action becomes possible with quick decisions. The only concern of the present-day global players is: How can the unitary language English be imparted to the new generation as early as possible and with the least possible expense? As already noted above, the people for whom this trend is so advantageous have the power to enforce such developments.

#### 5.0. European Union Language Policy

As an option for Europe and as a perspective for the world, multilingualism opens new ways and offers possibilities other than a world-wide uniformity. Let me continue and conclude with some remarks on the language policy of the European Union. On a supranational level, the preservation of European multilingualism has in principle been the aim of the European language policy ever since the 1950s; it is part of the European peace policy. After all, linguistic rights are human rights. The European Union quite consciously propagates a policy of multilingualism, not of bilingualism, because the preservation of many languages means the promotion of individual multilingualism and not of individual bilingualism. Those who are “only” bilingual, who know their mother tongue and English as a second language, tend to enforce the one foreign language they know as the only valid one; in the end they push forward a leading language policy. On the other hand, multilingual speakers who speak more than one foreign language attribute importance also to other languages, not just to one lingua franca. That is why the white book of the European Union postulated that every citizen should master three languages of the Community. That was also the demand made for the “European Year of Languages 2001”. This is the theory, which is nothing but a blue-eyed illusion. According to an opinion poll published in 2001, 47% of the population in Europe spoke no foreign language at all. However behind this average value enormous national differences are hidden ranging from 66% in the United Kingdom over Austria with 48% to Luxembourg with only 2%. In the Scandinavian countries the percentages are relatively low and in southern Europe relatively high.

Also the practice in inter- and supranational communication alone shows that reality differs widely from these self-imposed ideals. The European Council which propagates multilingualism uses only English and French as working languages and largely ignores German which with almost 100 million native speakers comes in first place in the European Union.<sup>2</sup> The same is true of other institutions, for example, the

WEU (Western European Union) in London, the EFTA (European Free Trade Association) in Geneva, the ESA (European Space Agency) in Paris and the broadcasting stations in Geneva.

Thirty-eight percent of the population of the European Union are of the opinion that it will be inevitable to have a common language for the internal communication of the European Union, especially after the enlargement of 2004 – as of January 2007, the European Union counts 27 member states -, but 47% are against that. How the 38% would react should they no longer use their own language, remains to be seen. According to these and other results the single leading language model does not seem to be feasible at present, not even for the internal communication of the European Union.<sup>3</sup> A policy of multilingualism, on the other hand, can only succeed with a conscious language policy and language planning. A laissez-faire policy that leaves the linguistic development to the laws of the so-called free market will in the long run lead to the monopoly of a single lingua franca, namely English. For the British government and the British Council this situation will, no doubt, have a most welcome economic effect, as has been the case up to now. The language issue in Europe is politically so sensitive that the politicians prefer to agree only on bland and fine-sounding platitudes in their policy white papers – statements which Phillipson (2003) dismisses as “EU rhetoric”. Regrettably the European Union has failed to consult the experts. What happens when language issues are left to the politicians on a national level has already been pointed out above. What is badly needed is a neutral European language policy. This debate should also include a discussion of the pros and cons of the use of the neutral planned language Internacia Lingvo, commonly known as Esperanto. Esperanto, for instance, facilitated the communication of the reconciliation talks between Korea and Japan. Also, the fairly new field of eurolinguistics is called upon here to work out a concept of multilingualism that by strengthening communication within and beyond single language families relativizes the absolute dominance of English. Such alternatives deserve to be seriously pursued.

## Notes

<sup>1</sup> See, for instance, an advertisement of Eomund (1907), in Waas (1967: 18), claiming that as soon as a child can pronounce the sounds of German clearly and is able to read, he/she will master orthography perfectly.

<sup>2</sup> In 2003 55% of the documents were published in English, 44% in French and only 1% was published in German. Consequently efforts are now being made on the German governmental level to introduce German as a third working language of the European Union and to place German on the same footing with the other two languages as a language of publication. The German daily *DIE WELT* noted that the German Parliament threatened to deal with European Union documents only when they reach Parliament in German (21 April 2006: 4). Two years later the Commission in Brussels refused to have these documents translated into German (*DER SPIEGEL* 12, 17 March 2008: 20). German politicians ignored far too long to put the status of their language on a par with both English and French on the European level and now it seems to be too late for that.

<sup>3</sup> According to a current opinion poll carried out in Germany only 13% of the Germans favour a common language in the European Union.

# **Crafting multilingual and intercultural identities in talk: I know a little about your language<sup>1</sup>**

**Erica Zimmerman**

United States Naval Academy  
589 McNair Road, Annapolis, MD 21402  
[zimmerma@usna.edu](mailto:zimmerma@usna.edu)

## **Abstract**

This article examines how the participants indicate multilingual memberships when engaged in talk about Korean language use. Talk about language use occurs when participants engage in talk that indicates that they are teaching/learning about a specific form and/or telling about how language is used. Typically, the introduction of Korean into a conversation involved the participants engaging in metalinguistic talk to make comparisons about the differences between the Japanese and Korean languages. Through this process, the participants construct identities, such as engaging in expert-novice roles and constructing multilingual speaker identity. The analysis will show that the participants are making comparisons about languages which construct various intercultural identities and show when and where the talk led to those occasions.

**Keywords:** Interculturality, Korean learners of Japanese, Identity, Conversation Analysis

## **1. Introduction**

This article will examine how the participants indicate multilingual memberships when engaged in talk about Korean language use. Talk about language use occurs when participants engage in talk that indicates that they are teaching/learning about a specific form and/or telling about how language is used. This was a fairly common subject among the participants and their interlocutors for both Japanese and Korean in this study. While there were occurrences of talk about language that focused purely on the use of Japanese by the participants in this study, this article will focus on occurrences where the use of Korean language was the main topic. The main reason for this is that these forms of talk about language also tended to invoke the participants' intercultural memberships.

Typically, the introduction of Korean into a conversation involved the participants engaging in metalinguistic talk to make comparisons about the differences between the Japanese and Korean languages. The participants then engaged in making comparisons, which led to the construction of mutual understanding about the language form in question. Through the process of making a comparison, the participants constructed various identities, such as engaging in expert-novice roles and constructing multilingual speaker identity. The analysis will show that in this case, the participants are making comparisons about the languages and in one case, indexes the stances of "I know a little about your language." The co-construction of their identities in talk as expert-novices led to indicating the participants' multilingual memberships as well. This article will explore when and where the talk led to those occasions to discover how the participants managed these intercultural moments.

## 2. Language expertise in interaction

One way to construct the identity of multilingual speaker is through orienting to expert-novice roles in conversations. The terms “expert and novice roles” originates from a reaction to the use of the classifications of native speaker and non-native speaker (Cook 1999; Firth & Wagner 1997; Kachru & Nelson 1996; Kasper 1997, 2004a; Rampton 1990; Schegloff, Koshik, Jacoby, & Olsher 2002). These researchers highlight that the field of second language acquisition imported the terms native and non-native speaker from Chomsky’s terminology as a way to categorize participants. Many researchers do not question the use of the categories native and non-native speaker; rather they accept these categories as unproblematic. However, Cook (1999) argues that the terms of native speaker, non-native speaker, and L2 learner are problematic because many researchers have essentialized their meaning, by assuming that the native speaker norm is the goal for L2 competence. In addition, many researchers do not account for the variables in a learners’ competence such as native speakers of one language having the ability to use another.

To avoid essentializing and assuming a speaker’s identity as a native or non-native speaker, Rampton (1990) suggests that researchers utilize the term expertise for categorizing participants. Expertise implies that the expert’s knowledge is not innate; rather participants can acquire or demonstrate his/her expertise through interactions with others. However, the demonstration of expertise in conversation is not symbolic of a speaker’s social group identity (Rampton 1990). This definition avoids the stereotypical understanding of what it is to be a native speaker.

In response to this debate, Conversation Analysis (hereafter CA) researchers’ main criticisms are that any category assigned to the participants prior to examining the talk, rather than seeing how the participants construct identity in conversation is problematic. That is, many non-CA researchers assume that, because the speaker is a non-native speaker, s/he will behave in interactions in a certain way such as making grammatical and pragmatic errors. Recent CA studies have addressed this issue of the categorization of participants as native/non-native identities versus expert/novice in the analysis of discourse (Carroll 2000; Hauser 2003; Hosoda 2002, 2004, 2006; Ikeda 2005; Kasper 2004a, 2004b, 2006; Koshik 1999; Mori 2002, 2004; Wong 2000a, 2000b, 2000c). These studies show that, on occasion, participants orient to their differential linguistic and cultural expertise. However, CA researchers tend to differ in the categories utilized for describing this identity work. Some have categorized the participants in the native-non-native speaker dichotomy (Hauser 2003<sup>2</sup>; Hosoda 2002, 2004; Ikeda 2005; Wong 2000a, 2000b, 2000c). Still others have used the terms expert-novice (Carroll 2000; Hosoda 2006; Kasper 2004a, 2004b). These later studies avoid the terms native and non-native speaker, because they believe that it is not the participants’ social identity as native or non-native speaker that is being orientated to. Rather, the participants are demonstrating differential language expertise (Kasper 2004a).

Hosoda (2006) exemplifies this form of analysis for Japanese with her study on repair in conversations among users of Japanese. She argues for the use of the terms target language expert and target language novice over native and non-native speaker, by demonstrating how language expertise is achieved as a part of the ongoing interaction. To arrive at mutual understanding, participants in conversation will engage in repair sequences when necessary. In segment 1, the participants engage in repair work for

*shigoto kankei no ryokou* ('work related travel').

**(1) Segment 1. From Hosoda (2006, p.20-21)**

**[Dean: L2 Japanese; Toku: L1 Japanese]**

1. Dean: *ano:: sigoto kankei no ryokou wa?*  
uhmm work relation Gen travel Top  
  
'Uhhh, how about work related travel?'
2. Toku: *nn? kankei?*  
Huh relation  
  
'Huh? Relation?'
3. Dean: *a:: sigoto kankei ryoukou a a ano (.) ryoukou zya*  
uhmm work relation travel uh uh uhm travel COP
4. *naku te ano tch e:: nihongo de wa wakan nai kedo*  
Neg and well tch uhm Japanese in Top know Neg but
5. *((cough)) (.) ano::: Osaka: e:: [ka Nagoya e::]*  
uhmm Osaka to or Nagoya to  
  
'Uhhh, work relation travel, uh, uh, uhm, not travel  
but well, tch, uhhh, I don't know {the word} in  
Japanese but uhhh, to Osaka or to Nagoya.'
6. Toku: *[ah syuttyou]*  
oh business trip
7. *desu ne.*  
COP:POL IP  
  
'Oh, you mean a business trip.'
8. Dean: *syuttyou aa SYUTTYOU.=*  
business trip oh business trip  
  
'Business trip, oh, business trip.'
9. Toku: *=syuttyou.=*  
Business trip  
  
'Business trip.'
10. Dean: *=hai. [°syuttyou°]*  
Yes business trip  
  
'Yes, business trip.'
11. Toku: *[u:::~:~:n] syuttyou wa desu nee,*

Hmmmmmmm business trip Top COP:POL IP  
*imanotokoro yotei nai desu ne.*  
for the time being plan NEG COP:POL IP

‘Hmmmmmmm, as for a business trip, for the time being, there is no plan.’

In segment 1, the roles of expert and novice are demonstrated through the repair sequence. Toku has trouble understanding Dean’s question which is signaled by the other- initiated repair in line 2. Dean attempts to self-repair in line 3 and elicits help, which is followed by Toku’s other-initiated repair in line 6. Dean accepts the other-initiated repair (line 8), and eventually the participants return to their original discussion (line 11). This sequence displays that the participants are seeking mutual understanding of Dean’s question.

Segment 1 is a typical example of an expert-novice interaction. This study will adopt the terminology of expert-novice when the participants orient to differential language expertise and will show that the multilingual identity can also be constructed. The use of the categories of target language expert and novice avoid the stereotyping that arises with the terms native and non-native speakers. That is, non-native speakers are always deficient in their language production.

As the analysis will show, there are many places in conversations where the participants are not concerned with linguistic errors. Previous expert-novice studies (Carroll 2000; Hauser 2003; Hosoda 2000, 2004, 2006; Wong 2000a) have typically focused **only** on the repair sequences as a demonstration of the roles of language expert and novice. This article will show that the expert-novice roles are just part of the complex identity constructions that occurred in my data when there is “talk about language.” This article will include more of the interaction than is typically provided in similar studies. This will allow for an analysis of the additional identity work that occurs in the interaction, such as a multilingual speaker identity and the interculturality of the participants.

This article will answer the following questions:

1. How does talk about language play a role in the participants’ negotiation of their identities?
2. Does this provide an opportunity for an orientation to interculturality, and if so, what occurs?

The analysis examines two areas: code shift and non-code shift events. The first example will demonstrate when the participants code-shift to engage in talk about language and indicate the identities of expert-novice and multilingual speaker. The participants accomplish the construction of the stance of “I know a little about your language.” The second example will demonstrate that the participants are engaging in talk about the Korean language without using a code-shift. Despite the lack of a code-switch, one of the participant’s indicates her orientation to her intercultural statuses. However, the participants’ sequential moves shift the talk away from further engagement in talk about language use. For both of the segments, the analysis will demonstrate how the participants’ orient to the category of multilingual speaker and on occasion the formation of intercultural understanding.

### 3. Data and Methodology

This article examined two segments from 45 hours of data, produced by two of the participants, Ji Eun Han and Mi Ran Na. The data was recorded in the Chubu area of Japan with other speakers of Japanese. The participants used mini disk recorders and the researcher was not present. These two segments are just two of many similar segments where the participants engaged in talk about language.

This study used a Conversation Analysis informed perspective for analyzing the data for the construction of identity following the seminal works of Sacks (1972, 1979, and 1992) and the collection of works in Antaki and Widdicombe (1998). Identity is defined as how participants display their orientations toward others in the talk to indicate their relationships and identities (Antaki and Widdicombe 1998). The basis for analysis is the use of Membership Categorization Analysis (MCA). MCA is the examination of the process of organizing and reorganizing people into categories or groups in conversation (Sacks 1992). Antaki and Widdicombe’s (1998) work propose three analytical practices in which identity can be examined. E. Zimmerman (2007) designated these practices as labeling (explicit categorization), description (formulating a category) and “doing” identity. The analysis for this study focuses more on how the participants are accomplishing the identities of expert-novice and multilingual speakers in the talk.

### 4. Code-shift in “talk about language:” Pronunciation comparisons: It sounds like...

This section will show when the participants are working together to work out the use of a Korean language form. This leads to the participants indicating their understanding of how this form works and engaging to “teach/learn” about a Korean phrase. The participants create a space for negotiating language similarities and differences to indicate that they want to know a little about another’s language. The analysis will demonstrate that, in addition to the roles of expert-novice, the participants accomplish further identity work for that of multilingual speakers.

Segment 2 involves a phonological comparison of what a language form sounds like to one of the participants. Ji Eun Han is a main participant, and she is talking with her friend. They are at a Korean restaurant and have just received their order. In the 25 seconds before the beginning of the talk in line 499, a song that contains the phrase *EMMA YA*<sup>3</sup> begins. We can hear clicking of silverware on the plate and chewing throughout the segment.

#### (2) Segment 2. Ji Eun Han MD 7 Track 2 (JH=Ji Eun Han A=a female friend)

498	(25.6) ((song starts in this pause and can hear sounds of them eating and serving up food))	(25.6) ((song starts in this pause and can hear sounds of them eating and serving up food))

508	A:	<i>un, E[MMA YA.</i>	'uh-huh, E[MMA YA.'
509	JH:	<i>[EMMA YA, honma ya. [un un un.</i>	'[EMMA YA, honma ya. [uh-huh uh-huh uh-huh.'
510	A:	<i>[sonna fuu ni kikoeru EMMA YA okaa no</i>	'[(I) hear it that way "EMMA YA" ((means)) mother?'
511	JH:	<i>soo soo. [okaasan?</i>	yes yes. [mother?'
512	A:	<i>[soo yatte itton chau?</i>	'[(you)) say it that way right?'
513		(0.3)	(0.3)
514	JH:	<i>un.</i>	'uh-huh.'
515		(0.3)	(0.3)
516-517	A:	<i>honma: ya tte kikoeru no? hehehe (0.6) honto da to iu.</i>	'I hear it as really ((honma ya, Osaka dialect)) hehehe (0.6) to say really ((honto da, Standard Japanese))'
518	JH:	<i>un.</i>	'uh-huh.'
519		(2.2) ((during this pause, the singer of the song says EMMA YA again.))	(2.2) ((during this pause, the singer of the song says EMMA YA again.))
520	JH:	<i>EMMA YA.</i>	'EMMA YA ((Korean))'
521	A:	<i>un un.</i>	'uh-huh uh-huh.'
522		(9.4)	(9.4)

Segment 2 demonstrates one strategy for making pronunciation comparisons between two languages or dialects. Ji Eun Han and participant A orient to participant A's status of knowing about Korean, the Japanese Standard dialect and the Japanese Osaka dialect. In this segment, Ji Eun Han poses a question in response to a phrase of a song that is being played in background at the Korean restaurant they are eating at.

The segment begins in line 499 with Ji Eun Han directly questions participant A's knowledge of the Korean term EMMA YA ('mother'). Participant A's response in line 501-502, is a pronunciation comparison between EMMA YA ('mother') and *honma ya* ('really,' Osaka dialect). She provides the standard Japanese pronunciation for really (*honto da*) and then the Osaka dialect version. She then claims that the *honto da* is Korean. A 1.3 second pause occurs between this and the next line of talk. This pause is significant in that it indicates that something is not quite right. What follows shows this. Participant A provides a self-initiated self-repair that it is not Korean and then further clarification that it is Osaka dialect. However, this is not enough to fix the possible confusion as indicated by Ji Eun Han's response, which is a second question in line 506 as to whether in Osaka dialect they say EMMA YA. This question is a move for further clarification and denotes Ji Eun Han's confusion with participant A's previous utterance. In line 510, participant A reiterates that she hears EMMA YA as *honma ya* clarifying her position. It is immediately following this that there is an indication that participants finally arrive at a

shared understanding of the meaning in lines 510 and 511 when A suggests that EMMA means *okaa* ('mother') in Japanese and this is confirmed by Ji Eun Han.

The identity construction in this segment is complicated because the identities of expert-novice and multilingual speakers are happening simultaneously. As far as the expert-novice roles are concerned, the two participants share this role. Participant A attempts to show her expertise in lines 501-502 by providing a comparison between the two languages. However, she had to self-repair when she made a mistake in the language she was referencing. The role of expert shifts to Ji Eun Han in line 511 after a question from participant A requests confirmation of the meaning of *EMMA YA* with *okaa*. In this example, it is not a matter of a non-native linguistic disfluency that leads to repair. The repair occurs with the "native speaker." Thus, the expertise constructed here is for comparing language forms in two languages.

In regard to the other identity constructions that occur in this segment, participant A constructs the identity of multilingual speaker for Ji Eun Han by asking for confirmation about the meaning of *EMMA YA* in line 510. Participant A is demonstrating that this is how she hears Korean and therefore Ji Eun Han's language. The identity of participant A is also constructed as a multilingual speaker of two dialects. She not only compares Osaka dialect and standard Japanese despite the repair that occurs in line 502, but she also provides her perspective as to how she hears *EMMA YA*. Through this exchange, the two participants are sharing their respective languages indicating their intercultural memberships. The comparisons of the languages indicate the participants' orientation to arriving at an understanding of the words under discussion. The participants' multilingual speaker identities are made relevant as a part of the comparison making process. In the end, the participants construct the moment as intercultural by showing that "I know little about your language."

## 5. Comparing Japanese and Korean without a code-shift: Talk to move away from talk about language

In the previous section, the analysis explored ways in which a code shift and pronunciation comparisons between Japanese Osaka dialect and the Korean language became the focus of the interaction as a means to discover more about Korean. In turn, various identity constructions evolved from that talk, such as multilingual speaker and expert-novice. This section will also focus on how comparisons are made, but this time, there is no code-shift to a Korean word that occurs. The analysis shows that while one participant wants to move to talk about linguistic practices, the other participant avoids this by indicating his lack of interest. In segment 3, Mi Ran Na and her male friend are driving in her friend's car. Participant B, the male friend, is driving and Mi Ran Na is the passenger. The two participants start to talk about snow after seeing the freshly fallen snow on the ground outside the car window.

### (3) Segment 3. Mi Ran Na MD 11 Track 2 (MN=Mi Ran Na, A=Male friend)

55	MN:	<i>sooka: (0.9) sonna ni tookunaka- [tta</i>	'I see: (0.9) it wasn't that fa[r]
56	B:	<i>[(soo-) yuki ga</i>	'[(yeah-) snow'

Before getting into the analysis of what the participants accomplish here, an explanation of the differences that Mi Ran Na brings to the floor is necessary. Both Japanese and Korean have borrowed Chinese characters (Kanji for Japanese and Hanja for Korean) and a Chinese-like pronunciation for some words. The original Chinese pronunciation in both Korean and Japanese was adjusted to fit the respective languages. South Koreans have for the most part stopped using the Chinese characters except for a few instances such as the print media and names, but the pronunciations remain a part of the language. In Japanese, the word for snowball fight is *yukigassen* (雪合戦) which means in English snow war or battle. Mi Ran Na provides the non-existent word of *yukigenka*, (‘snow fight’) which is the Japanese pronunciation of what she proposes would be the Korean way of constructing the word with Chinese characters. If this were a word, it would be the following characters: 雪喧嘩. The Figure 1 shows a representation of these words.

<b>Snowball Fight</b>	
雪合戦	雪喧嘩
<i>yukigassen</i>	* <i>yukigenka</i>
snow battle	snow fight
(Japanese word)	(Non-existent word in Japanese)
	눈싸움
	<i>nwun ssa wum</i>
	Snow fight
	(Korean word)

Figure 1. Snowball fight

The talk about language here stems from what was seen outside the window of the car (fallen snow). Participant B suggests that they could make snowmen (*yukidaruma*) in line 59 to which Mi Ran Na seeks confirmation of what she had heard in line 63. This exchange is an example of novice seeking confirmation from an expert about a word. From here, participant B proposes another possible snow activity, *yukigassen* (‘a snowball fight’). At first, it appears that Mi Ran Na, as the novice, is seeking confirmation of that word too as seen by participant B’s interpretation and response of *soo soo* (‘yes yes’) in line 69. However, this is where the participants transition from a confirmation check to an instance of a clarification check. Min Ran Na indicates she needs further clarification by asking a question that seeks out why the term is not formed in another way in lines 71-79. She tries to create another opening for an expert-novice exchange about language in line 79 with her reference to Korean’s use of a word that means snow fight. While participant B at first shows interest with his response of *a soo na no?* (‘is that

so?') in line 82, participant B makes clear his indifference about engaging in these roles with a disaffiliative move in line 88 with *docchi demo ii janai?* ('either is okay right?'). In response, Mi Ran Na questions this indifference in line 89. He responds however in line 91 with *anmari kodawari wa nai yo.* ('I won't dwell on it.'). This disaffiliative move thus, shifts the topic from the debate over terminology to things participant B will dwell on.

Thus, the two participants engage for a brief moment in metalinguistic talk when Mi Ran Na brings up the differences between the conceptualization for the compound for snowball fight in Japanese and Korean. Her suggestion for how the word is said in Korean brings to the forefront of the conversation her identity as a Korean speaker. Participant B in response provides a disaffiliative move indicating his indifference and shifts the topic. Mi Ran Na does not challenge this shift in topic and complies by engaging in this new topic. The identity constructions in this segment differ from the previous segment where the two participants mutually engaged in the exchange to discover about the other's language. In this case, Mi Ran Na constructs herself as a multilingual speaker who is trying to find out the differences between Korean and Japanese. However, participant B sequential indicates his unwillingness to engage in the topic and does not work to further explore her identity as this multilingual speaker. Participant B avoids engagement in talk about lexical conceptual differences. While participant B does not work to construct his own interculturality, Mi Ran Na constructs their intercultural differences through this comparison. Participant B's shift to another topic avoids further development of this potential intercultural topical talk.

## 6. Conclusions

These two segments, while both involving talk about language, resulted in different outcomes. Ji Eun Han and her interlocutor arrived at a shared understanding for the term they were discussing. Mi Ran Na and her interlocutor did not pursue finding an answer for her question. There could be a couple of reasons for this. In segment 2, the word in question is a real word that is compared to another real word. In segment 3, however, Mi Ran Na is asking her participant to engage in talk about word that does not exist in Japanese. For him, this is not a matter for pondering because the words are just different. Thus, their talk ends up being redirected to a more concrete topic which is the act of dwelling on something. This is an area that participant B can comment or is willing to comment about because Mi Ran Na is remarking about his personality. Thus, one possible reason for the different results here is the type of word that is being compared. In both segments, the participants construct their expertise and multilingual identities. The outcome of the talk however is shaped by the participants' uptake of the topic.

This analysis demonstrates that more than just expert-novice identities can be constructed in topical talk about Korean language pronunciation and usage. In segment 2, the participants created a space for a pronunciation comparison between Japanese and Korean constructing the multilingual identity as a salient aspect of the talk. The participants' conversational activities for talk about language indicated an exchange of intercultural information and provided an opportunity for the speakers to have an intercultural moment. The talk indicates that the participants are engaging in discussions that broaden their understandings of the language, their cultures, and each other. However, as shown in segment 3, the Japanese participants did not always take up the topic of talk

about language and display interest in the other's language. Instead, the participant B successfully redirects the talk to a topic he will engage in. While the main participant's identity as a multilingual speaker is made salient for a moment, the two speakers do not pursue the topical talk that could develop further intercultural understanding.

The analysis shows that for Ji Eun Han and Mi Ran Na, it was not the non-native status that was relevant for these interactions. Instead, the participants construct, through various conversational practices, the identities of expert-novice, multilingual speaker, topic avoider, and intercultural identities. The talk about language in these two segments indicates that the participants engaged or attempted to engage in discussions that could broaden their understandings of the Korean language. As segment 3 showed, this activity can be sometimes redirected to avoid the topic altogether.

The implication of this study reinforces that researchers must look carefully at the participants' joint productions of identities as produced within the sequential moves of the talk. These findings also suggest that the process of constructing one's identity does not stop at the repair sequence. If the analysis had stopped there, the complex identities that followed would not have been discovered. It also demonstrated that there are various agendas for the talk (segment 2, an intercultural moment, segment 3 avoiding further engagement in intercultural talk). In addition, it also shows that the assumption of identity as found in many identity studies, especially in intercultural situations, could lead to stereotyping and misdiagnosis of the identities constructed by the participants.

Further research is needed in the area of language expertise to discover other ways in which the expert-novice roles can be activated. In this case, the talk about language was one avenue which led to indicating the participants' intercultural memberships. The participants can work to discover more about each other and the target language under discussion through talk about language.

## Abstract

The eminent status of EAGLF—an acronym of English As a Global Lingua Franca—is often talked about in relation to a threat to linguistic diversity and linguistic inequality between the English-native and English-nonnative worlds. EAGLF is a product of globalized discourse in the ubiquitous age; that is, the rapidly spreading availability of the Internet requires a common language, which, from geographical-historical and socio-cultural reasons, appeared to be English. Ironically, however, the ubiquitous age equipped with advanced information technologies should be able to realize AUTOLINGUALS—another form of global lingua franca, that of computers. It is this cyber lingua franca that will possibly replace EAGLF. After all, we confirm that linguistic diversity is part of human nature.

**Keywords:** EAGLF, AUTOLINGUALS, three Ds of linguistics—diversity, disparity, and divide

## 1. Introduction

The advancement of worldwide communication systems has given rise to a now familiar expression, the ubiquitous society. The ubiquitous society is expected to realize the world knowledge and information accessible to anyone, anytime and anywhere on the globe, provided that the society acquires some common language. From geographical-historical and socio-cultural reasons from the 19th and 20th centuries, English is the language which has achieved its eminent status as a global language (Crystal 1997). This has raised several issues concerning phenomena of attrition and death of minor languages on a global scale, often, though not always, triggered by English as a *killer* language (House 2003).

This paper argues that EAGLF—an acronym of English As a Global Lingua Franca—is a necessary linguistic product of the ubiquitous age. Ironically, however, there will be another form of global lingua franca, that of computers, to be made possible by the ubiquitous age. Given such a technological reality, to be called AUTOLINGUALS, a threat due to English should be diminished, and linguistic equality should be largely realized. The paper confirms that linguistic diversity is part of our universal human nature.

## **2. Three Ds of linguistics—diversity, disparity, and divide—in the ubiquitous age**

### *2.1. Technological ubiquity and language*

The notion of *ubiquity* is often used in terms of the universal availability of today's advanced information technologies. The ubiquitous society, in particular, characterizes today's globalized world interconnected via advanced information technologies. When the ubiquitous society is properly realized, we will be able to enjoy a number of advantages brought by the technologies anytime and anywhere on the globe. While this is the technological side of the ubiquitous age, there is another side that is linguistic in nature. Language and the advanced communication network technologies go hand in hand; they are inseparable from each other. Without language the advanced technologies cannot function. In other words, the ubiquitous society is not a genuine reality until we acquire necessary linguistic means, that is, some *common language*. From geographical-historical and socio-cultural reasons from the 19th and 20th centuries, English appeared to be most representative of such common language (Crystal 1997).

### *2.2. Linguistic diversity, disparity, and divide*

Language is human species-specific, which implies likeness and *diversity*. This is evidenced by the fact that there are more than 6,000 languages currently spoken in the world (cf. Comrie, et al 1996) and that these diverse languages are governed or regulated by coherent patterns (cf. Haspelmath, et al 2005). Out of such *linguistic diversity*, English has achieved its eminent status as a global lingua franca in nearly all areas of human activities (Crystal 1997), including academic conferences, economic activities, international politics, data base, and the media. This is an undeniable fact of today that raises the issue of *linguistic disparity* against the nonnative English world. That is, the

nonnative English world must spend tremendous amount of social cost for English, most obviously time and money. The more the eminent status of English advances, the more is spent on mastering English. This is what is happening in the nonnative English world.

### *2.3. Disparity in social cost on English education*

As globalization proceeds, countries in the nonnative English world are investing tremendous amount of social cost on English education. Take Japan as an example. English has virtually been a mandatory subject of higher education (high schools and universities). Recently English has been seriously considered to be taught much earlier, and it is about to become a subject of elementary education. English is a subject of nearly all high school and university entrance examinations. This makes it a major subject taught in numerous preparation schools throughout the country. Even out of school, English remains a big subject. After schooling, business men in international corporations are required to achieve scores of 800 on the TOEIC for promotion. Before schooling, teaching English to preschool children has become a current fashion. The bookstores throughout Japan confirm such circumstances; various education materials for English occupy great deal of their floor spaces.

More serious is the controversial issue coming up repeatedly among opinion leaders since Mori (1873), that English be Japan's official language. Related to this tendency is Shiga (1946), who spoke for the use of French in place of Japanese. Recently the government advisory committee *Colloquium: the 21st Century Japan's Scheme* has proposed that English be the Japan's second official language.

One estimate reports that annual social cost spent on English is never under 30 billion dollars in Japan alone. Such a situation is more or less a reality in many nonnative English countries. The burden is clearly on the nonnative English world. It is obvious that *linguistic disparity* exists today between the native and nonnative English worlds.

The issue of disparity also exists within the nonnative English world. This is because not all countries can afford such tremendous social cost on English education.

### *2.4. Disparity in achievable English competence*

Even if they can afford the social cost, it is unrealistic to expect that the nonnative English world achieves a level of competence similar to that of the native English world.

If English is taught early enough, powerful bilingualism may be achieved, and we may expect it to be a possible solution for linguistic disparity. However, this may even be questionable, as we see in the report from California Spanish-English bilingual education, that only 6% of the Spanish speaking children enrolled in bilingual classes made it into classes then taught mostly in English and that everyone seems to agree that bilingual education did not work very well (ABC World News Tonight 6/1/1998). Note that this story is from one of the English native countries where people use it in everyday life. We may easily imagine then how hard to gain English competence in the nonnative English world, which is comparable to native speaker's competence.

### 2.5. *Linguistic divide*

Linguistic disparity does not seem to disappear easily. It is obvious that a disadvantage is toward against the nonnative English world. In other words, the ubiquitous society using English as a common language will institutionalize differences in social class outlook between those who have good access to English and those who do not; hence *linguistic divide*, which refers to divide in such a social outlook.

### 2.6. *A chain of three Ds of linguistics*

We see here a linguistic chain of three Ds. A fate due to *linguistic diversity* is *linguistic disparity*, from which *linguistic divide* is induced. A chain of *diversity, disparity, and divide* seems to remain a recurring problem in any issues of globalization (Katada 2002), if no solution comes forth.

### 2.7. *English as a threat to multilingualism*

In short, the importance of learning English keeps increasing, and the world is often concerned about English driving other languages out of existence (e.g. House 2003). Though English is not the only cause of language extinction, some estimate that a half to three-quarters of the existing human languages will disappear in this century, and a backlash is certainly beginning (Crystal 2003).

While such a concern can be well understood (e.g. Nettle and Romaine 2000), I suspect and propose another possibility. That is, the importance of solid knowledge of one's own language be increased; inversely lessened be the importance of learning English. As a result, linguistic equality be largely realized, and multilingualism be saved

accordingly. Section 3 will provide the logic behind this claim.

### **3. The emergence of AUTOLINGUALS**

#### *3.1. EAGLF*

English as a global lingua franca is a product of the ubiquitous age. That is, the rapidly spreading availability of the virtual universe of the Internet has required a common language, which appeared to be English. EAGLF—an acronym of English as A Global Lingua Franca—has now gained its own functions and characteristics distinct from ‘English’ per se. We should first note what EAGLF is all about in the ubiquitous age.

Briefly, EAGLF is a product of globalized discourse in the ubiquitous age. It is supposed to be a means for allowing indirect communication between any language pair (X, Y); EAGLF mediates between language X and language Y, schematically:

(1) Lang X – EAGLF (English-based) – Lang Y

Ironically, however, the ubiquitous age, equipped with advanced information technologies, should be able to realize another form of global lingua franca, that of computers, to be named here AUTOLINGUALS. This will make the story interesting.

#### *3.2. AUTOLINGUALS*

AUTOLINGUALS is another necessary byproduct of the ubiquitous age. Just like EAGLF, AUTOLINGUALS is supposed to serve as a means for allowing indirect communication between any language pair (X, Y), schematically:

(2) Lang X – AUTOLINGUALS (technology-based) – Lang Y

This is not a mere illusion or dream. Among notable technologies advancing day by day reported by Japanese major newspapers are the Universal Networking Language developed by the UNL project at the United Nations University in Tokyo. This is an example of global lingua franca of computers whose aim has been to handle any languages of about 180 countries and areas of the world. When it is satisfactorily

developed, it will no longer be a dream that papers written in French are directly read in Swahili on Internet (The Nikkei 1997).

Portable multilingual automatic interpreters with listening (and speaking) competency are forthcoming at ATR (Advanced Telecommunication Research Institute) in Kyoto (The Nikkei 6/30/1999). This will be a genuine breakthrough for real time language processing.

The ongoing and promising exploitation of wearable computers (The Nikkei 4/25/2003) allows us to feel convincing that the emergence of affordable, portable machine interpreters and translators—AUTOLINGUALS—is deterministic in nature.

For those who are suspicious about the emergence of AUTOLINGUALS, just remember the now widespread cellular phones equipped with incredibly sophisticated functions including those of motion camera, TV, e-mail, and even Internet. Only some years ago, many people did not expect such sophisticated portable communication tools.

### *3.3. AUTOLINGUALS for place of EAGLF*

EAGLF and AUTOLINGUALS perform a very similar function; they both mediate between any language pairs and allow their indirect communication. From a user's point of view, however, they differ in an important respect. EAGLF, on the one hand, is English-based and burdens the nonnative English world since it must spend a tremendous amount of social cost on acquiring English. Today linguistic inequality in terms of social competition is a reality. AUTOLINGUALS, on the other hand, is a machine language, and once satisfactorily developed, it will bring linguistic equality to the world since no user must learn any languages of others. In the ubiquitous age, we may expect AUTOLINGUALS to replace EAGLF.

### *3.4. The need of interlanguage*

Can we then totally depend on AUTOLINGUALS? This question led us to testing of currently available primitive forms of AUTOLINGUALS such as a few translation software packages available at computer shops. The experiment was to see the level of linguistic sophistication of AUTOLINGUALS. We let the software translate Japanese expressions to English and translate the English outputs back to Japanese:

(3) Japanese (Input) → AUTOLINGUALS → English (Output)  
Japanese (Output) ← AUTOLINGUALS ← English (Input)

The expectation should be that the input Japanese and the output Japanese be close enough semantically and being reasonably legible in terms of lexical choice and grammar. This expectation was not borne out. The answer to the above question was negative.

The result was not surprising since AUTOLINGUALS is not a human brain equipped with complex working knowledge of language, despite the belief of scientists that anything humans can do, machines can do. The experiment indicated the following. To obtain reasonably legible results, there are certain forms which better feed into AUTOLINGUALS. A user needs to assist AUTOLINGUALS by providing paraphrases with grammatical clarity maximized and context-dependency minimized. These paraphrases may be called *interlanguage* for AUTOLINGUALS, akin to that introduced by Selinker (1972) for second language acquisition. Schematically,

$$(4) \text{ Lang X (Input)} \rightarrow \text{Interlanguage} \rightarrow \text{AUTOLINGUALS} \rightarrow \text{Lang Y (Output)}$$

(X-based)                      (machine lang)

In the above schema, there is no English involved, though English may be X, one of the source languages, or Y, one of the target languages. Since interlanguage is based on one's own language, in order to maximize the faculty of AUTOLINGUALS, the user must have a solid conscious knowledge of his/her own native language.

In principle, then, under the emergence of AUTOLINGUALS as an alternative form of global lingua franca, the importance of English would be lessened, whereas the importance of one's native language education would be increased. In other words, AUTOLINGUALS will be a possible solution for linguistic divide caused by linguistic disparity.

#### 4. Linguistic diversity as universal quality of human being

Effects of AUTOLINGUALS on three Ds of a linguistic chain is worth noting. Disappearance of linguistic disparity entails disappearance of linguistic divide. In schema (5) a chain between diversity and disparity is cut, and disparity and divide chained together will disappear. What would survive persistently in the end is linguistic diversity.

$$(5) \text{ Diversity} - \text{ } \rightarrow \text{ } - [\text{Disparity} - \text{Divide}]$$

It is worth noting in this respect that, because of its overwhelming success, English is diversified into many dialects that are mutually unintelligible. These dialects may evolve into independent languages. Representative are Ebonics, Spanglish, and Shinglish, among others, whose characteristics are often pleasantly astonishing.

Ebonics spoken in African-American communities in the U.S.A. has African importation of grammatical features. Stress affects meanings as in (6).

- (6)a. She been married. (she used to be married)
- b. She BEEN married. (she is married now)

It also has some grammar which 'standard' English does not have. For example the absence of 'be' indicate a momentary state, where as its presence transforms the meaning to a conventional state, as in (7).

- (7)a. He here. (He is here right now)
- b. He be here. (He is always here)

Spanglish spoken in Hispanic communities in the U.S.A. is another example. Spanglish is a blend language evolved by codeswitching between Spanish and English.

- (8) All right, all right, *recordando una bez mas*, tomorrow night .... Its gonna happen, *en el parque Rosdeo* .... Tejano, Thunder! Accordions burn! Be there. Yes, *mananapore Rosdeo* .....

The last example is Shinglish spoken in Shingapore where, in addition to Chinese, Malay, and Tamil, English has been used as one of the official languages. Shinglish has Chinese and Malay importation of duplication. The following examples are from Honna (2002).

- (9)a. If you go to Seiyu, everything is cheap-cheap.
- b. I like to wear big-big.
- c. Play-play, no money. Work-work, no leisure. Combination is better.
- d. Choose-choose-choose-choose-choose, no buy.
- e. Thursday, can-can.
- f. My friend from China, she likes (to) shop-shop.

These are all examples of diversity emerging in the process toward unification. It is certain that a recursive chain of uniformity-diversity is part of universal human nature.

## 5. Conclusion

To live the globalized world brought about by the advanced communication technologies, we must have a good linguistic preparation, that is, a common language out of *linguistic diversity*. Under the eminent status of English as a global lingua franca, identified as EAGLF, the *linguistic disparity* (disadvantage) is clearly toward the nonnative English world. What is entailed is *linguistic divide* between the two worlds, that of English native and that of English nonnative.

Ironically, however, it will also be the advanced technology that might free the nonnative-English world from the linguistic divide. The solution suspected in this paper is a technological reality, AUTOLINGUALS, an alternative form of global lingua franca of computers. AUTOLINGUALS is claimed to replace EAGLF.

To utilize AUTOLINGUALS, users must provide certain forms of interlanguage that better feed into AUTOLINGUALS. Interlanguage is based on the user's native language. Thus, we may expect this to increase the importance of one's native language education and to lessen the importance of learning English.

Finally, the persistent nature of *linguistic diversity* is confirmed. This reminds us of the policy taken by the European Union. Currency is united under the euro. Language is not; all languages of the member countries are equally their official languages. To say the least, this policy accords with *linguistic diversity* as part of our human nature.

# The creation of polite mitigation in cyber-dialect in light of the theory of Communities of Practice

Kazuko Tanabe

## Abstract

This study targets Computer Mediated Communication defining distinctive language expression using cyber dialects and observes its forming process with reference to the Theory of Communities of Practice. This study mainly analyzes *toiuka* which changes from a functional word into polite mitigation to help smooth communication through grammaticalization. During this process, some variations are derived from the original expression. This paper examines how the usages of these variations characterized the domains on the web and constructed cyber dialect as a kind of social group dialect.

**Keywords:** polite mitigation, cyber-dialect, the theory of Communities of Practice, computer mediated communication.

## 1. Globalization of discourse

Development of information and communication technologies (ICT) has greatly altered human social interactions. In particular, young people enjoy new style of global communication in cyberspace. In this environment, various kinds of mitigation have been created in their conversations. Example include shortened extenders such as *and that* in English (Cheshire, 2007), diminutives such as *-ico(a)*, *-illo(a)* in Spanish (Mendoza, 2007), diminutive such as *-toka* and discourse markers such as *tsuuka* in Japanese (Ootsuji, 1999; Tanabe, 2005). It is explicit that the new global media has expanded its influence beyond the cyber space, exerting enormous influence ordinary resulting in numerous, unique styles of characterized discourse.

This paper attempts to illustrate the grammaticalization of *toiuka* ('rather than') in English and to analyze its variations and changes in computer mediated communication (CMC). *Toiuka* is grammaticalized from a compound phrase particle into mitigation form *tsuuka* via discourse marker (DM): *teka* or *tteka*. While *toiuka* as a compound phrase particle, is located in the middle of utterance, as a DM, it is mostly adopted in the beginning of a sentence. Furthermore, *tsuuka* is located at the beginning position of an utterance when it is adopted as a turn-taking marker (TTM).

Although studies of grammaticalization basically focus on semantic changes, the mitigation of *toiuka* is also accompanied by phonological change. The original form, *toiuka* [toiuka] is transformed into variations of DM, *tteka* [tteka] and *teka* [tekka], etc., and terminates in *tsuuka* [tsu:ka] as TTM. This change shows the tendency for the number of higher vowels to increase as colloquialization progresses.

This present study examines the current situation of Japanese language on the web, characterized by short forms of words, and illustrates the process of globalized language change and the construction of cyber dialect<sup>i</sup>.

## 2. Communities of Practice

This study attempts to explore the construction of the polite mitigation forms *tteka* or *tsuuka* in cyberspace by analyzing the communication in chat rooms and blogs on the Internet with the assumption that Internet domains are communities.

'Communities of Practice' is a concept, which originated from the social theory of learning<sup>ii</sup> (Lave and Wenger, 1991; Wenger 1998), has been examined with regard to its appropriateness as an alternative to other sociolinguistics models such as speech communities and social networks particularly in the area of language and gender. Eckert and McConnell-Ginet (1992, 1995, 1999) attempted to apply this theory to linguistic change and variety in relation to gender research. Eckert (2000) tries to apply this to Belten High school data and other data on adolescent communication.

Davies (2005) argues that the ignorance of hierarchy in ‘Communities of Practice’ and indicates the points which need further thought and development in applying communities of practice to the explanation of language variation. In order to respond to Davies’ proposals and appropriately apply the concept of communities of practice, the present paper will analyze gal’s language especially based upon the three constitutive features of ‘Communities of Practice’: ‘mutual engagement’, ‘joint enterprise’, ‘shared repertoire’. By focusing on these three aspects, ‘communities of practice’ specifically, this study will contribute to verification of the usefulness of applied theory of ‘Communities of Practice’ to explicate the mechanism of construction of cyber dialect<sup>iii</sup>.

### 3. Grammaticalization: *teiuka* from a subordinate marker to mitigation

The change of usage is categorized into four stages depending on the grade, which is determined by the extent to which the usage differs from its original function. Grammaticalization of *teka* has been focus of attention for more than three years although the Sifow’s blog ‘Gal’s revolution’ (<http://blog.livedoor.jp>) is the most effective sample for demonstrating examples of all the stages of *teka* excepting the original *te iuu ka* expression.

Stage 1: Compound phrase particles : *to(te)- iu ka* (rather than)

(Hinds 1982: 301)

(1) *Gakkoo te iu ka puri sukuuru desu ne.*

School rather than preschool copula FP

“Did I say school? I meant preschool.”

Stage 2: Discourse marker/ hearsay marker : *teiukaa* (however)

This is the feedback writing from Sifow to the comment from Konaba.

( Posted by Sifow, February 2<sup>nd</sup>, 2006 )

(<http://blog.livedoor.jp/sifow/archives/13356769.html>)

(2) *Big ni naremasu kasira nee ? ! tteka, naru*

Big P can become wonder FP however become  
*tsumori desu-kedo-tto* ♪(*warai*)  
 am going to be copula-P -P (smile)  
 “I wonder if I could become ‘Big’, however, that is my issue,”  
 (*warai*)  
 (Smile)

Stage 3: Pragmatic marker/ Illocutionary connective: *te-ka* (by the way)  
 ( original blog text February the 2<sup>nd</sup>, 2006)  
 (<http://blog.livedoor.jp/sifow/archives/50377753.html#comments>)

(3) *Sooda! 2gatsu kara enndinngu de nagareru-nn datta!*  
 Ah February from ending P broadcasted I remember  
 “Ah! My song’s gonna be on the ending of that TV program!”  
*Teka moo 2gatsu nanoo!?*  
 By the way already February it is  
 “Well, it’s February already!”

Stage 4: mitigation /(well)

(No record of posting, July 13<sup>th</sup>, 2005)  
 (<http://blog.livedoor.jp/sifow/archives/27884041.html#comments>)

(4) a. *Suimasenn itadenn ni mukatuite dennwa banngoo*  
 Sorry web site P (I) upset telephone number  
*sarashite shimaimashita*  
 open to public be done  
 “I announced the telephone number of the prankster on the web,  
 because I was upset about the prank call.”

( Posted by 暇人(himajinn) July 13<sup>th</sup>, 2005)  
 (<http://blog.livedoor.jp/sifow/archives/27884041.html#comments>)

(4) b. *Tsuuka, dennwa banngo o noseru-tte!*  
 Well telephone number P put it on -P  
*Ikura itazura to omotta-kara-tte.*  
 Even if prank call P think (PAST)- P-P

 number ! Even if you thought it was a prank call.”

*Kakujitsuni itazura-tte wakatte-kara nara*  
surely a prank call-P understand-COJ when  
*mada wakaru-kedo.*  
Possibly (I) would understand-COJ

“If you are sure that was a prank call, I understand why you did it.”

#### 4. Observation of Sample data

Here the method for quantifying the gradualness rate of grammaticalization, using the colloquialization, occurring in domains on the Internet is described. Data was collected using the Yahoo! search engine. Fourteen domains were included: go.jp, ne.jp, co.jp, plaza.rakuten.co.jp, yahoo.co.jp, www.geocities.co.jp, blog.drecom.jp, blog.livedoor.jp, fc2.com, jugem.jp, thebbs.jp, yaplog.jp, milkcafe.net.

**Table 1** shows frequency of use of *toiuka* and its variations: *toyuuka*, *teiukta*, *tteiuka*, *teyuuka*, *tteka*, *teka*, *tekka*, and *tuuka* ( in order of gradualness of grammaticalization) on Internet. The data collected through the Yahoo! search engines verifies the frequency of use of respective words in each domain. It is assumed that the gradualness rate of grammaticalization in each domain can be quantified by the use-frequency of *toiuka* variations during the process of grammaticalization. The ratios of the hit counts for each variation to total number of hits are listed in **Table 1**.

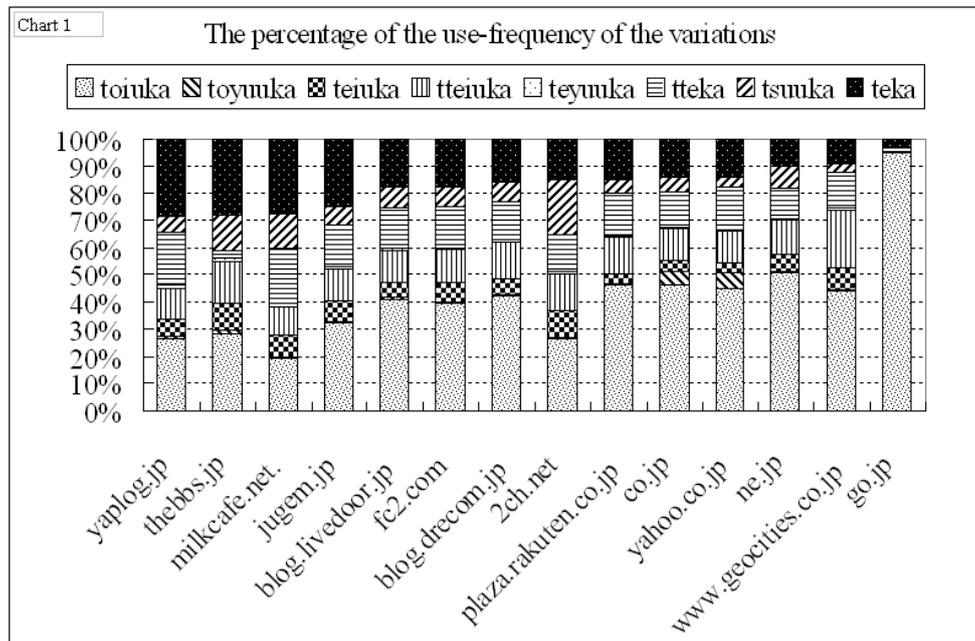

Table 1

domain	toiuka	toyuuka	teiuka	tteiuka	teyuuka	tteka	tsuuka	teka
yaplog.jp	26.48%	0.82%	6.02%	11.66%	1.36%	19.16%	6.03%	28.45%
thebbs.jp	28.25%	1.40%	10.08%	14.87%	1.87%	2.40%	13.31%	27.86%
milkcafe.net	19.47%	0.39%	7.81%	10.34%	1.40%	20.61%	12.57%	27.40%
jugem.jp	32.38%	0.62%	7.53%	11.51%	1.20%	15.51%	6.35%	24.91%
blog.livedoor.jp	41.03%	0.58%	5.53%	11.92%	0.73%	14.89%	7.40%	17.92%
fc2.com	39.65%	0.47%	7.00%	12.12%	0.68%	15.20%	7.10%	17.82%
blog.drecom.jp	42.07%	0.35%	6.43%	13.18%	0.70%	14.41%	7.10%	15.70%
2ch.net	26.32%	0.36%	10.22%	13.25%	1.34%	13.30%	20.29%	14.92%
plaza.rakuten.co.jp	46.14%	0.30%	3.80%	13.79%	0.36%	15.67%	5.01%	14.87%
co.jp	46.23%	5.10%	4.19%	11.29%	0.50%	13.20%	5.10%	14.30%
yahoo.co.jp	44.90%	5.88%	3.75%	11.27%	0.40%	15.94%	3.50%	14.29%
ne.jp	50.69%	0.36%	6.06%	13.04%	0.55%	10.91%	8.00%	10.39%
www.geocities.co.jp	44.18%	0.46%	8.27%	20.43%	1.01%	13.40%	2.98%	9.20%
go.jp	94.97%	0%	0.06%	0.35%	0%	1.49%	0.02%	3.17%

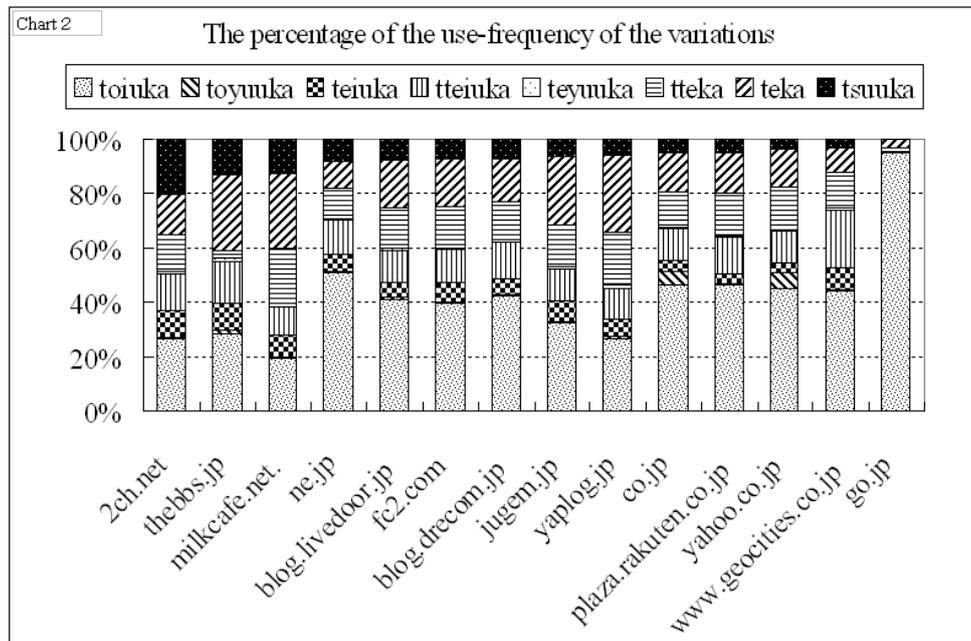

This study focused on the three domains, go.jp, 2ch.net, and milkcafe.net, go.jp is a domain in which government related administrative white papers are released. Accordingly go.jp has a more public function and

consists of higher proportion of text documents and pages. In contrast, 2ch.net and milkcafe.net are popular chat rooms among young people. Their users are expected to communicate as if they were engaging in ordinary face -to- face conversation. Further observation demonstrate that in these two domains *teiuka* which is derived at an initial stage of grammaticalization of *toiuka* is used at roughly the same frequency in these two domains. However, as grammticalization proceeds, variations including long vowels and more pragmticalized functions, i.e. *teyuuka* and *tsuuka* are more often used in 2ch.net. On the other hand, the shortened and double consonant forms, *teka* and *tteka* exceeded the values of frequency of use compared to *toiuka* in milkecafe.net; i.e., that the highly grammaticalized variations are more frequently used than the original *toiuka* form. These observations suggest that, because the domain functions as social group communication between regular users in the domain has colloqualized the ordinary language and created a dialect which characterizes the group.

**Chart 1** shows the percentage in **Table 1** using a bar graph. The results suggest that *teka* and *toiuka* are almost complementary to each other. This is because *toiuka* is mainly adopted in written language and *teka* is frequently used in spoken language. As previously mentioned, go.jp, the domain with the highest percentage of *toiuka* variation, deals with government white papers,while milkcafe.net is a popular blog site among young girls. According to **Chart 1**, milkcafe.net is the most colloqualized of the 14 domains.

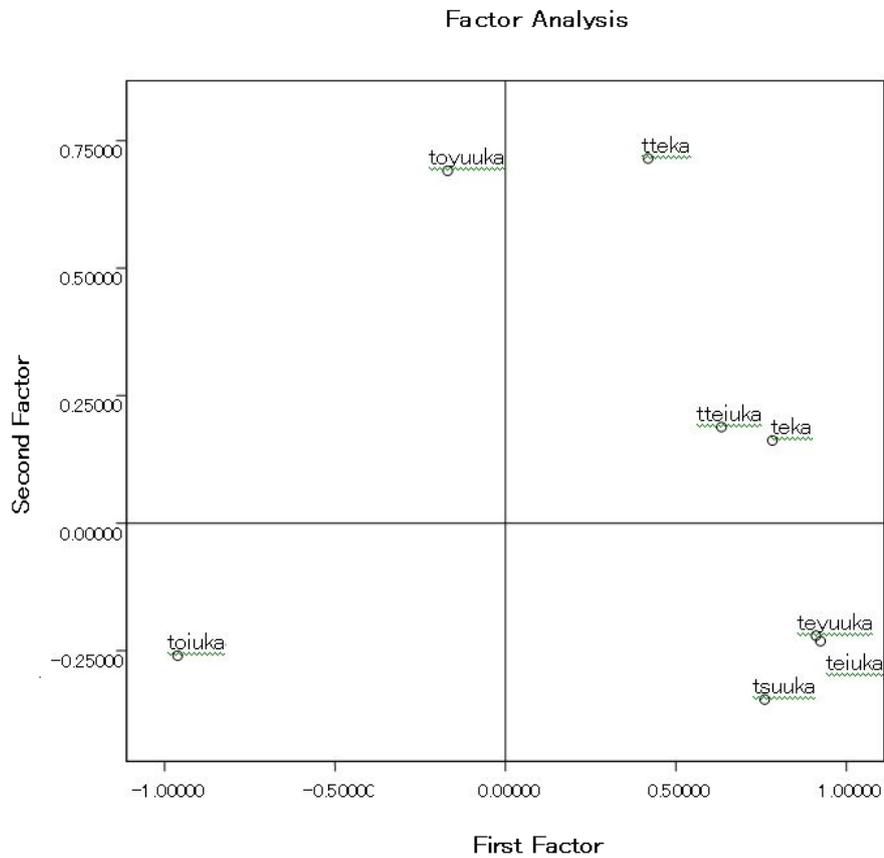

**Chart 2** indicates the descending order of frequency of use of *tsuuka*. The highest percentage domain is 2ch.net and the lowest is go.jp. Along with 2ch.net, the next-highest percentages of *tsuuka* characterization, thebbs.jp and milkcafe.net are highly colloquialized domains as Chart 1 shows. In the contrast, although yaplog.jp and jugem.jp are also more colloquialized, they are located in the middle level of the *tsuuka* use-frequency ratios.

**Figure 1** shows the results of factor analysis of *toiuka* variations. The third quadrant comprises *toiuka* use alone. The first quadrant diagonally across, *teka*, *tteka*, and *tteiuka*, can be used as a measurement standard for degree of colloquialization. The third and fourth quadrants are divided into two areas by the axis: *toiuka* and *toyuuka* on the left side and *tsuuka*, *teyuuka*, and *teiuuka* on the right side. These two areas considered separate groups; i.e., the original *toiuka* form and its *tteka* and *tsuuka* variations.

**Figure 1**

	components	
	1	2
toiuka	-0.96138	-0.2599
teiuka	0.924174	-0.23149
teyuuka	0.91101	-0.22058
teka	0.783189	0.161739
tsuuka	0.760551	-0.34576
tteiuka	0.633807	0.188309
tteka	0.418304	0.714515
toyuuka	-0.16928	0.690644

**Figure 2** shows the results of the factor analysis conducted for each domain. Milkcafe.net, go.jp and jugem.jp are divided into three areas, forming a triangle. This phenomenon is caused by two important factors. First, in the domain, go.jp, *toiuka* accounts for 94.97% while milkcafe.net accounts for

19.47% which is an extremely low value. This enormous difference between two values is remarkable. Secondly, in the jugem.jp, teka, which is a measure degree of colloquialization shows relatively higher value 24.91% than huge domains such as yahoo.co.jp, co.jp while its original *toiuka* form also shows higher value 32.38%. In contrast, value of *tsuuka* which is another measure degree of colloquialization is lower than milkcafe.net.

## 5. Application of Communities of Practice

In this section, the concept of Communities of Practice is examined to determine its usefulness as an alternative sociolinguistic model for speech communities and social network. As indicated by Davis (2005), the term ‘joint enterprise’ is rarely used except in certain commercial or business situations. Since ‘Communities of Practice’ was originally a learning theory, it cannot interpret the linguistics phenomena perfectly. However, this theory is significant because it assumes that the concept of ‘communities’ dose not always regard authorities or hierarchies as essential factors, which is particularly relevant to the unregulated nature of cyberspace.

As evidences of ‘mutual engagement’ and ‘shared repertories’, in the blog of “ the Gal’s revolution”, the variation of *teka* and *tteka* have been adopted by supporters and fans of the blog author, Shifow. These two variations have appeared since the blog started. This tendency has been continuing during the four-year history of the blog. If supportive commenters read past blog entries, they will undoubtedly notice that these two expressions are among those most used by Shifow. As a result of this, not only colloquialized form but also the grammaticalized usage of *teka* and

*tteka* has been transformed by both Shifow and her readers.

## **6. Conclusion**

The present paper has examined the applicability of the Communities of Practice theory in analyzing the construction of cyber dialects. The sample blogs and chat rooms examined here were organized by Japanese young users. The frequent interaction on these sites constructs a characteristic speech style depending on the group. Thus, members who feel attached to these cyber communities create an identity as regular visitors. When communicating with other members, these users recognize and learn the authentic speech style created inside the group and consequently strengthen and develop their own speech variation through frequent use of the group style.

The language behavior described above is consistent with the Communities of Practice processes of ‘mutual engagement’, ‘joint enterprise’ and ‘shared repertoire’. In this study, ‘mutual engagement’ was the interaction in cyberspace. Users engage in mutual support and construct human relationships through communication within their favorite cyber community. Many members feel privileged to be included and consider these community relationships to be a form of friendship.

‘Joint enterprise’ was indicated by participation in the movement of changing language. Users enjoy using unorthodox language, which is only adopted inside the domain and is employed to recognized membership. This experience consolidates their identity within their particular cyber community.

Finally, ‘shared repertoire’, the final stage of ‘Communities of Practice’, is identified in the present study as the common use of the authentic group language in the cyber community. Thus, although some modifications are necessary, ‘Communities of Practice’ is significant in developing a theory of analyzing socio-group dialects and can contribute to developing a more elaborate theory.

### Abbreviations

COJ	conjunctive particle	COP	copula
FP	final particle	PAST	past tense
P	particle		

---

<sup>i</sup> Sorede(motte) is another example of cyber dialect. It is grammaticalized from conjunction into mitigation, nnde(motte) via sonnde(motte).

<sup>ii</sup> A communities of practice is an aggregate of people who come together around some enterprise.

United by this common enterprise, people come to develop and share ways of doing things, ways of talking, beliefs, values - in short, practice – as a function of their joint engagement in activity (Eckert 2004: 35).

<sup>iii</sup> Within this framework (a spatially aware and theorized framework of CMC activities), questions of who are given individual is in ‘real life’, man or woman, young or old, become less relevant than the exploration of who, with what kinds of resources, and why, ‘they do being’ in terms of sense of self and modes of sociality in the CMC spaces (Georgakopoulou 2006 : 552).

# **Reinterpreting intercultural moments: A case of peer discussions among foreign graduate students in Japan**

**Keiko Ikeda**

Nagoya University  
Furo, Chikusa, Nagoya  
Graduate School of Languages and Cultures  
ikeda@lang.nagoya-u.ac.jp

## **Abstract**

When are the “relevant moments” for interculturality? Why do participants invoke, accept, and collaboratively develop them? When do they resist them? This study explores these questions by examining the case of foreign graduate students in Japan. It examines a series of group discussions held for a graduate seminar course in a Japanese university. This study examines the discourse data drawing on conversation analysis. The analysis of the discourse data shows that while moments of interculturality repeatedly appeared in their talk, these moments were invoked in order for the speakers to pursue trans-cultural social purposes. Put another way, while non-Japanese students invoked their foreign-ness in their talk, they did so *en passant*, not as an ultimate goal.

**Keywords:** interculturality, conversation analysis, category bound activity, narrative, situated identity.

## **1. Introduction**

In the past ten years, discursive-constructionists have explored the notion of interculturality and have shown that moments of interculturality are ephemeral. Interculturality is not an omni-relevant condition of interaction, but is instead something participants negotiate. Even in what seem self-evidently “cross-cultural” contexts, such as conversation exchange tables between Japanese and American students (Mori 2003), a discussion between a Japanese radio host and a foreign student guest (Nishizaka, 1999), or the study-abroad experiences of Korean students in Japan (E.Zimmerman, 2007), detailed conversation analysis of the actual interactions amongst participants shows that the mere fact that the speakers are from different cultural groups does not automatically result in interactionally-relevant self-identifications as culturally “different.”

In other words, moments of interculturality are not present *a priori*; rather, they emerge only when participants decide to treat them as relevant. What makes the interaction relevantly intercultural is neither something outside the interaction or what each participant thinks about each other, rather, it is a form of exchange in the interaction itself.

## **2. The Study**

### *2.1. Research Questions*

In this study, I will first start by detecting the moments of construction of interculturality. The moments of interculturality is understood as the moments when speakers accept intercultural selves, for example, presenting (projecting) self as Japanese, Korean, or Thai, or at a more abstract category, someone from other cultures, in interaction among selves. My stance here is to argue that the fact of being intercultural is itself a social phenomenon (Nishizaka, 1995: 302), and the fact of being culturally different is indeed an achievement in and through talk-in-interaction. The literature before me have already made this point based on various data source (e.g., Nishizaka, 1995; Mori, 2003; E. Zimmerman, 2007).

The ultimate research question in this study is to ask “When do they let others or project from themselves such moments in a particular social context? When are the “moments” for interculturality? How, and why do participants invoke, accept, and collaboratively develop them?” And these questions invoke some further questions to follow.

When we identify the moments in the talk-in-interaction, the next question is to ask how these moments get constructed. Who starts it, and whom is it addressed? How does the addressee treat the projection of intercultural self in their talk? How do the participants present develop the intercultural selves?

Although this is an integral part of my aim in this study, I would like to probe even further, in other words, which is the main research question of my paper. That is, what are these moments for? When in talk, and how are intercultural moments made irrelevant? Why do we go about doing these works?

There are further issues to consider in addition. Participants do not always welcome the moments of interculturality to prolong in their interaction. At times, participants resist, or treat interculturality irrelevant, particularly when such intercultural

selves are proposed to them by someone other than themselves. What are the reasons in the developing talk that they resist (or curtail) the moments of interculturality? When they do so, *how* do they accomplish resisting it through their interaction? And ultimately, what is the social consequence (accomplishment) which such irrelevancy brings to the participants? With these questions in mind, this study will tackle a piece of naturally occurring discourse data in Japanese.

## 2.2. *The Method of Analysis*

I will be adopting a similar set of methodologies to analyze the data for this study as the other presenters in the organized topic, i.e., drawing on Membership Categorization Device (Sacks, 1972, Schegloff, 2007), Category-bound Activities (Jayyusi, 1986) in this paper. Membership categorization device or MCD is composed of two parts, 1<sup>st</sup>, one or more collections of categories, and 2<sup>nd</sup>, some rules of application. I do not have time to explore this entire apparatus today, however, I will point out some most relevant concepts within it for this study, namely, concept of partitioning constancy and inconstancy. I will also draw on conversation analytic approach to storytelling in particular, because the data I collected generated many occasions of personal storytelling.

### 2.2.1 *Partitioning Constancy and Inconstancy*

Within the conceptualization of Membership Categorization, Sacks' lecture has discussed a particular notion which directly indexes what I am after. They are partitioning constancy and inconstancy (Sacks, 1972; Schegloff, 2007: 468). *Partitioning constancy* registers the observation that on a given occasion, with its particular composition of participants, some two membership categorization devices (MCDs) could turn out to partition those participants identically, i.e., the individuals may end up "differently being members of the same categories under the application of alternative category collections." (Schegloff, 2007:468). On the other hand, some two MCDs may have *partition inconstancy*, which means that each partitioning the local population differently than the other does, yielding alternative co-class memberships.

Sacks (1992) provides a specific example: A group therapy session – someone behind the mirror (one-way mirror), categorizable as ['patients' and 'observer,'] but by saying "we are about to start" "Testing" leaning forward to the microphone then they thereby invoke an alternative categorization device- ["performer" and "audience."]

(Sacks, 1972[1992: vol 1:590-594], cited in Schegloff, 2007) These categories parallel each other, i.e., partitioning constancy. All the persons who are patients, then now are performers under the other category collection. However, the two sets refract the scene rather differently (Schegloff, 2007: 468).

With the same example, we also see the bearing of partitioning inconstancy. By reference to [patients and observer] category, these two are different categories within its collection. The same can be said about the alternative category, [performer and audience.] Both partitioning constancy and inconstancy can serve as vehicles for replacing the relevance of one set of category terms by another. And they can thereby “cover or camouflage” identities, activating alternative bodies of common sense knowledge, inference, perception, etc. to conduct and understand in the situation and of the situation (Schegloff, 2007:469). What Schegloff states here is highly relevant for this study because my focus is to see how intercultural moments (which can be considered as two apparently different memberships as [culture A] versus [culture B]) transforms into something else, we can imagine these both cases above are plausible routes which we can witness in the data.

### *2.2.2. Category-bound activities:*

In this paper I also draw on category-bound activities to examine what the speakers are doing in terms of constructing a category. One can allude to a category membership by mentioning an action that is category-bound. The doing of a category-bound action can introduce into a scene or an occasion the relevance of the category to which that action is bound (Schegloff, 2007:470).

One can allude to the category membership of a person by mentioning that person's doing of a particular action, and the doing of a category-bound action can introduce the relevance of category into the scene (470).

### *2.2.3. Narrative Analysis*

The most relevant aspect of storytelling from CA perspective for this study can be summarized as the following (Schegloff, 1997: 103):

- 1) What stories are about, given their recipients and various occasions in which they are told, may be related to the trajectory of telling itself (Schegloff, 1997: 102, Jefferson, 1988).

2) We cannot know what distinctive features of structure or interactional enactment a story will generate in advance (e.g., Labov & Waletzky, 1967). The uptake in the course of telling by the recipients of the story becomes highly crucial for it.

3) Story telling embedded in our everyday communication is often used to “do something” rather than just being told “for their own sake.”

As we will see in this study, the intercultural moments get invoked and resisted encompassing the development of a narrative. The story undertaken by the teller may provide a moment of interculturality, yet the uptakes of the story by the recipients may work against it and transform the interpretation of the narrative to some other matters besides it.

### 2.3. *The Data*

The participants of the talk to be examined in this study are graduate students in Japan. It examines a series of group discussions held for a graduate seminar course in a Japanese university. The regular attendees for the discussions were four native Japanese and six to eight foreign graduate students from other countries (Thailand, Sri Lanka, Taiwan, the People’s Republic of China, and Indonesia). As you can see in the slide, they gathered in a classroom in the university after a graduate class, then talked for approximately 30 minutes with no supervision. The discussion routine was a part of their seminar activity.

They engaged in a round-table discussion every few months and casually discussed various topics related to, but not at all exclusively limited to, their own learning processes as graduate students. Their common language for communication was Japanese. ((Despite more than a few Chinese native speakers present, there was no code-switching to Chinese even during the discussion time.))

The discussions were video- and audio-recorded, and transcribed according to the system commonly adopted in studies that take a conversation analytic approach to discourse (Jefferson, 1984; Schegloff, 2007).

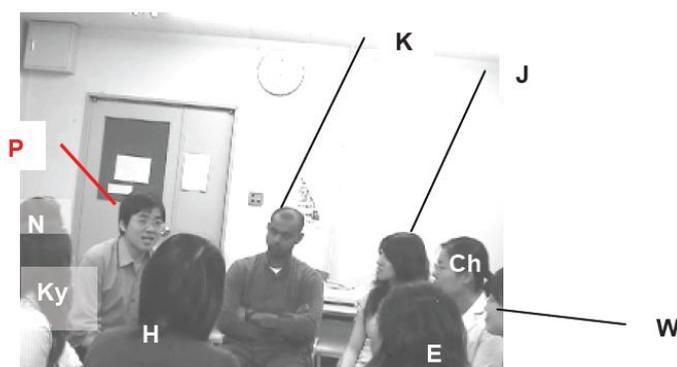

In this study, I will focus on the moments in the data in which these participants invoke intercultural moments, and through such a process they resulted in establishing a *common*, or what I call in this paper *transcultural* identity with their Japanese and non-Japanese peers. The goal of this presentation is to illustrate that in the data examined

here, the moment of interculturality—emergence of “cultural others”—is actually transformed into an opportunity to construct transcultural identity among the participants, which ultimately contribute to re-establish their graduate student-hood with different levels of experience. Along the way, I would like to provide answers to the above mentioned questions on interculturality.

### 3. The Analysis

In this paper, I will discuss one particular example from the data collection. The excerpt contains a personal narrative by so-called foreign graduate students from Thailand. There are 9 participants, P, E, K, Ch, H, Ka, Ky, W, and N. The main focus of this paper is P, a student from Thailand, K, a Japanese student, and H, a student from Indonesia.

Figure 1. Participants of the Group Discussion

#### 3.1. Speaker P's Narrative

Let us first discuss what P has said in the personal narrative. His narrative is composed of two major chronological parts, namely, when he was in Thailand, and then when he first started his graduate program in Japan. He constructs his narrative in a before-after framework, the life in Thai being the before and the one in Japan the after. The appendix A indicates the segment studied here entirely.

Excerpt 1 illustrates the beginning of P's telling.

#### Excerpt 1.

- 1 P: eto watashi ichiban taihen datta no wa desu ne: benkyoo shite
- 2 ita (.) toki no, [supiido to,

activities, invoking [teacher-student ] standard relationship pair to describe both his life styles in Thai and Japan. In the telling about the Thai student life, he says in line 15 *kochira no hoo kara sekkyokuteki ni morao to shinai* “I did not try to obtain anything from my side” and in line 16-17 describing the teacher’s action as *kande kande ataetekureta* “chew and chew, then give (the information) to us.”

Excerpt 3 indicates P’s telling of his student life in Japan. The Thai telling has already established the standard pair and the most category-bound activity, thus the second part was easily understood in the same vein. At the same time, these are also heard as appropriate, category-bound thoughts for particular kind of students, that is, someone with linguistic difficulty (Foreign students).

### Excerpt 3

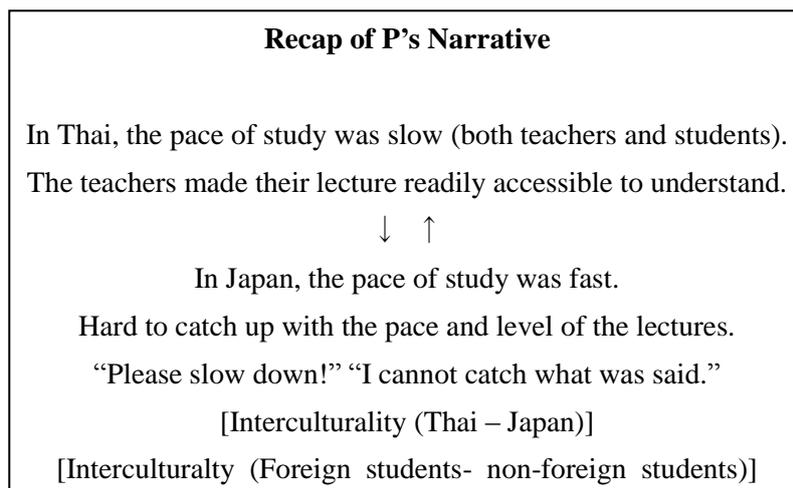

- 22→ P: daigakuin no kenkyuusee no toki wa desu ne: nanka tooji wa (.)  
*"when I was still a research student, at that time,"*
- 23→ nanka kenkyuusee sensee no jugyoo o ukeru koto ga dekiru  
*"well, they were able to audit the professors' lectures."*
- 24→ IMA dame na n desu kedo tooji wa dekite  
*"until now, though, at that time we could."*
- 25 Ka: ((coughs))
- 26→ P: de O-sensei wa irassharanakatta n desu kedo honto ni (.)  
*"so Prof. O was still here and she was really (.)"*
- 27→ nanka shokku tte yuu ka .hh ((looking at Woo))  
*"I was kind of shocked."*
- 28→ Bunpoo wa konna ni kuwashii n da! toka. Honto ni tabun S
- 29→ sensei toka mo honto ni zenzen kikitorenakute /((Ch: nods back))  
*"(Japanese) structure is in this detail! I thought. Really Prof. S too, I was not able to catch what she says at all."*
- 30→ A moo chotto yukkuri shite yo! De honto ni tsuite ikenakatta
- 31→ toki ga atte. (1) hmm. Tte yuu ka.  
*"(I wanted to say) please slow down a bit! So there's time when I could not catch up. (1) hmm I mean."*

On the contrary to what we saw in Excerpt 2, in his telling about Japanese student life he projects it through verbalizing his inner thoughts in self-quotations, as in line 28 *bunpoo wa konna ni kuwashii n da!* “Japanese structure is in this detail!?” and in line 30

*A moo chotto yukkuri shite yo!* “please slow down a bit!” (to Professor S).

Given the telling here, one can examine the contrastive presentation of Thai life versus Japan life, which projects the speaker (P) to have an intercultural self vis-à-vis others present. Figure 3 below illustrates a recap of P’s narrative as discussed thus far.

Figure 3 Recap of P’s narrative

However, this is not quite the way how the participants actually treated the telling. Let us further look at the uptake by his recipients in the next section.

### 3.2. The recipient reactions of P’s personal narrative

Excerpt 4 is immediately after the completion of P’s narrative.

#### Excerpt 4

- 32 H: ((looks at E. E nods deeply and everyone notices her emphatic nods))
- 33 ALL: laughs
- 34→ E: *issho! Watashi ima soo! Ima demo (\*)*  
*“the same! I am that now. Still now. (\*)”*
- 35 ALL: giggles

Focusing on how the recipients of P’s narrative get involved in making sense of the telling. ((narrative and listeners’ interpretation literature)), we notice first that in 32, H turns to E who is sitting next to herself, and eventually all those present gazed at E (see

Figure 4). Then in line 34, E shouts out with emotion “the same!” indicating that she is finding difficult to catch everything the professors say in the classes.

Figure 4 E’s reaction “the same! I am that now. Still now.(\*)”

What does E mean here by saying “the same”? Has she invoked the category-bound activity to index the membership category for foreign students? Not being able to catch (comprehend) everything in the lecture can be treated as a category-bound activity for foreign students. E is a student from Indonesia, just arrived to this country, and struggling to survive in a Japanese graduate program.

Let us see P’s follow-up response to this E’s reaction in Excerpt 5.

#### Excerpt 5

36→ P: hehe iya demo tatoeba Ssensei S sensei no hoo da to

37→ >tatoeba< oshie(.)tai no ga ippai ippai de

*“hehe no but for example to Prof.S, for example,  
She wants to teach (you) so much, so”*

38 E: nods

39→ P: nanka to omotta kaRA ma (.) ((looks at others)) sorenari ni

*“so she thinks, uh accordingly”*

40→ Supiido mo agatte kuru to omoimasu kedo (.) yappari

41→ nagaku iru to (.)

*“speed will improve eventually (.) as one stays longer (.)”*

42→ nantonaku narete kite: (.) ma hayai no mo ma: betsu ni zenbu

*“somehow one gets used to it (.) uh even if it’s fast, if not”*

wakaranaku TEMO pointo o (.) wakaru dake de

*“understand completely, all one needs is to get the points.”*

((H nods while P speaks, towards J, Ch, and W))

43 Ch: ah:: ((sits back))

**"oh::"**

44 W: nods at P

Upon E's comment in line 34, P responds "speed will improve eventually (.) as one stays longer (.)" in line 41, suggesting her listening skills will improve, as she spends more time in Japan. Here we see that [foreign student] category membership was invoked collaboratively.

How this shouting by E gets interpreted must be examined even further in the development of the talk. The rest of the participants giggles and send smiles at E, and P gazes at E saying from line 37 a couple of comments. First he comments that Prof. S wants to teach students so much ( thus she speaks fast, thus it is hard to catch up), and then in 40-41 P says that that one gets used to the speech as one stays (in Japan) longer. P's statements here accept E's projection of newly emerged category membership of [foreign students]. The old intercultural category, Thai vs. Japan has now been faded in the background upon this new category.

### *3.3. Transformation to Transcultural Category*

In addition to the newly developed membership category [foreign students], the further interaction in the group shows there was yet another development of a new membership category. Let us examine Excerpt 5 once more, this time with a careful transcription of the participants' kinetic performance along with their utterances. In line 41-42, P further comments that "even if you cannot get everything, all one needs to get is the main points." Who was this statement addressed to? As P states this, his gaze shifted and drifted off from E, and moved around to J, Ch, and W, then back to E as shown in Figure 5.

Figure 5 Line 41-42. P's eye gaze movements

With this statement, we can also observe something else. In addition, as in Figure 5 while P is making that statement, H, a Japanese doctorate student, also nods and looks at the students whom P has just made an eye contact with. What we see here is a collaborative team work between P and H, and P is representing the message. What was H's entitlement to display her co-authoring of P's statement here? P and H are only two doctorate students in this particular group, and the rest are first year Master's students. Here, we now observe an emerging category in replacement of potential intercultural category-- that is, expert-novice graduate student hood, and the foreign student hood and Thai vs. Japan are all faded out.

Let us recap here what had happened in these few lines in Figure 6.

Figure 6 Recap of recipients' response to P

<p><b>Recap of Recipients' response to P's personal narrative</b></p> <p>P1- "In Japan [compared with how it was in Thai], I was not able to catch up with the professors' speed of lecture first"</p> <p>E- "I am in the same situation"</p> <p>→ Potentially emerging category: intercultural selves ((P &amp; E)) as Cultural Others [Interculturality (Foreign students- non-foreign students)]</p> <p>P2- "All one needs to do is to get the main points of the lecture"</p> <p>H- "nods and displays her co-authoring with P2"</p> <p>→ Newly foregrounded category : ((P &amp; H)) as Senior Students against Novices [ Graduate Student-hood : Senior (expert)—Junior (novice)]</p>
---

In this telling, the speaker starts with a comparison of university environment in

Thailand and Japan, which at least provoked his intercultural self that he is cultural other to the present context. However, when we closely examine how he formulates the telling and the inference-work done by the participants in the talk, we learn that the [Thai-Japan] intercultural moment gets very quickly faded out, and a new category was invoked. The foreign student category was projected by a recipient of the telling, but in the following sequence, the responding recipients also dismissed this category and transformed it to an alternative category, graduate student-hood which all the participants are now treated as members. They elevated the reason for the telling through multiple occasions of partitioning constancy (Sacks, 1992), that is, they end up being members of the same, transcultural category under the application of alternative category collections.”(Schegloff, 2007:468).

#### **4. Conclusion**

This study showed how the speakers in this particular context, although they bring in their intercultural selves (D. Zimmerman, 1998) momentarily, or at least invokes potential moments for interculturality in passing, they quickly treat these moments as irrelevant for the on-going talk. The study showed that the participants immediately invoked a new category through mentioning and accepting the category bound activities for the new collection. In the current example, senior-junior graduate student-hood categories (identities) took place over the intercultural self-categorization. We can say that the tellings were ultimately treated both by tellers and listeners to construct a ‘transcultural’ membership category, which they all can be part of in different ways. The participants in the group discussions managed these intercultural potentials and transformed them into the opportunities to re-build who they are vis-à-vis each other, as graduate students in the university. This is not surprising, since the initial purpose of this activity is to have gatherings as such. They are conversation-for-learning graduate student-hood, and such a purpose was understood and worked out in their talk.

To provide an answer to my research questions, namely “When in talk, and how are intercultural moments made irrelevant? And why?” This study can suggest the following: The intercultural moments are made irrelevant in order to achieve some other social purpose for the occasioned talk. The examples I looked at in this study show that they are gathering in order to rebuild and confirm their social relationships within the same membership category, that is, graduate student hood—and their interculturality does not index much significance to this particular co-construction of social identity. By

following through from the emergence of a personal telling until it is received by the listeners of it, and drawing on microanalytic approach to capture the participants' actions, this study described the process by which interculturality gets backgrounded and transculturality comes foregrounded.

# **Internationalismen in globalen Diskursen am Beispiel des Deutschen und Japanischen**

**Werner, Angelika**

Dokkyo University, Tokyo, Faculty of Foreign Languages, Prof.  
340-0042 Soka, Gakuen-cho 1-1, Japan  
angelika@dokkyo.ac.jp

## **Abstract**

In German as well as in Japanese a many new words appearing in the languages are borrowed from English, more precisely they are Anglo-American words. This paper will argue that the phenomenon of borrowing Anglo-American words has a lot of advantages for a smoother understanding in worldwide communication. A lot of these words are common in the European languages, some are originally Latin (e.g. *Student, Museum, Exil*) and they can assimilate easily into the most Indo-European languages in both, their form (congruent pronunciation and/or writing), and (almost adequate) meaning. A smooth basic intercultural communication will also provide good support in the field of foreign language acquisition, because the learner already knows a part of the vocabulary of the target language.

**Keywords:** Global Discourse, Internationalisms, German, Japanese

## **0. Einführung ins Thema**

Sowohl im Deutschen als auch im Japanischen tauchen in den letzten Jahren eine Menge neuer Wörter auf, die aus dem Englischen, genauer gesagt Anglo-Amerikanischen, kommen.

Gerade in letzter Zeit ist in Deutschland wieder einmal eine Diskussion über den Einfluss der amerikanischen Fremdwörter in Gang: ich erinnere nur an den unsäglich schlechten Artikel im SPIEGEL (2.10.2006), den nicht zu bremsenden großen Erfolg der Verbreitung einer deutschen Sprachnorm von „Zwiebelfisch“ Bastian Sick, oder etwa den „Anglizismen-Index“ des „Vereins für Deutsche Sprache e.V.“ oder auch den Artikel über die „Bundestagsdebatte zur Situation der deutschen Sprache“ mit dem Foto von Nida-Rümelin (Verein Deutsche Sprache e.V. 2002).

Hier ist ein Feld, wo jeder Sprachteilnehmer oder Möchtegern-Sprachwissenschaftler sich zu äußern berechtigt fühlt, und man sich unendlich und trefflich streiten kann.

Deshalb möchte ich hier einmal auf die lange Tradition und die positiven Seiten von Fremdwörtern und Internationalismen in globalen Diskursen hinweisen. In diesem Aufsatz möchte ich dafür plädieren, dass die Übernahme dieser Wörter in die eigene Sprache eine Menge Vorteile für ein besseres Verstehen in der internationalen Kommunikation hat.

Ich möchte zeigen, dass die Integration von Wörtern aus anderen Sprachen, besonders dem global gebrauchten Anglo-Amerikanischen, der selbst aus einer bunten Mischung verschiedener Sprachen, basierend auf dem europäischen lateinisch-griechischen Wortschatz, besteht, nicht zu Oberflächlichkeit und Verlust der eigenen Sprache führt, sondern große Chancen für die Verständigung in einem globalen Rahmen hat. Dies trifft besonders zu für die Bereiche Business und Technik, aber auch für Spezialgebiete wie Architektur, Mode, Design, Musik.

Im Bewusstsein die gleichen Vokabeln wie die Interaktionspartner zu benutzen

muss man sich nur noch auf die je nach Ausgangssprache der Sprecher unterschiedliche Aussprache einstellen um sich auf internationaler Ebene zu verständigen. Diesen Aspekt möchte ich auch besonders für den FS-Erwerb als wichtig ansehen, denn der Lerner kennt bereits einen Teil des Wortschatzes der Zielsprache. Das möchte ich am Deutschen und Japanischen genauer erläutern.

Da es hier um Diskurse geht, möchte ich zunächst einmal vorstellen, was ich darunter verstehe: Ich möchte mich vor allem beschäftigen mit dem „sprachkritischen Diskurs, der Fragen der rhetorisch-stilistischen Gestaltung von Sprache durch Fremdwörter diskutiert und ein Ideal bzw. eine Ethik der Kommunikation im Zusammenhang mit der Fremdwortverwendung impliziert“ (nach Gardt 2001: 134).<sup>1</sup>

Mir geht es um den Diskurs in der sprachinteressierten Öffentlichkeit, den man in Zeitungen, Zeitschriften, Fernsehen usw. aufgezeichnet findet. Es geht mir explizit nicht um Jugendsprache, E-Mails, den „Stammtisch“, sondern um die Verwendung von international gebräuchlichen Wörtern in Publikationsorganen. Dies sei auch abgegrenzt von wissenschaftlichen Publikationen, besonders linguistischen, da wie Spitzmüller in seinem Buch über die Metadiskurse in Einstellungen zu Anglizismen 2005 feststellt, diese beiden inkompatibel seien. Die Wissenschaft ist idealerweise beschreibend und Neuerungen gegenüber eher offen, die Verwendung bei den Sprechern aber setzt ein kommunikatives Bedürfnis voraus. Bei den anvisierten Diskursen der Öffentlichkeit, die ein relativ starres Sprachsystem hat, spielen die Einstellungen (attitudes) gegenüber der Sprache und deren Elementen und die Identität der (Teil-)Sprachgemeinschaft eine große Rolle „als kollektives „Sozialsymbol“ und zur Identitäts- und Unterscheidungskonstitution<sup>2</sup> in der konkreten erlebten gesellschaftlichen Situation dient“ (Spitzmüller 2005: 363). Für die Sprecher ist die Einstellung gegenüber der Sprache und ihrer Verwendung eine emotionale Angelegenheit, die die Identität der Sprecher wesentlich mitbestimmt.

Die Festlegung etwa, ob es sich bei einem Wort um ein Fremdwort handelt oder nicht hängt im Wesentlichen von der Einstellung der Sprecher (individuell oder kollektiv) ab. Dies lässt sich durch empirische Untersuchungen und Befragungen immer wieder belegen (Werner 2003: 16ff; Hofmann 2002: 246; s. auch Gardt 2001: 32; s. auch dudens-online 318). Der entscheidende Unterschied im Umgang mit Sprache ist also die Nähe des Gebrauchs der Sprecher zu „ihrer“ Sprache gegenüber der per definitionem gegebenen Distanz der Wissenschaft zu einer Sprache.

## **1. Deutsch und Lehndeutsch**

Das Deutsche hat eine lange Geschichte, Wörter aus anderen Sprachen zu integrieren. Als Ergebnis ist das Deutsche heute eine Sprache mit einem reichen Wortschatz und der Möglichkeit sich in feinen Nuancen auszudrücken. Die fremden Wörter können recht leicht assimiliert werden, indem sie eine deutsche Schreibung (zumindest haben die Nomen Majuskeln am Anfang) oder Prosodie erhalten. Es haben sich sogar im Laufe der Zeit eigene Sprachregeln gebildet, z.B. Flexionsendungen wie

---

<sup>1</sup> Ich stimme zwar Cameron (1995) zu, dass alle Diskurse auch ideologisch sind, möchte dies hier aber nicht behandeln.

<sup>2</sup> In diese Kategorie gehören auch auch die umfangreichen Komplexe wie Nationalsprache, oder diastratisch-diatopische Unterscheidungsmerkmale.

für die Konjugation von Verben (-ieren)<sup>3</sup>, für Nomen Artikel und Pluralendungen (-s), oder Derivationsmorpheme bei Adjektiven wie -ior oder -abel/ -ibel.

Allerdings leidet das heutige Deutsch keineswegs an einer Überfrachtung mit Fremdwörtern oder Anglizismen, wenn man mit der Vergangenheit vergleicht und die Wörter in Relation zum Gesamtwortschatz setzt.

Der mit rund 2800 Wörtern aufgestellte deutsche Grundwortschatz enthält etwa 6% fremde Wörter. Der Anteil beispielsweise von englischen Fremdwörtern an der Gesamtheit aller verwendeten Wörter lag selbst bei Untersuchung fremdwortintensiver, nämlich werbesprachlicher Textsorten lediglich bei 4%.

Bei einer Auszählung der Fremdwörter in einer Tageszeitung aus dem Jahre 1860 kam man zu einem Ergebnis, das nur wenig unter den heute ermittelten Durchschnittswerten lag. Der Grund dafür liegt u. a. in der relativ schnellen Vergänglichkeit vieler Fremdwörter: Es kommen nämlich fast ebenso viele Fremdwörter aus dem Gebrauch wie neue in Gebrauch. Die alten Fremdwörterbücher machen bei einem Vergleich mit dem gegenwärtigen Fremdwortgut das Kommen und Gehen der Wörter oder ihren Bedeutungswandel genauso deutlich wie die Lektüre unserer Klassiker.

(duden online S. 319)

Es ist allerdings nicht so ganz einfach zu definieren, was ein Fremdwort ist. Der Terminus ist erst seit dem 19. Jahrhundert belegt.<sup>4</sup>

Die Unterscheidung in *Fremdwort* und *Lehnwort* erscheint mir auch weder im Deutschen noch in anderen Sprachen sinnvoll<sup>5</sup> und ich möchte deshalb nur die Bezeichnung „Fremdwort“ verwenden.

Die gängige Unterscheidung zwischen „Fremdwort“ und „Lehnwort“ ist auch empirisch nicht operabel, Polenz (1999) spricht von „Lehndeutsch“. Die Definition wird von den Sprechern (Mikroebene) oder der Sprachgemeinschaft (Makroebene) in der Praxis vorgenommen, durch: Akzeptanz der Ausdrucksseite (Kongruenz) und/oder der Inhaltsseite (Äquivalenz), sowie Verwendung und Verbreitung, was dazu führt, dass Sprachwandel stattfindet und Entlehnungen funktional operieren. Fremdwörter haben oft versachlichende Funktion und ermöglichen dadurch taktvolles Sprechen über heikle, unangenehme oder tabuisierte Themen und ermöglichen eine präzisere Formulierung.

---

<sup>3</sup> Die „Rückläufige Wortliste des heutigen Deutsch“ (Brückner/Sauter 1984) enthält mehr als 2.800 Bildungen auf -ieren / -isieren.

<sup>4</sup> „Das Wort *Fremdwort* wurde vermutlich von dem Philosophen und Puristen K.C.F. Krause (1781–1832) geprägt und durch Jean Paul im »Hesperus« (1819) verbreitet; zuvor finden sich meist zusammengesetzte Ausdrücke wie *ausheimisches/ ausländisches/fremdes Wort*. Die kritische Reflexion über den Fremdwortgebrauch ist allerdings mindestens vierhundert Jahre alter als das Wort selbst. Sie findet sich bereits im 15. Jh., in gemäßigter Form z.B. bei dem Humanisten Niclas von Wyle (1478).“ aus : duden online S. 524.

<sup>5</sup> S. genauer hierzu Werner (2003, 14 ff).

## 2. Europäismen und Internationalismen

Eine große Zahl der Wörter haben die europäischen Sprachen gemeinsam, die meisten sind griechischen oder lateinischen Ursprungs (*Student, Exil, Aquarium, Museum*) und können sich deshalb gut in die meisten europäischen Sprachen einfügen, sowohl in der Form (Kongruenz) als auch in der Bedeutung (Äquivalenz). Man kann hierbei von „Europäismen“ oder „Internationalismen“ sprechen. Diese sind nach Schaefer (1990: 39f.) wie folgt definiert:

Die einen Internationalismus repräsentierenden Wörter haben:

- die gleiche oder ähnliche Bedeutung (Äquivalenz) und zusätzlich die gleiche oder eine ähnliche Form (Kongruenz),
- sind ohne Übersetzung verständlich,
- sind einer Nationalsprache entlehnt oder durch Wortbildung aus lateinisch/griechischen Morphemen gebildet.

Latein wird gern als „Muttersprache Europas“ bezeichnet (s. Volmert 2002: 23):

...Entwicklung der lateinischen Sprache von der Antike bis in die heutige Zeit: Latein als Volkssprache, als Sprache der Kanzleien und Fürstenhöfe; als Sprache der Klerus in Europa und in der Welt; schließlich als Sprache der Wissenschaften, die in der Zeit der Renaissance europaweit eine neue Blüte erlebte.

Latein kann also als die Basissprache Europas bezeichnet werden, wobei der Einfluss in der Romania nicht zu übersehen ist, aber auch heute davon ausgegangen wird, dass der englische Wortschatz ca. 56-60% romanisches Wortgut enthält (Scheler 1996: 152 ff., zit. nach Volmert 2002: 40). Das Deutsche wurde zwar nicht so stark romanisiert, aber der ständige Kontakt mit dem Lateinischen hat seine Spuren hinterlassen (Volmert 2002: 40). In diesem Zusammenhang ist die Rolle der Internationalismen zu sehen, wobei das Graecolateinische auch seine Einflüsse außerhalb Europas hatte: in Afrika, in Australien, vor allem in Nord-, Mittel- und Südamerika, aber auch in Indien, Indonesien und Ostasien, wie ich unten am Beispiel Japans noch näher erläutern möchte. Weiter schreibt Volmert (2006: 149):

Griechisch und Latein hatten also ... eine Schlüsselrolle bei der Ausbildung dieser europäischen Koiné; aber dies ist nicht zu verstehen im Sinne einer abgeschlossenen historischen Entwicklung, sondern es zeigt sich in einer für die Gegenwart und Zukunft höchst virulenten Aktualität und Produktivität.

Nach Braun (1990) gibt es ca. 3500 – 4000 Internationalismen im europäischen Wortschatz. Um einige Beispiele zu nennen, sei folgende Tabelle auszugsweise angeführt (aus Volmert 2004):

Deutsch	Englisch	Französisch	Italienisch	Polnisch	Russisch
Konfirmation	confirmation	confirmation	confermazione	konfirmacja	konfirmacija
Prädestination	predestination	prédestination	predestinazione	predestinacja	predistinacija
Religion	religion	religion	religione	religia	religija
Reliquie	reliquiae	relique	reliquia	relikwia	relikvija
Testament	testament	testament	testamento	testament	[zaveschanie]
Auditorium	auditorium	auditorium	auditorio	audytorium	auditorija
Definition	definition	définition	definizione	definicja	definitcija
Examen	examen/-inary	examen	esame	egzamin	ekzamen
Kolloquium	colloquium	colloqui	colloquio	kolokwium	kollokvium
Manuskript	manuscript	manuscript	manoscritto	manuskrypt	manuskript
Rektor	rector	recteur	rettore	rektor	rektor
Experiment	experiment	[expérimenter]	esperimento	eksperyment	eksperiment
Extrakt	extract	extrait	estratto	ekstrakt	ekstrakt
Medizin	medicine	[médicinal]	medicina	medycyna	medicina
Operation	operation	opération	operazione	operacja	operacija
Dimension	dimension	dimension	dimensione	[wymiar]	[izmerenie]
Proportion	proportion	proportion	proporzione	proporcja	proporcija
Quadrat	quadrat/-uple	quadrat	quadrato	kwadrat	kvadrat
Quotient	quotient	quotient	quoziente	[iloraz]	kvota
adoptieren	adopt	adopter	adottare	adoptować	adaptirovat'
degradieren	degrade	dégrader	degradare	zdegradować	degradirovat'
Dokument	document	document	documento	dokument	dokument
Justiz	court of justice	justice	giustizia	[sądowictwo]	justicija
Kaution	[bail]	caution	cauzione	kaucja	kaucion
Kontroverse	controversy	controverse	controversia	kontrowersja	kontroversija
Administration	administration	administration	amministrazione	administracja	administracija
Audienz	audience	audience	udienza	audiencja	audiencija
Diktatur	dictatorship	dictature	dittatura	dyktatura	diktatura
Fiskus	fisc/fisk	fisc	fisco	fiskus	fisk
Regiment	regiment	régiment	reggimento	[pułk]	[polk]
Dekoration	decoration	décoration	decorazione	dekoracja	dekoracija
Eloquenz	elocution	elocution	eloquenza	elokwencja	elokvencija
Komposition	composition	composition	composizione	kompozycja	kompozicija
Literatur	literature	littérature	letteratura	literatura	literatura
Perspektive	perspective	perspective	prospettiva	perspektywa	perspektiva
Skulptur	sculpture	culture	scultura	[rzeźba]	skulptura

Fremdwörter und Internationalismen werden von der Parole einer Sprache in die Parole einer anderen Sprache übernommen. Dabei erfolgen Assimilationen im Übernahmeprozess, der längere Zeit, sogar Jahrhunderte anhalten kann, in der Lautung, Schreibung, Semantik und Pragmatik nach der systemlinguistischen Einteilung. Man kann auch von einer Assimilation in der interkulturellen Kompetenz (House 1998: 62ff.)<sup>6</sup> der Sprecher reden. Hier spielen Einstellungen Akzeptanzen und auch

<sup>6</sup> Nach Canale und Swain (1980, zit. nach House 1998, 62) wird die, wie sie hier heißt, *Kommunikative Kompetenz* gebildet aus den vier Bereichen: a) „grammatische Kompetenz“, b)

der Nehmersprache aufgenommen. Es ist offensichtlich, dass die beiden Sprachsysteme, der Geber- und der Nehmersprache, da sie ganz unterschiedlich sind, dem Wort in dem jeweiligen System einen unterschiedlichen Bedeutungs- und Gebrauchsumfang zuweisen.

Dieser Prozess ist vor allem gekennzeichnet durch einen Zeitfaktor. Innerhalb dieser Zeit laufen die diversen vielfältigen Integrationsprozesse ab. Durch dieses Prozess-Verständnis kann man verschiedenen Sprechern/ Hörern oder Gruppen mit ihren unterschiedlichen Gebrauchsbedingungen einfach verschiedene Stadien auf dem Kontinuum zuweisen, so befinden sich eben Jugendliche in einem anderen Stadium auf dem Kontinuum als etwa 60-Jährige, Jugendliche haben das Wort schon ins eigene System integriert, Ältere sind auf dem Kontinuum bei der Stufe Fremdwort. Dieses kann aber wiederum je nach Thema unterschiedlich sein.

Dieses Modell des Prozessverständnisses ermöglicht vor allem eine Einordnung eines Fremdwortes in der Vielfalt der Integrierungsmöglichkeiten, als graphemische oder phonemische, als morphologische oder inhaltliche Integrierung, als schicke Nuance eines Begriffs oder festgelegtes Fachwort. Je nach dem Filter, den es durchläuft, ändert sich das Wort. Es ermöglicht auch, einen sprachlichen Punkt zu beschreiben, bis zu dem ein Fremdwort eingegliedert sein muss, um Kreativität und Kombinierbarkeit mit neuen Elementen oder Neuschöpfungen zu ermöglichen. Jedes einzelne Fremdwort hat ein solches Integrationskontinuum, auf dem die Eingliederungsgeschichte in die entsprechende andere Sprache abläuft.

Ein *Fremdwort* wird aus der Parole der Geber-Sprache, eines bestimmten Sprachsystems, gerissen und in eine andere Sprache gebracht. Die Verwendung ist oft nur auf wenige Gebrauchssituationen in der Parole der Nehmersprache beschränkt, sei es um einem Produkt mehr Attraktivität zu verleihen wie ドリンク aus engl. *drink* oder ライス aus engl. *rice* (ライス ist Reis, wenn er auf dem Teller als カレーライス oder zu einem europäischen Gericht, ご飯, wenn er in der Schale zum japanischen Essen serviert wird), sei es, weil der Ausdruck in dieser Nuance in der Nehmersprache nicht vorhanden ist: スポーツカー, オープンカー, ミルク statt 牛乳 auf alle Fälle für Kaffee-Milch, オイル statt 油, wenn es sich um importiertes Speiseöl handelt. Der inhaltliche Umfang des Wortes ist, zumindest anfangs, immer geringer als der in Gebersprache. Ein Fremdwort muss dann in das neue Sprachsystem eingegliedert werden, wobei es sich wiederum mit neuen anderen Inhalten anreichern kann. Dazu bedarf es Zeit und der Verwendung in der Parole, d.h. einer Aktiviertheit im Sprachgebrauch. Nach einiger Zeit wird das Fremdwort entweder wieder verschwinden, wenn es ein kurzlebiges Modewort oder ein aus aktuellem Anlass gebildetes Wort war, oder es wird in das neue Sprachsystem eingegliedert.

Dieser Prozess ist linguistisch hoch interessant und wie oben ausgeführt sehr vielfältig, und läuft recht unterschiedlich in verschiedenen Sprachen zu verschiedenen Zeiten bei bestimmten Sprechern/ Hörern ab. Für die Beschreibung dieses Prozesses der Eingliederung sind nicht bestimmte Benennungen wie *Fremdwort* oder *Lehnwort* nötig, sondern eine mehrschichtige Beschreibung des Kontinuums. Ein konkretes detailliertes Beschreibungsinstrumentarium steht im Moment noch aus. (Näheres hierzu in Werner 2003).

### 3. Das Japanische

Auch im Japanischen gibt es eine lange Tradition fremde Wörter zu integrieren. Während sich jedoch in der deutschen Sprache über mindestens 2 Jahrtausende hin ein nie versiegender Einfluss von außen bemerkbar machte, gab es in Japan allerdings kein stetige Übernahme wie im Deutschen, sondern verschiedene Wellen aus verschiedenen sowohl sprachsystematisch, als auch kulturell völlig anders strukturierten Sprachen. Die Integration beginnt im 7.Jh mit der Einführung der chinesischen Schrift zusammen mit dem Buddhismus. Im 14./ 15.Jh. erfolgt eine Welle von spanischen und portugiesischen Wörtern zusammen mit den Gegenständen und der Bibel. Nach der langen Abschließung, in der nur wenig einsickert, ist die nächste Welle Holländisch (und Deutsch, da viele Deutsche auf den holländischen Schiffen kommen), die so genannte *Rangaku*, die besonders im Bereich Medizin und den damaligen Erfindungen und Neuigkeiten. In der folgenden Zeit der Öffnung und Modernisierung, der Meiji-Zeit und Taisho-Zeit, flossen massenhaft fremde Wörter nach Japan, z.T. zusammen mit für die Japaner neuen technischen und kulturellen Errungenschaften. Teils wurden die Wörter ins Japanische übersetzt, wie Eisenbahn (tetsudo) oder aber nach der Aussprache im japanischen Silbenschrift Katakana geschrieben, wie ミシン mishin (engl. (sewing) machine = Nähmaschine).

Während und vor dem 2. Weltkrieg war Englisch verpönt und es wurden fast alle Fremdwörter ins Japanische übersetzt, z.B. auch die Fachwörter im Baseball, die heute alle Japanisch sind.

Ab den 1950er Jahren kamen mit den Besatzern und der amerikanischen Kultur und Politik dann ganz verstärkt Anglizismen nach Japan, die heute wie alle Fremdwörter nach einer Verordnung des japanischen Kultusministeriums von 1946 in Katakana geschrieben werden müssen. Nach dem Fremd-Wörterbuch von Motwani ist in den letzten Jahren für ca. 90% der Fremdwörter die Gebersprache Englisch bzw. Anglo-Amerikanisch.

In der Wissenschaft werden die Kango (aus dem Chinesischen eingeführte Wörter) nicht als Fremdwörter eingestuft, und auch in meinem Seminar konnten die Studenten ganz klar durch Umfragen und Interviews herausarbeiten, dass die alten chinesischen Kango der 1. Phase nicht als Fremdwörter empfunden werden.

Weiterhin konnte festgestellt werden (Oda, in Werner 2003), dass Jugendliche Anglizismen nicht als solche empfinden, sondern sie als „Neu-Japanisch“ bezeichnen.

Von der Kenntnis des Wortschatzes her, wurde sowohl im Deutschen, als auch im Japanischen festgestellt, dass das Alter der Sprecher nicht maßgeblich ist. Manche Fremdwörter wurden von älteren Sprechern zu einem höheren Prozentsatz erkannt als von Jüngeren (Hofmann (2002: 246): E-Commerce, Park and ride, Streetworker im Deutschen; Werner (2003: 12): ブルー).

### 4. Zum Eingliederungsprozess

Fremdwörter sind einem Prozess unterworfen, der Wörter einer Fremdsprache zu Fremdwörtern und dann irgendwann zu Wörtern der eigenen Sprache macht. Ich möchte hier Beispiele für das Deutsche anführen:

- (1) le bureau → das Buréau → das Büro  
 (2) Delphin → Delfin

Nach der neuen Rechtschreibung hat man die entsprechende Freiheit, das Wort *Delfin* „eingedeutscht“ zu schreiben.

An Beispiel (1) kann man zudem in der Aussprache eine Verschiebung feststellen vom Französischen zum Deutschen, im jetzigen (End-?) Stadium der Übernahme gibt es beide Aussprache- und Akzentmöglichkeiten.

Gute Beispiele für einen ähnlichen Prozess im Japanischen bieten:

- (3) demonstrashon suru → demosuru → demoru  
 デモンストラーションする → デモする → デモル  
 (4) sabotage suru (belegt Taisho-Zeit aus frz.) → → → saboru  
 サボタージュする → → → サボル

An der Schreibung, der Mischung aus Katakana und Hiragana, sieht man schon, dass die Wörter erst als Nomen plus Verb *suru* eingeführt werden. Wenn man *demosuru* als Verb betrachten will, wie das Beispiel 勉強する (vgl. Kawai 1984: 318ff.), so wird das Fremdwort *demo* als Kernmorph, das im Japanischen einem Nomen gleich ist, mit dem Wortbildungsmorph *-suru* zu einem Verb. Man kann diesen Ausdruck auch als ein Wort empfinden und schreiben (*demoru*, *saboru*) und auch in einem einzigen Katakana-Wort schreiben (デモル, サボル). Das wird m.E. eine gewisse Zeit brauchen, die Einführung wird also zeitlich später liegen.

Ein Kriterium dafür, dass ein Wort als Wort der Muttersprache empfunden wird, ist die „Behandlung“ wie ein muttersprachliches Wort, und zwar grammatisch-morphologisch und/oder in der Aussprache und Prosodie (Phonemik, Akzent oder Längung) oder auch in der Wortbildung. Dies kann am Japanischen sehr klar gezeigt werden.

Am Japanischen lässt sich sehr schön zeigen, dass Wörter einer anderen Sprache zuerst als „Fremdkörper“ des Systems (im Gegensatz zum Gebrauch in der Parole!) empfunden werden und nur sehr zögerlich in das eigene Sprachsystem integriert werden. Gleich welche Wortart das fremde Wort in der Gebersprache hat, es wird als Gegebenes, als nicht Veränderbares ins Japanische aufgenommen. Flektierbar sind im Japanischen Verben und Adjektive. Fremde Wörter werden nie als Verb oder Adjektiv übernommen. Dies hat eine lange Tradition, bis in die Zeit der Übernahme der Kanji-Wörter. Es gibt fast kein Verb oder Adjektiv, das eine sinojapanische, also eine On-Aussprache hat. Verben wie *kanjiru* 感じる oder 感ずる sind mutmaßlich auch aus dem „Fremdwort“ 感 *kan* (On-Aussprache) plus *suru* entstanden und später integriert worden und als muttersprachliches Wort empfunden und konjugiert worden.<sup>9</sup> Eines der bekannten Wörter, das in der Literatur immer wieder auftaucht, ist: 御覧ず *goranzu*. Es kommt in einigen wenigen Formen vor wie 御覧じ (藤原: 1994). Es gibt wenige Ausnahmen von Verben, die in On-Aussprache benutzt werden: 力む *rikimu*, 愚痴る

<sup>9</sup> Im Nelson Zeichenlexikon 1997 wird z.B. *isuru* und *kanjiru* auch unter die Kun-Aussprache eingeordnet.

*guchiru*, 皮肉る *hinikuru* (村木 1982: 221).

Verben und Adjektive haben die autochthone japanische Aussprache behalten. Das heißt andererseits, dass ein Kernmorphem – mit der entsprechenden Lautung – aus dem Chinesischen übernommen wurde, als Nomen geschrieben in verschiedenen Lesungen gebraucht, in Kun- oder On-Aussprachen, auch grammatisch-syntaktisch in einer Kernmorphem-Distribution gebraucht wird. Die Adjektive (Keiyōshi 形容詞) allerdings, die ja ein Basis-Bestandteil einer jeden Sprache sind, flektieren im Japanischen und haben alle das Suffix *-ii* (z.B. 美しい *utsukushii*). Sie werden im Kernmorphem mit Kanji geschrieben, das Flexionsmorphem wird in Hiragana angehängt.

In diesem Fall hat man für die Wörter, die keine Kun-Aussprache haben (z.B. 綺麗), eine neue Wortarten-Kategorie geschaffen, die Keiyōdōshi (形容動詞). Diese flektieren nicht und haben eine andere syntaktische Distribution als die Keiyōshi. Sie bilden z.B. die Adverbform nicht mit *-ku* (美しく), sondern mit *ni* (綺麗に).

Wie wir bereits gesehen haben, werden die fremden Wörter als Nomen ins Japanische eingebracht:

z.B.: インフォメーション aus engl. *information*, メンバー aus engl. *member*, シナリオ aus engl. *scenario*, サービス aus engl. *service*, usw. usw.. Sie werden entweder als Nomen gebraucht oder mit *suru* verbalisiert サービスする. Es gibt einige Adjektive, die zu Keiyōdōshi werden: クールな人 aus engl. *cool*, レッドな... aus engl. *red*, ラッキー aus engl. *lucky*, ja sogar eingeführte Präpositionen werden als Nomen (oder Kernmorphem) gebraucht アップする aus engl. *up*, アバウトする aus engl. *about*. Die Wörter werden ans japanische Aussprachesystem angepasst in Katakana geschrieben.

Der Phantasie sind mit Kombinationen aus üblichen japanischen Lexemen und englischen Fremdwörtern, auch mit neuen Wortbildungen 和製語 und Kombinationen von Abkürzungen keine Grenzen gesetzt. Um einige Kombinationsmöglichkeiten anzuführen: Seit der Meiji-Zeit werden gerne japanische mit fremden Lexemen kombiniert: 豚カツ aus dem Kanji für Schwein und *katsu* aus engl. *cutlet*, 文化センター aus dem Kanji für Kultur und *sentā* aus engl. *center*, コピー機 aus engl. *copy* und dem Kanji für Apparat. das aus dem Englischen stammende Fremdwort ドライバー (aus *driver*) etwa kann man mit dem Fremdwort ペーパー aus engl. *paper* zu der japanischen Neuschöpfung ペーパードライバー (= jd., der den Führerschein hat, aber nicht Auto fährt) zusammensetzen. Man kann auch in der Schreibung beliebig die Schriftsysteme kombinieren: Yシャツ, GETする, TBS テレビ, NHK 教育, u.v.m.. Das Japanische ist damit ausgesprochen produktiv und erlaubt eine fast unendliche Zahl neuer Wörter.<sup>10</sup>

In der Jugendsprache sind diese Kreationen besonders häufig, wenn auch nicht so viele englische Wörter gebraucht werden, wie man hätte vermuten können. Um nur einige kurz anzuführen (Oda 2003): „どたキャン (= absagen im letzten Augenblick),

<sup>10</sup> In Japan werden jedes Jahr dicke Enzyklopädien neuer Wörter herausgegeben, etwa IMIDAS oder 現代用語の基礎知識.

マイブーム (eine Mode, die nur „Ich“ habe)“.

Watanabe (2004) kommt bei einem kontrastiven Vergleich der deutschen und der japanischen Sprache der Jugendlichen zu dem Schluss, dass etwa bei Kurz-Mails, den SMS, in Deutschland wesentlich mehr und vielfach stärker Anglizismen gebraucht werden als bei jungen Japanern. Die absolute Zahl der verwendeten Wörter ist zwar auch in Japan beträchtlich, aber die Zahl der verschiedenen Lexeme nicht sehr hoch. Es werden sehr oft Floskeln wie OK oder TY aus engl. *thank you* mit japanischen Ausdrücken oder Wörtern kombiniert bzw. zusammengefügt (Watanabe):

„おっけです [okdesu], おっけだよ [okdayo], ゲットしといて [getshitoite], ミートウ [me too], さんきゅう [thank you], I don't know, ダッシュで [dashde], オウケイ [ok], ゲットした [getshita], アロハ〜 [aloha], OK です [okdesu], ハーイ [hi], プリーズ [please], バースデー [birthday], ラッキー! [lucky]“.

## 5. Fremdsprachenunterricht

Aufgrund der sprachlichen Gegebenheiten und der graphematischen Tradition, aber auch der Lerntradition in Japan, die beim Fremdsprachenunterricht unbedingt berücksichtigt werden sollten, sollten folgende Punkte die Grundlage wichtiger Überlegungen zur Gestaltung des Unterrichts mit Internationalismen sein:

- Im Japanischen werden Anglizismen ans japanische phonologische System angepasst in japanischer Silbenschrift geschrieben, was den Erkennungsprozess stark erschwert und verlangsamt.
- Japanische Deutsch-Lerner haben Englisch als Fremdsprache gelernt und können daher Anglizismen identifizieren, müssen aber die Aussprache-Unterschiede Englisch/ Deutsch bewusst lernen.
- Die L1 Japanisch ist eine Sprache, die nicht einer größeren Sprachfamilie angehört. Deshalb muss zuerst Basiswissen über die Ähnlichkeiten und Beziehungen der indoeuropäischen Sprachen und des Anglo-amerikanischen vermittelt werden.

Besonders der letzte Punkt scheint mir bisher weder linguistisch, noch didaktisch bearbeitet zu sein. Hier wäre zunächst einmal eine grundlegende vergleichende Beschreibung und auch die Vermittlung an die Lehrerseite wichtig zu sein. Trotzdem oder auch gerade deshalb sollte man als Konsequenzen für den Fremdsprachenunterricht Folgendes festhalten:

- Der Wortschatzerwerb lässt sich durch das Bewusstmachen von Internationalismen zeitsparend, lernökonomisch und motivierend gestalten. Dies stellt eine enorme Lern-Erleichterung dar.
- Doch die Lerner brauchen dabei Hinweise auf die Assimilierung, Kombinationsregeln usw. von Internationalismen oder Fremdwörter in die Ziel- und Ausgangssprache (L1 und L3). Dies ist die Anforderung dabei an die Lehrpersonen, an deren Verständnis und Vermittlungsfähigkeit appelliert wird.

## 6. Zum Schluss

Ist es nicht bemerkenswert, wenn neuerdings im Zuge der Globalisierung selbst in den asiatischen Ländern, wie z.B. in Japan, die zur griechisch-lateinischen Tradition gar keine Beziehung haben, über den Umweg des Anglo-Amerikanischen jetzt Begriffe wie „disukashon“ (aus engl. discussion) oder „paburiku“ (aus engl. public) in den öffentlichen Diskurs Eingang finden?

Fachwörter verschiedener Bereiche (Medizin, Jura, aber auch Musik usw.) haben schon längst, seit über 150 Jahren, ganz verstärkt aber in den Nachkriegsjahren ihren Platz in der japanischen Sprache. Die Übernahme der englischen Wörter via Umweg USA ermöglicht nun einer großen Mehrheit der Bürger sich „international“ auszudrücken. Die wechselseitige Befruchtung der europäischen Länder in kulturellen und wissenschaftlichen, aber auch wirtschaftlichen Bereichen und ihre weltweite Auswirkung spiegelt sich natürlich in der Sprache wider. Cum grano salis ist - auch in Japan - die Küche hauptsächlich französisch besetzt, die Musik italienisch, die Philosophie Deutsch, warum die IT und Computerwelt nicht Anglo-Amerikanisch?

In Japan gibt es zwar auch puristische, sprachpflegerische Tendenzen<sup>11</sup>, aber, da es genau wie in Deutschland keine verbindliche Sprachautorität gibt, werden m.E. die Anglizismen, gut sichtbar in Alphabetschrift oder Katakana-Silbenschrift mit Freude und Enthusiasmus in die japanische Sprache eingebaut.<sup>12</sup> Die Anglizismen werden – wie überall - besonders von jungen Leuten gerne gebraucht, da sie (s.o.) als Sozialsymbol fungieren und zur Identitätsfindung wichtig sind. Anglizismen ersetzen die japanischen Wörter nicht, sondern bereichern die Sprache durch neue Wörter mit differenter Konnotation. Sie drücken Nuancen aus, Moden, aber sie sind auch sehr wichtig als Fachtermini, nicht zuletzt für eine Verständigung im internationalen Rahmen. Die Durchsetzung des japanischen gehobenen öffentlichen Diskurses von japanisierten Anglizismen befindet sich in einer steil ansteigenden Kurve. Mir schient in Japan die starke negative Bewertung von Anglizismen in der Öffentlichkeit nicht oder kaum vorhanden zu sein, die Sprachteilnehmer offener für Innovationen.

Natürlich haben globale Diskurse, wie wir sie in der Wirtschaft oder Politik finden, auch über die Sprache hinaus Auswirkungen auf paralinguistische oder sogar auf interaktionale Handlungs-Einheiten. Es ist mir z.B. bei G8-Gipfel in Toyako in Japan im Juli aufgefallen, dass die Sprache der Teilnehmer untereinander und auch in den offiziellen Pressekonferenzen sehr locker, auch im Japanischen fast ganz ohne Höflichkeitsformeln ausfällt (ohne *gozaimasu* usw.), sodass und auch hier „amerikanische“ Gepflogenheiten Eingang finden; und man konnte im Fernsehen mitverfolgen, dass sich asiatische Führer wie der japanische Ministerpräsident Fukuda, der chinesische Staatspräsident Hu Jintao und der südkoreanische Staatspräsident per Handschlag begrüßen. Dies ist einerseits eine Verringerung der Diversität der einzelnen kulturellen Eigenheiten, aber auf der anderen Seite eine große Chance, damit globale Diskurse überhaupt stattfinden können. Und diese sind heute zur Erhaltung des Friedens

---

<sup>11</sup> Die Abteilung Fremdwörter des japanischen staatlichen Sprachinstituts 国立国語研究所 schlägt immer wieder auf veröffentlichten Listen japanische Wörter statt der Anglizismen vor (<http://www.kokken.go.jp/gairaigo/>)

<sup>12</sup> In Japan werden jedes Jahr dicke Enzyklopädien neuer Wörter herausgegeben, etwa IMIDAS oder 現代用語の基礎知識.

und der Umwelt, aber auch eines gewissen Wohlstands unabdingbar.

Die Internationalismen sind das Bindeglied für transkulturelles Handeln. Die Zunahme der Internationalismen im vergangenen Jahrhundert zeugt von zunehmender internationaler Verflechtung von Information und soziokulturellem und politischem Verhalten.

(Corinna Caspar-Terizakis, 2004: <http://www.eurocomcenter.eu>)

# Is There a “Drift” Towards Universal English-Based Rhetorical Patterns?

William G. Eggington

Brigham Young University  
Department of Linguistics and English Language  
Provo, Utah, 84602, USA  
wegg@byu.edu

## Abstract

Preliminary research (Eggington 2004, 1987; Millward 1996, Hinds 1980) indicates that the effect of the English language on international discourse communities is beginning to parallel Classical Latin’s and Classical Chinese’s influence in ways other than rudimentary lexical borrowing. In essence, as Latin and Chinese *were*, English *is becoming* -- particularly in those genres/registers concerned with global information dissemination. The purpose of this paper is to address aspects of this claim with respect to rhetorical patterning by examining a number of sub-claims.

**Keywords:** contrastive rhetoric, language drift, discourse communities, global English.

## 1. Introduction

Preliminary research (Eggington 2004, 1987; Millward 1996; Hinds 1980) indicates that the effect of the English language on international discourse communities is beginning to parallel Classical Latin’s and Classical Chinese’s influence in ways other than rudimentary lexical borrowing. In essence, as Latin and Chinese *were*, English *is becoming* particularly in those genres/registers concerned with global information dissemination. The purpose of this paper is to address aspects of this claim with respect to rhetorical patterning by examining the following four sub-claims:

1. Various scientific, academic, bureaucratic and business global discourse communities are developing standardized forms of rhetorical patterning,
2. The predominant cultural and linguistic influence on these standardized or standardizing rhetorical patterns is derived from the Western European, English-based rhetorical preferences,

3. Some “drift” toward a preference for English-influenced rhetorical patterns is evident in the rhetorical patterns in other languages even though the English-based structures and patterns violate linguistic and cultural conventions in these other languages,
4. This drift can be explained by reliance on recently developed exemplar-based models of natural language processing (Skousen 2002, 1996).

After developing these sub-claims, I will attempt to support them by relying on (1) historical precedent, (2) the process of normative standards in written discourse communities and (3) emerging data that tends to verify the third sub-claim. In particular, I will report on recent attempts to move beyond limited anecdotal supporting evidence through expansion of qualitative and quantitative data bases.

We will conclude with a discussion of the tensions created by this global linguistic phenomenon, a phenomenon which can be viewed as either a natural consequence of the English language being the lingua franca of many global discourse communities, or further evidence of linguistic imperialism.

## **2. The Story behind the Research**

A few years prior to commencing my graduate studies in 1980 at the University of Southern California, I lived in South Korea for two years serving as a Mormon missionary. I acquired fairly communicative Korean. This allowed me to claim the Korean language as a language requirement in my graduate program. To complete the requirement, however, I had to pass a Korean language examination set by the University’s graduate program. The examination consisted of translating from Korean to English a linguistics article. I worked with a native Korean professor who would act as my examiner. I chose a Korean language article from a Korean linguistics journal that explored some aspect of Korean syntax using transformational grammar as a theoretical foundation. The author of the article was a native Korean who had recently completed his PhD in Linguistics at an American university. Upon completing the translation, I gave it to my Korean advisor. He read the Korean language article and compared it to my translation. He said my translation was adequate, but wished I had chosen a better article because the article I had selected “didn’t sound Korean.” I pointed out that the article was written by a native Korean. He replied by stating that even though it was

written in Korean, it was structured like an English article, not a Korean article.

This observation intrigued me and led to investigating traditional Korean rhetorical extended discourse structures versus English-influenced Korean discourse structures which in turn led to a 1987 article (Eggington 1987) that claimed that:

In genres and registers used by academic/scientific global discourse communities, the rhetorical patterns of many languages are being affected by the register-specific rhetorical patterns of the English language.

As noted above, the remainder of this paper will explore a number of sub-claims associated with this conclusion.

### **3. Sub-Claim 1: Various scientific, academic, bureaucratic and business global discourse communities are developing standardized forms of rhetorical patterning.**

Beginning with Kaplan's 1966 work in contrastive rhetoric, sufficient evidence has been offered to suggest that each culture exhibits preferences for the ways in which extended discourse is developed for specific registers. Preferences include broad descriptors and concepts such as degrees of directness, direct "linear" development vs. indirect circumlocutions, stripped down vs. elaborate styles, and writer responsible encoding vs. reader responsible decoding. Subsequent studies have shown that "discourse communities," or "communities of practice" also exhibit rhetorical preferences. As Herzberg (1986:1) suggests, "The use of the term 'discourse community' testifies to the increasingly common assumption that discourse operates within conventions defined by communities, be they academic disciplines or social groups." Swales (1990) tells us that a discourse community:

- "has a broadly agreed set of common public goals,
- has mechanisms of intercommunication among its members,
- uses its participatory mechanisms primarily to provide information and feedback,
- utilizes and hence possesses one or more genres in the communicative furtherance of its aims,
- has acquired specific lexis,
- has a threshold level of members with a suitable degree of relevant content and

discoursal expertise” (Swales 1990:24-27).

Obviously discourse communities operate as agents of linguistic standardization. For someone to enter and maintain credibility within such a community, he or she must conform to certain conscious and subconscious behavioral and communicative norms. In broad terms, the academic discourse community exhibits language preferences that include marked or non-normal language at lexical, morphological and syntactical levels. For example, in normal speech, it is natural or unmarked for me to say, “I looked at the ball.” However, in academic discourse, “ball” becomes “spherical object,” “looked” becomes “observed,” and then it is reformulated into the nominalized form, “observations.” Syntactically, passive voice is preferred over active voice thus transforming “I looked at the ball” into “Personal observations were conducted vis-à-vis a designated spherical object.” As we shall discuss below, similar standardization mechanisms exist at the discourse level. As a discourse community expands in both numerical size and geographic reach, its local, then regional, then national and finally global influence expands accordingly – which leads us into the second sub-claim of this paper.

#### **4. Sub-Claim 2: Various scientific, academic, bureaucratic and business global discourse communities are developing standardized forms of rhetorical patterning.**

The spread and influence of the English language has been well documented (Graddol 2006). Currently and for the foreseeable future, English exists as the dominant language within the world’s information storage and retrieval systems. Obviously, much new knowledge is developed and transferred within advanced education systems such as universities. Universities are not only centers of learning, but also dispersal agents for the dominance of English within academic discourse communities. As Graddol shows, all but one of the top ranked 20 universities in the world operates in English (Graddol 2006: 75).

In reaction to the dominance of English within academic discourse communities, many non-English-as-first-language nations have enacted language education policies that foster English language development at all levels of education. For example, a young South Korean will be exposed to English in elementary school, secondary school and at the university level. Indeed, recent changes in Korean language policy have

mandated a significant English presence within higher education to a point where English is the primary medium of instruction in many classes. In summary, probably as a natural consequence of their primary functions, universities foster discourse communities and discourse communities foster standardization. With globalization trends, prestigious academic discourse community English is being spread to non-English speaking nations where young people are receiving a prolonged and intense exposure to the standardizing influence of a powerful English register. This phenomenon begs the question, “How is this English dominance and standardization process affecting other forms of communication, particularly first language performance?” We will address this issue as we discuss the next claim.

**5. Sub-Claim 3: Some “drift” toward a preference for English-influenced rhetorical patterns is evident in the rhetorical patterns in other languages even though the English-based structures and patterns violate linguistic and cultural conventions in these other languages**

As noted above, my early inquiries in this area of investigation resulted in a paper published in 1987. In that paper, I analyzed a Korean letter to the editor of *The Korean Times* that had been written and published in 1983. The letter is reproduced below with paragraph numbers inserted for analytical convenience. Note how the major rhetorical purpose and claims for the letter are provided mid-text in paragraphs 4 – 6. Paragraphs 1 – 3 come at the major claim tangentially. The author then runs away from these claims in paragraphs 7 and 8 while humbly accepting partial responsibility for the problem in paragraph 7. The text concludes with a plea to administrators in paragraph 9.

1. The Ministry of Home Affairs is planning to lengthen the period of training for public officials from 3 days to 6 days per year in order to solidify the spirituality of the public officials. The training is to be conducted at the Spiritual Cultural Institute which is rendered in English as the Institute for Korean Studies.
2. A new meaning of “national” is attached to the word “spiritual.” Perhaps this comes from the term, “Spiritual Culture.”
3. A member of the Korean Alphabet Society complained that the architectural design of the Institute for Korean Studies represents a Buddhist Temple and thus is not Korean. This is not so because Buddhism, though imported from India, is a Korean religion. Likewise Christianity is a Korean religion.

4. Any attempt to label what is national and what is foreign fails.
5. Perhaps too much emphasis on nationalism may do more harm than good.
6. Instead of inspiring nationalism we should be appealing to universal reason and proper moral conduct. The civil spirit must take precedent over the national spirit.
7. I am reminded of this when, changing trains at the subway, I witness the rush to occupy seats on route to the sports center where the Olympic Games are to be held. How do we enhance the nation's prestige through a sports event? As a teacher, I am partly responsible for this situation.
8. Once you catch a taxi you have to listen to the loud radio controlled by the driver.
9. Dear administrators, please do not talk about spiritual things unless you are interested in implementing concrete ethical conduct (as cited in Eggington 1987).

This text is typical of a traditional preferred reader-responsible (Hinds 1987) Korean rhetorical style where one avoids overt directness by circling the claim and then retreats from that claim lest readers consider the writer as being overly aggressive.

In the 25 years since 1983 to 2008, English and Western influence in South Korean culture and within its educational systems has been pervasive. Thus it is not surprising that a recent topical equivalent of the 1983 letter bears little resemblance to the rhetorical structure in the 1983 text. The text below is a letter to the editor published in *The Korean Times*, 13 May 2008. Paragraph numbers are inserted for analytical convenience. Note how the Korean author immediately offers his main claim in paragraph 1. Paragraphs 2 – 4 support that claim through direct and linear logical development that is akin to what may be found in any letter-to-the-editor of any English newspaper in an English-as-first-language nation. In the final paragraph, the author directly and aggressively reasserts and expands his claim concluding with an exclamatory flourish.

Dear editor,

1. Regarding an editorial, "Opulent Officials," published in the April 26-27 edition of *The Korea Times*, I agree with the idea that ethical reform is needed rather than emotional rebukes, because mere emotional rebukes or sharp criticisms alone do not bring any positive changes to society.

2. All of us rightly know that being rich in a capitalistic country like Korea is not to be blamed, but to be admired if it is "lawfully" accomplished.
3. However, though the officials claim that their fortunes are made by legal investments, many people are suspicious about whether or not they have amassed their fortunes through illegal real estate dealings.
4. Illegal speculation is not just a personal crime; it is a serious crime ruining the whole economy of the country. Whether the group, who didn't keep the law, is to be expected to use their power properly to serve people who are weaker and poorer is hard to believe.
5. However, the biggest problem over this matter is that we don't have a concrete solution for implementing ethical reform in the political field. Actually, in my opinion, not only politicians, but the whole society needs to be ethically reformed. These days our society seems to be unashamed of breaking rules. People would rather brag about their accomplishment regardless of its unlawfulness. What a shame!

This letter is also typical of many contemporary Korean texts as well as being one that would fit comfortably in a Western, English newspaper. Perhaps there has been a change or drift in a preferred rhetorical pattern, and the new pattern resembles English-based directness regardless of the original language.

Similar anecdotal evidence is provided for the academic register by various scholars. Widdowson (1979:61) claims that:

Scientific exposition ... structured according to certain patterns which, with some tolerance for individual stylistic variation, imposes a conformity on members of the scientific community no matter what language they happen to use.

In 1981, for German, Michael Clyne states that:

there appear to be some disciplines (e.g., mathematics, engineering) in which German scientists have adopted a basically linear discourse structure. This may be conditioned by the discipline or by leadership in the discipline of English speakers. In other fields of science (e.g., chemistry), the non-linear structure is quite common in German (Clyne 1981:64).

For Japanese:

it has been pointed out that some ESL student writers believe that English is more logical or advanced than their native language. Moreover, the rhetorical patterns employed by Japanese writers and recommended by writing specialists in Japan increasingly model after English” (Hirose, 2003; see also Kubota, 1992, 2002a).

Also for Japanese, Ahn (1996) suggests that:

in spite of differences in writing theory between English and Japanese, the changes in Japanese lifestyle have gradually forced Japanese language teachers to follow or introduce the Western writing methodology, especially over the past 20 years or so (Ahn 1996:69).

Finally, for Filipino:

as a general rule, the techniques employed in Filipino were borrowed from English communicative arts in terms of paragraph development and theme writing, since the skills were considered intuitively transferable from one language to the other (Gonzales and Fortunato 1995:88).

As the evidence provided in this paper suggests, a strong argument can be made for an English-based rhetorical structure that is “trickling” down to other languages even if the English-based structures conflict with traditional styles and cultural values. Some have claimed that this phenomena is a result of linguistic imperialism and that:

the demands that the academic world imposes on speakers of English as a second or other language to be published may lead to privilege English and its characteristics over any other language (Hands and Cosse 295).

This may be the case although an alternative explanation can be found in applying notions of natural language processing through analogical modeling of language as described below in the final claim for this paper.

**6. Sub-claim 4: The drift toward English can be explained by reliance on recently developed exemplar-based models of natural language processing (Skousen 2002, 1996).**

In recent times, the “language-as-rule-based activity” concept has been found wanting in terms of explaining much of what we know about language. Instead, natural language processing studies suggest that analogical modeling of language offers a far more robust accounting of what is actually happening when we process and acquire language.(see Skousen 2002, 1996). As Robinson explains:

Analogical or similarity-based reasoning uses a database of stored examples to draw probabilistic influences directly, without rule induction or (statistical or ‘neural’) learning. Novel instances are classified and outcomes are predicted on demand, based on prior experience of similar situations (Robinson 1995:249).

If we acquire language patterns through surface level processing, then it is likely that we will sub-consciously model frequent and prestigious language patterns. Thus, a Korean student who has been reading English texts containing English rhetorical structures since early elementary school could simply acquire the English rhetorical structures as part of natural language acquisition. In addition, English-based rhetorical patterns could be the only rhetorical patterns overtly taught throughout a student’s educational experience. This conscious and sub-conscious acquisition of English rhetorical structures is a natural consequence of global communicative needs.

**7. Conclusion**

The major claim for this paper has been that:

In genres and registers used by academic and scientific global discourse communities, the rhetorical patterns of many languages are being affected by the register-specific rhetorical patterns of the English language.

I have attempted to support that claim by reviewing four sub-claims that hopefully fulfill their intended purpose. One should note, however, that the evidence I have provided to support this claimed English-influenced drift in the rhetorical structures of

other languages is qualitative and anecdotal. Although the Analogical Modeling concept provides a strong theoretical foundation, the claim needs to be supported by large scale empirical mapping of that drift. One way to accomplish this task would be to choose a specific academic register that has existed across a range of languages for at least 100 years. Then a large historical corpus would have to be created for the register in each of the targeted languages with 10 year samplings. A similar contemporary corpus would need to be developed in each language. Having established comparative corpora, various quantitative and qualitative research instruments could be applied to the corpora in order to track rhetorical drift. Until such a project is undertaken, mapping rhetorical drift and the influences on that drift will be vulnerable to subjective interpretation.

# **Foreigner Talk at English Corner: An Intercultural Pragmatic Perspective**

**Xinren Chen**

Nanjing University, China  
School of Foreign Studies, Nanjing University, Nanjing 210093, China  
cxr3354182@163.com

## **Abstract**

Foreigner talk is primarily a topic of study in second language acquisition. The related literature consists of both descriptive and explanatory accounts. In the former case, the researchers are primarily concerned with the formal structure of the simplified register, its differences from motherese, and its various roles in assisting comprehension. In the latter case, scholars try to probe into the factors that trigger the use of foreigner talk as realized in the form of input and interactional modifications and how these functions are performed in native-nonnative conversation. Another line of research, sociolinguistic by nature, dwells on the attitudinal aspect of foreigner talk. A review of the existing studies indicates that researchers' attention has predominantly investigated foreigner talk in classroom settings and its role in facilitating SLA. However, no serious attempt has been made from the pragmatic point of view to address such questions as how the use of foreigner talk can be viewed as a matter of linguistic adaptation that native speakers make to satisfy their various communicative needs; nor is there any study available that addresses the use of foreigner talk to mark the role relationship between the speakers. In this connection, the present paper undertakes an empirical study of foreigner talk in a new setting -- English Corner in China. Through the analysis of the collected data, the author intends to argue that foreigner talk represents a form of multi-facet linguistic adaptation, in that (1) foreigner talk promotes the conversation between native speakers and non-native speakers more as an event of intercultural communication than as an L2 learning event; (2) foreigner talk involving native speakers' conversational dominance is an adaptation to their conversational role; and that identity-laden foreigner talk is found interadaptable with the native speakers' and their Chinese interlocutors' cultural or national identity .

**Keywords:** foreigner talk, intercultural pragmatics, identity, adaptation.

## **1. Purpose of this study**

Foreigner talk (FT for short) has primarily been a topic of study in second language acquisition (SLA). The related literature consists of both descriptive and explanatory accounts. In the former case, the researchers are primarily concerned with the formal structure of the simplified register (e.g. Ferguson 1971; Long 1981a), its differences from motherese (Ellis 1985; Freed 1978, 1980), and its various roles in assisting comprehension (e.g. Ellis 1985; Issidorides and Hulstijn 1992). In the latter case, scholars try to probe into the factors that trigger the use of foreigner talk as realized in the form of input and interactional modifications (e.g. Scarcella and Higa 1981; Long 1981a) and how these functions are performed in native-nonnative conversation. A review of the existing studies indicates that researchers' attention has predominantly concerned foreigner talk in classroom settings and its role in facilitating L2 acquisition. However, no serious attempt has been made from the pragmatic point of

view to address such questions as how the use of foreigner talk can be viewed as a matter of linguistic adaptation that native speakers make to satisfy their various communicative needs; nor is there any study available that addresses “the use of foreigner talk to mark the role relationship between the speakers” (Ellis 1985: 137). In this connection, the present paper undertakes a study of foreigner talk not in classroom setting but at English Corner, a familiar setting in China’s big cities. Within the adaptationist-theoretical framework (Verschueren 1999), the author intends to reveal that foreign talk in this context is a mode of linguistic adaptation oriented towards the promotion of asymmetrical intercultural communication.

## **2. Literature review**

### *2.1 Defining foreigner talk*

The study of foreigner talk can be traced back to Ferguson (1971), who discovers the linguistic similarities among motherese, foreigner talk, and fossilized forms of interlanguage. Ferguson and DeBose use “simplified registers” as a cover term for those varieties of language used by members of a speech community towards those whose knowledge of the language is less than normal (Ferguson & DeBose 1977: 100). There are two major types, one being baby talk (the variety of language that is regarded by a speech community as primarily appropriate used for addressing young children) and the other being foreigner talk (the variety of language used for addressing foreigners (Ferguson & DeBose 1977: 102-103).

It should be noted that in most cases, foreigner talk is quite different from “baby talk”. Baby talk used by adults is characterized mainly by some phonetic traits typical of early child speech (“pwetty boidy,” “wittle wun,” etc.), baby words such as *tum-tum*, lots of repetition, copula omission, and use of third person address instead of first and second person (“baby give daddy a kiss”). By contrast, foreigner talk often possesses some phonetic traits of L1. Instead of using baby words, it remarkably involves grammatical distortions, such as lack of inflection, use of preverbal “no”, drop of articles, and subject-verb disagreement. Thus, it differs from baby talk although both entail some simplifications, including slow speech rate and the use of high-frequency vocabulary.

### *2.2 Foreigner talk and SLA*

Foreigner talk is a common topic of study in second language acquisition (SLA). The existing literature seems to be predominantly concerned with foreigner talk in classroom settings and its role in facilitating SLA. According to Ellis (1985:297), native speakers (NSs) tend to adjust their normal speech when addressing foreign learners in

order to facilitate understanding. These adjustments, which constitute ‘foreigner talk’, may aid acquisition by ensuring that the learners obtain comprehensible input.

Many studies characterize “foreigner talk” on the basis of native speaker’s simplifications including shorter utterances, lower syntactic complexity, or avoidance of low frequency vocabulary (e.g. Arthur et al 1980). However, Long (1983) argues that NSs modify not only their speech to non-native speakers, but also various features of the interactional structure or their conversations with them, by making clarification requests or giving comprehension checks, for example. He labels these inputs input and interactional features respectively (Long 1981a). The input features are of two types: (1) those that involve simplifications within the grammatical rule structure of the language, and (2) those that involve simplifications leading to ungrammatical speech. Interaction features consist of the specific discourse functions performed by native speakers.

The author of this study, however, would not consider the interactional features as essential to the delimitation of foreigner talk. There are two reasons. One is that these features occur in all kinds of conversations. The other is that their frequency does not count so much since there may be too many factors triggering their occurrence. Instead, this paper would extend the notion of foreigner talk in a different direction. Specifically, we would consider its role in defining the relation between the interlocutors and identity negotiation and its relation with identity claim and ascription since it is employed towards people coming from different linguistic and cultural background. “Foreigner talk is not to be thought of a static, fixed set of features, but as dynamic, changing in accordance with various situational factors.” (Ellis 1985: 133) The relational notion of foreigner talk is more of a sociolinguistic issue than of a SLA matter. We will take it up shortly in 2.3.

Thus, our concern would prompt explanations for the use of foreigner talk. We need to consider both why adjustments occur and how they take place. Hatch (1983) suggests that foreigner talk has the same basic functions as motherese. That is, (1), it promotes communication, (2) it establishes a special kind of affective bond between the native speaker and the non-native speaker, and (3) it serves as an implicit teaching mode. Of these, (1) is primary. Our query is that what kind of communication foreigner talk promotes, what kind of bond it establishes between the NSs and NNSs, and to what extent it serves the teaching function.

### *2.3 Foreigner talk and attitude*

The study of foreigner talk is also of great interest to sociolinguists. From the sociolinguistic perspective, foreigner talk, which involves native speakers’ deliberate simplification of their own language when talking to foreigners, is not just easier, slower, louder, or repetitious speech because this universally occurs when one’s interlocutor has difficulties of comprehension. Rather, it is special for its sociolinguistic implications. Often found to be spoken to foreigners considered to be culturally or racially inferior, foreigner talk outside the classroom always carries the implicit and

often explicit connotation of inferiority, baby-talk, or even “monkey-talk” (Lipski 2005) (it is said that in popular culture talking animals or humanoid creatures are often depicted as using the current local versions of foreigner-talk). Thus, it is of the condescending nature, conveying negative attitudes towards the non-natives, such as the superiority of the “self” and the inferiority of the “other”. The latter is shown by the non-natives’ inability to use the L2 language properly (ibid.), which might lead to racial discrimination.

In history, native speakers’ deliberate and insistent use of foreigner talk to underprivileged people including slaves and contract laborers has led to the development of some pidgin and even the formation of many creole languages throughout the world (e.g. Jamaican English creole). The stigmatized variety of the language marks its speakers as less civilized as those who can speak perfect colonizing language.

#### *2.4 Summary*

The preceding review indicates that there are both pedagogical and sociolinguistic studies about foreigner talk. The former are concerned with the formal properties of the simplified register, its differences from baby talk and the role it plays in SLA, whereas the latter explore the sociological connotations of foreigner talk. From the review above, some research gaps emerge:

- a. No serious attempt has been made from the pragmatic point of view to address such questions as how the use of foreigner talk can be viewed as a matter of linguistic adaptation that native speakers make to satisfy their various communicative needs;
- b. Nor is there any study available that addresses “the use of foreigner talk to mark the role relationship between the native speakers and their foreign interlocutors” (Ellis, 1985: 137) ;
- c. The existing studies about foreigner talk generally target its use in classroom setting, which is predominantly a linguistic learning environment, or worksites which involves explicit power relations. However, little attention has gone to settings beyond the classroom, where intercultural communication takes priority over language learning.

Thus, this study locates the use of the foreigner talk at English Corner and probes into its motivation and operation from the pragmatic point of view.

### **3. Theoretical framework of this study**

This study intends to account for the use of foreigners talk within Jef Verschueren’s adaptation theory. According to his theory of linguistic adaptation, conversation, and communication in general, is driven by the goal of satisfying communicative needs (Verschueren 1999:61). Characteristically, talking or using language consists of constantly making linguistic choices, consciously or unconsciously, for language-internal (i.e. structural) and/or language-external reasons (1999):

- a. These choices are made at every possible level of linguistic structure, phonetic, phonological, lexical, syntactic, textual, etc.
- b. These choices also involve communicative or pragmatic strategies, for example, that of politeness.
- c. These choices are made with various degrees of consciousness.
- d. Choices are made from options that are not equivalent.(e.g. “Be quick” is not equivalent to “Can you be quick?”)

According to Verschueren (1999), pragmatics should be capable of relating the linguistic features at every level of linguistic structuring with the contextual features. To make negotiable choices, competent language users must adapt their language use to the context involved. Here the context is inclusive enough to incorporate the temporal-spatial elements of the situation, the interlocutor(s)’ (linguistic) knowledge, expectations, beliefs, etc., the social distance or power relation between the interlocutors, and so on.

In the light of the theory, native speakers’ foreigner talk at English Corner would be reconsidered as a consciously-made adaptive linguistic choice involving adjustments (mainly simplifications) at various levels for multiple purposes (including conversational dominance, cultural dissemination, L2 acquisition enhancement, and the like), the success of which depends supposedly on their adaptation to the contextual factors concerned, such as their Chinese interlocutors’ L2 proficiency, expectations for L2 cultural input, and identity conditions.

## **4. Methodology**

### *4.1 Research questions*

The fundamental question we like to pursue in this study is whether and how native speakers’ foreigner talk at English Corner works as a mode of linguistic adaptation. The specific questions to be addressed are as follows:

- a. To what extent do native speakers of English at English Corner employ foreigner talk? How does their use of foreigner talk serve their goal of communication?
- b. To what identity do the native speakers adapt their simplified speech in their conversation with their Chinese interlocutors at English Corner?
- c. To what conversational role do the native speakers adapt their simplified speech in their conversation with their Chinese interlocutors at English Corner?

### *4.2 Participants*

This study involved three native speakers of English, whose background information is presented in Table 1. Apparently, the foreigners involved came to the English Corner to help the Chinese learners improve their spoken English. However, our informal interview showed that they had other purposes. They liked to meet more

and different Chinese people (apart from the students they taught at schools or universities), from whom they could know China and the Chinese people better.

Although many Chinese speakers had an opportunity to talk to the three foreigners, only 9 of them happened to become the participants in our study. Their background information is presented in Table 2:

<b>Subjects</b>	<b>Nationality</b>	<b>Age</b>	<b>Gender</b>	<b>Background</b>
NS1	British	In his forties	Male	Teaching English to Chinese at various levels in Nanjing for nearly two years; has been to the English Corner many times.
Ns2	Canadian	Around 50	Male	Teaching English in a suburban university of Nanjing for over one year; visits the English Corner frequently.
NS3	American	In his fifties	Male	Teaching English to Chinese at various levels in Nanjing for nearly two years; often visits Corner.

Table 1: Background information of the 3 native-speaker participants.

<b>Subjects</b>	<b>Gender</b>	<b>Background</b>
CS1	Male	Senior school student, frequently visits the English Corner.
CS2	Female	Primary school pupil, frequently visits the English Corner.
CS3	Male	Junior school student, frequently visits the English Corner.
CS4	Female	Primary school pupil, frequently visits the English Corner.
CS5	Female	Senior school student, frequently visits the English Corner.
CS6	Female	Junior school student, frequently visits the English Corner.
CS7	Male	Company clerk, frequently visits the English Corner.
CS8	Male	Company clerk, frequently visits the English Corner.
CS9	Male	Company clerk, frequently visits the English Corner.

Table 2: Background information of the 9 Chinese participants

According to our informal survey, these participants coming to the English Corner had diverse purposes. The primary one was to practice their oral English. Moreover, since there were almost always foreigners present, they liked to talk with them and got to know their countries. However, quite a percentage of them also took this “English club”, so to speak, as a site for social gatherings. Many of them want to make friends with people who speak good English.

### *4.3 Data collection*

Our data were collected at the English Corner at Gulou, Nanjing, which could be dated back to the 1970s. Residents of the city, mostly primary school pupils, middle school students, and young professionals, come to the Corner on Saturday nights to practice their oral English learn foreign culture, or make friends. Foreigners of varying numbers at Nanjing also join them from time to time.

We used a digital recorder for the data collection. Permission was requested of the participants on the condition that the data collected would be used for academic research purpose only and no mention would be made of their personals. Altogether we recorded three foreigners' conversation with their Chinese interlocutors. There were labelled as follows:

NS1-CS1, CS2

NS2-CS3, CS4, CS5, CS6, CS7

NS3-CS8, CS9

In order to gather background information about the participants, informal interviews were conducted after the data in question were recorded.

### *4.4 Data analysis*

We did transcription for the collected data. After that, our job was to identify foreigner talk employed by the native speakers in the data, based primarily on the formal or linguistic features as presented in Table 3. The reason for this is that since interactional modifications are also found in NS-NS conversations and since there was no base-line NS-NS conversation for comparison, this study excluded the interactional modifications as irrelevant. Instead, we were content-wise, concentrating on what underlined the use of foreigner talk.

Conversation at English Corner is characterized by constant topic change. Thus, not all the conversations occurring between the three native speakers and their Chinese interlocutors would be considered in the upcoming discussion part. The following types of recorded conversations were ticked out:

- a. When the recorded speech was not articulate enough;
- b. When the conversation lasted for only one or a bit more turns, to the extent that no coherent discussion about any topic was possible (this happens when a newcomer joins in the current talk by giving mere greetings or throwing a couple of irrelevant questions);

## **5. Results and discussion**

### *5.1 The use of foreigner talk*

From our recording, it is remarkable that all the foreigners involved in this study invariably spoke rather slowly and articulately, pronounced key words with increased

volume, preferred the use of short sentences and the present tense, and used gestures extensively all the way. This observation alone enables us to conclude that the experienced native speakers were aware of the need to adjust their speech, its speed in particular, to facilitate their Chinese interlocutors' comprehension. Indeed, when interviewed they admitted that they already had this concern in mind. This was also evidenced by their general use of high-frequency vocabulary (by and large, the use of less challenging vocabulary is a less explicit manifestation of foreigner talk than slow speech) and using familiar words to paraphrase those that might cause difficulty, as shown below:

(1) NS2: But I have been skating since I was that high.

CS5: Yah.

NS2: Maybe that we know...

CS5: It's very difficult. I will have a lot of troubles, so...

→ NS2: So did I. I had a lot of troubles when I was skating—when I first started. But you **HAVE TO** *persist* (.) and **KEEP** *doing it*. Make mistakes. Fall down. Stand up and keep going. And eventually you know how to skate.

(2) CS7: So, I think in the future the country to develop itself also depends its population.

NS2: Population?

CS7: Population is also a very important resource.

→ NS2: Yes, but it also (..) can be (...) a detriment. Right? *A detriment. A BAD thing.* You can have too many people, then you have trouble feeding them. You have trouble **RAISING** the standard of living (..) for all of those people.

However, we noticed that NS2's effort to use easy vocabulary was not consistent, because he did use some difficult words or expressions, without trying to make them more accessible to the Chinese participants even when the latter made their difficulty clear to him. Here is an example:

(3) NS2: NO, I have a **CANADIAN** wife. Haahaahaaha. She has learned how to make dumplings. So she goes to Shuguo. She buys something in the freezer and then (.) bring them home. So she wants to learn how to make the **REAL** Jiaozi from the **SCRATCH**. So...

→ CS3: *Scratch?*

NS2: So, some student is supposed to come and help us do that, but that student is **NOW** working at an **INTERNSHIP**. So she is a senior. And she now has a **JOB**. So she may not be coming back to camps. So she may not have an opportunity to show us how to make Jiaozi. Some. The beginning...so...

In (3), CS3 had no idea of what "(from the) scratch" meant and showed his puzzle. However, his request for clarification was ignored by NS2, who seemed more preoccupied with his story telling. This suggested that the use of foreigner talk could be affected by some factors other than the interlocutors' L2 proficiency.

The use of foreigner talk by these native speakers is clearly an active adaptation to the interlocutors' linguistic proficiency characterized by relatively poor listening and

limited vocabulary. It had an immediate effect in facilitating the communication between the native speakers and their Chinese interlocutors. Almost no obvious communication breakdowns could be observed. However, we would argue that there was a more fundamental role that the native speakers' use of foreigner talk served, to which we will turn in the next sections.

It is worth mentioning that our data also showed that foreigner talk sometimes went hand in hand with corrective feedback, as exemplified in (4) and (5):

(4) CS3: How do you celebrate this Spring Festival?

NS2: I *celebrated* the Spring Festival here, in Nanjing. I stayed at Youth Hostel. Jasmine Youth Hostel.

CS3: Eh, have you eat the dumplings?

→ NS2: Have I *eaten* dumplings? Yes, dumplings are my FAVORITE Chinese food.

(5) CS6: Which city are you in?

→ NS2: I, I am, I *lived* in Toronto.

CS6: The famous city of North America.

NS2: A very famous city in North America. Yes.

However, these native speakers provided corrective feedback, though infrequently, not because they were language teachers. In actuality, they showed an overwhelming tolerance for the errors their Chinese interlocutors committed. As indicated in (6) and (7), their error correction occurred mostly when misunderstand might be triggered. This is to further suggest, therefore, the native speakers were more concerned with intercultural communication than with L2 teaching.

## 5. 2 Identity and foreigner talk

NS-NNs communication is unique in that it involves identity issues. At English Corner, as the native speakers engaged themselves in the conversations, they actively assumed various identities, their national cultural identity in particular. Our data indicated that they were aware of these facets of identity and consciously adjusted their simplified speech to them.

To start with, the native speakers identified themselves as belonging to a different country or culture from the one their Chinese interlocutors came from, as shown in (6) and (7):

(6) CS1: Do you like football? There is a football championship tonight by English League, no, British League.

→ NS1: I am not a big fan of football. Sometimes I am annoyed when people say English, that's why you corrected it. It's great, but you are wrong this time, it's English league. *We* have three parts in Britain, England, Scotland and Welsh. But *you Chinese* only have one word "yingguo".

(7) CS9: Yes, learning English is great fun.

NS3: Yes, because many... it is changing very quickly. When I first came up here two years ago, I came across a Chinese, 'hello, I am a Chinese, I am a

graduate student, I would...’ one time, because they are shy, afraid of making mistakes. One time, I looked at my watch and he is trying to find the right word, it’s ok, I looked three minutes...

CS9: Before he found the word. (Laugh)

→ NS3: *Americans* do the same thing.

CS9: Sometimes.

NS3: Yeah ...

CS9: When?

NS3: When they try to speak Chinese.

CS9: Oh, I see.

→ NS3: And *we Americans* do not know music, so we go with ‘ni hao ’ (in a strange tone) or ‘xie xie’ (rising tone). You said ‘xie xie’ (falling tone), right? So we are different.

In (6), NS1 drew a clear distinction in national identity between his Chinese interlocutor and himself by using “we” for self-reference whereas “you Chinese” for the addressee. In (7), NS3 identified himself as being an American. Again, the use of an appositive (“we Americans”) was effective in excluding the Chinese CS9 from his national background.

Not only did they explicitly identify their national or cultural identity, they also reacted to their Chinese interlocutors’ pragmatically inappropriate questions in their own way, as shown in (8):

(8) CS9: How old are you?

→ NS3: What do you think?

CS9: I guess you are...

→ NS3: *Two hundred.* (laugh)

CS9: Eighty years old.

→ NS3: Eighty years old? Thanks a lot. *Thirty-nine! (Vow..) Oh, it’s a joke. In America, all the women are afraid to say they are 40 years old, so all women in America assume that they are 39 and stay 39 the rest of their life. So you have a very old woman, ‘how old are you, great grandmother’, ‘I’m thirty-nine’ (laugh). They’re afraid to be forty.*

Age is a generally taboo topic in the Western culture. Being brought to respond to this taboo, NS3 tactfully averted awkwardness by bluntly infringing upon the Maxim of Quality and telling a joke.

Having identified their own nationality, the native speakers chose to speak in favour of their motherland, as shown in (9):

(9) CS6: I think if I was on the street of Canada, I will feel very—I’m afraid of doing this, because there’s so little people (..) walking in the street. We will fell, feel scared. ((laugh)) No people around.

→ NS2: Ah, yah, CERTAINLY *we don’t have as many police or securities as there are here in China.* But, uh, in general, to be where you are, *it is very safe to be, to walk anywhere in Canada.* So, anyway...

CS6: I have friends who lives in Montreal and she told me that Canada is an ideal place for, for people to spend the rest of their lives. Do you think so?

→ NS2: *Yes! Canada was voted as THE BEST country in the world. (..) three, four, five years ago, I forget which. So, it's always up there in one of the best countries in the world to live in.*

CS6: For what, for what?

→ NS2: *FOR EVERYTHING. Yes. In Canada, one of the best places to live.*

In (9), NS2 showed his pride in his country by emphasizing its safety for travelling and suitability for living in.

Secondly, the native speakers chose to adopt their non-Chinese perspective. Meanwhile, understanding that this could be offensive to their Chinese interlocutors, they often played the opt-out policy. Consider (10):

(10) CS6: So, which country are you from?

NS2: What country do you think I'm from?

CS6: Ehh... (..) not USA.

NS2: Not USA

CS6: Because you said China was VERY BIG, right?

NS2: Yes!

CS5: But USA is BIGGER than China.

CS6: So, I think you... ((laugh))

→ NS2: *Ok, <ok, ok>. The REASON WHY United States is considered BIGGER than China is because Taiwan is NOT considered as a part of China. Everybody in China thinks Taiwan is part of China. But the rest of the world, ok, most of the rest of the world thinks Taiwan is not part of China. But I DON'T want to spend time talking about that.*

CS6: But why politicians often agreed... Our conference said Taiwan is part of China.

→ NS2: *I DON'T want to talk about it. ((laugh)) That's a political issue. I don't want to talk about it, 'cause it will be fighting. Hahaha (..) Or you guys will be fighting, not me. ((laugh))*

In (10), NS2 first identified himself as a non-Chinese person who, like other non-Chinese people, had a different view of Taiwan from the Chinese. Aware that this stand would cause confrontation with CS6, he immediately and insistently opted out from the topic.

Thirdly, the native speakers also behaved as individuals like any other participant. When this identity conflicted with their national identity, they would carefully switch between the two, as shown in (11):

(11) CS1: In China, Chaplin is gaining more popularity.

→ NS1: Yes, but again, *I think* this is political.

CS1: What about Rowan Atkinson? The famous comedy actor.

NS1: Yeah. Shall I tell you the truth? I don't know, this is difficult. I have met him a long time ago, Mr. Bean. My girlfriend's sister married a guy who was the manager of a theatre, and Rowan Atkinson is in the play. This was a long time ago, 25 years ago. 1983, 84. Already he was very famous in Britain. He became famous in 1978. I talked to him, and he is very very boring. Very boring. Very nice, very intelligent, very clever, but very boring. But I liked him, I liked him a lot.

CS1: It's contradictory. Smart, but boring?

→ NS1: He was almost deliberately boring, because *I think* he is very shy, *I thought*, very shy. And he is very conscious of the fact that people want him to be funny. They want him to be funny and *I think* he is deliberately not funny, not funny at all.

CS1: The recent movie is about he going from Britain to France. It is funny.

→ NS1: I saw that. *You think so? I didn't think* it is funny, *he is not popular in Britain. People don't like Mr. Bean.* He is not on British TV. Because Mr. Bean is not made for British sense of humor. It's made for China, Southeast Asia. He is very popular in Southeast Asia, in Malaysia, and they make the movies on the shows mainly for those people. *In Britain, no, it's not our sense of humor. We don't like him.* He was on British TV, Mr. Bean a long time ago. But *we* like other things Atkinson has done. He does many different things.

CS1: He is very popular in China, we like his sense of humor.

→ NS1: Yeah, but you see, *we don't*. He made a TV series, *Blackadder*, very good. The 1<sup>st</sup> series is not so good, but the 2<sup>nd</sup>, 3<sup>rd</sup> and 4<sup>th</sup> are all very good.

In (11) NS1's switch from "I think" to "we don't" was highly suggestive. On the one hand, it indicated that he adopted an individual perspective on the current topic. On the other hand, it suggested that he was conscious of his being a non-native representing a nation. Naturally, NS1's deliberate appeal to the second role in the later part of the discussion might add force to his argument.

From the analysis above, we could see that the native speakers adapted their simplified talk in a way that was appropriate to their identity of various sorts. Considering that the native speakers' goal was to communicate with the Chinese interlocutors, the use of foreigner talk could be seen as an adaptation to the negotiation of their identity to some extent. It is thus partly suggested the native speakers' identity indication in various ways actualizes the interculturality of their foreigner talk with their Chinese interlocutors.

### 5.3 Foreigner talk and conversational dominance

Understandably, native speakers figured as the centres of communication with their Chinese interlocutors at English Corner. They were generally surrounded by varying numbers of Chinese participants.

Much respected and needed, the foreigners as native speakers were in control of their communication with their Chinese interlocutors, to which their use of foreigner talk partly contributed. This was extensively evidenced by our data. Specifically, their conversation dominance was manifested in the following principal ways.

First, the native speakers had a bigger share of conversational turns, as clearly shown in Table 3. This was most evident when they were engaged in multi-party conversations.

Secondly, the three native speakers made a much bigger proportion of speech, even in dyadic conversation, as shown in Table 4. This was so because they frequently provided extended answers or responses to the explicit or implicit questions their Chinese interlocutors raised to them, as exemplified in (12):

(12) CS1: Can you read China Daily?

NS1: Yes, *I use China Daily in class sometimes.*

	Recording 1			Recording 2						Recording 3			
Speaker	NS1	CS1	CS2	NS	CS3	CS4	CS5	CS6	CS7	NS3	CS8	CS9	CS10
Turns of speaking	60	53	7	105	13	10	35	36	16	39	5	28	4
%	50.0	44.1	5.9	48.8	6	4.7	16.3	16.7	7.4	51.3	6.6	36.8	5.3
Total turns	120 (100%)			215 (100%)						76 (100%)			

Table 3: Turn-taking in the NS-CS conversations

	Recording 1	Recording 2	Recording 3
Native speakers	NS1	NS	NS3
Total number of responses	59	68	32
Number of extended responses	50	53	25
Extended responses (%)	84.7 (100%)	77.9 (100%)	78.1 (100%)

Table 4: Native speakers' use of extended responses

Note: Not all the native speakers' turns of speaking were responses; they did initiate conversations sometimes, as shown in the upcoming examples (13) and (14).

In the Chinese participants' eyes, the native speakers were the sources of both authentic linguistic input and cultural information. As supported by our informal

interview, the Chinese participants expected to know the culture of the English-speaking countries and were curious about how foreigners thought about some issues of interest to them, regardless of the fact that some of them might be taboo topics. The native speakers carefully adapted to their expectation and as a result were frequently overinformative.

The fact that the native speakers were respected and needed gave them the freedom and room to say as much as they would, which in effect turned their Chinese interlocutors into listeners as well as initiators most of the time. This again challenged the supposition that the latter came to English Corner with the primary goal to practice their oral English.

Thirdly, the native speakers' conversational dominance was shown by their right of speaker nomination, as shown in (13), by their solicitation of questions, as shown in (14) and (15), and by their refusal to be interrupted or repeat what had just been said, as shown in (16) and (17):

(13) → NS2: *Nice to meet you!*

CS3: Nice to meet me? Yes, thank you!

(14) → NS2: *Hello. COME CLOSER. I don't BITE. So, what's your question?*

CS4: Still, I don't know how to ask you any question.

→ NS2: Well, TRY.

(15) CS4: Excuse me, where are you come from?

NS2: I come from Canada.

CS4: Which city?

NS2: Toronto. It's Canada's largest city.

CS4: Yes, it's a very beautiful city. And I think Toronto...

→ NS2: *Questions. I won't talk unless you ask questions.*

CS3: Yeah.

→ NS2: *So you have to ask questions.*

(16) CS6: Hello.

NS2: So...

CS6: Good evening.

→ NS2: *Yes, I just want to finish my vacations' story. So I came back from Sichuan, Kunming. I came here. It was February, 3<sup>rd</sup>. Then we went to CELEBRATE the Spring Festival at the hostel here in Nanjing. And then on February 12<sup>th</sup>, we went to (.) Hangzhou—the most beautiful city in China. Right?*

(17) CS6: So, what are you talking about?

NS2: My trips. We are talking about my trips around China for the last year.

CS6: You have been in China for one year?

NS2: One year. Yes.

CS6: So, which place have you been to?

→ NS2: Oh, I just did all that. *You are TOO LATE.* (laugh)

Last but not least, the native speakers demonstrated their superiority by giving criticisms or lessons of some sorts, as shown in (18), and (19):

(18) CS1: Because Chinese are very shy. They are good listeners but not good speakers.

→ NS1: Yes. I think it's many things. You got one thing. Chinese culture is quite shy. But I am not sure how true that is. Sometimes Chinese are not shy at all. But I think also it's the way language is taught in China. *You are taught in a very formal way, not conversational. I think it's a mistake.* I hope it's changing. Also it's because they are not used to foreigners. And it's the same when I learn French, German or Russian. You feel more shy when you talk to somebody who is from that culture. You know that he doesn't speak your language, so you must speak English. *My job is to take away these barriers.* Sometimes it's not easy, sometimes it's easy.

(19) (A little girl told a joke)

→ NS3: ... This brings up an idea. *If China learns humour, how to make tourists laugh, then in the next fifty years, you will make billions of more dollars.*

CS9: I agree, I really agree.

→ NS3: Maybe China has a little bit unhappiness during one hundred or two hundred years. So I think, *I seriously, you can teach humour, how to tell a joke, how to make a foreigner laugh.*

From the analysis above, it should be clear that the native speakers were conscious of their conversational role. The use of foreigner talk did not reduce their Chinese interlocutor's respect for them; rather, it served to facilitate their role as authentic sources of cultural input. The native speakers took advantage of their conversational dominance in various ways, which defined the talk at English Corner as a typical example of asymmetrical communication.

## 6. Conclusion

This paper undertook a study of foreigner talk at English corners in a China's big city. Recordings of a sizable quantity of NS-NNS conversation were made and transcribed, with special attention to how native speakers used foreigner talk to manage conversation and how they adapt their simplified speech to identity issues.

The following findings emerged from the analysis of the cleaned data.

-- Foreigner talk facilitated the native speakers' English-corner conversation with their non-native speakers, which was more of an intercultural dialogue than of an L2 learning event, as the native speakers involved were frequently culturally engaged (i.e., conveying cultural information about English-speaking countries) rather than pedagogically oriented (i.e. teaching English vocabulary or grammar). In general, the use of foreigner talk indicated that they cared more about whether the conversation could go on smoothly than whether the non-native speakers could learn authentic and idiomatic L2.

-- The use of foreigner talk by the native speakers at English Corner made it possible for them to distinguish themselves culturally from their Chinese interlocutors. While they adapted their simplified speech primarily to their cultural or national identity, they also showed concern for that of their interlocutors. Moreover, the interculturality of foreigner talk is constructed rather than predetermined.

-- The use of foreigner talk does not impair but facilitates the native speakers' role as authentic sources of cultural input. It helped to define their relation with their Chinese interlocutors as an asymmetrical one. In effect, the native speakers were generally conscious of their conversational dominance and were active in taking advantage of their privilege as native speakers. Thus, it might be suggested that the foreigner talk at English Corner was also characterized by native speakers' superiority in conversational management.

Thus, we would contend that foreigner talk as found at English Corner is not just a matter of linguistic simplification, but is also characterizable in terms of, at the risk of proliferation, native speakers' identity awareness (which serves to distinguish their "self" from "the other") and conversational dominance (which marks their relation with their Chinese interlocutors as asymmetrical).

This research suffers some limitations. First, only three native speakers were involved in the study so that the generalizability of the findings is suspicious. Second, the identification of foreigner talk was based largely on the speech rate of the native speakers' talk. No measurement had been made of that with which they talk to other native speakers. Thus, it was impossible to know whether they talked significantly more slowly to the Chinese participants than to other natives. Thirdly, the Chinese participants were taken as coming from the same population of L2 learners. In fact, there were important individual differences among them in terms of their L2 proficiency. It might have been explored whether the native speakers varied their use of foreigner talk according to the proficiency of specific Chinese interlocutors.

# How bad is "bad data"? In search for the features of orality in Early Modern English legal texts

## Abstract

The paper demonstrates that old texts are useful provided they represent a high degree of orality, and thus document the spoken idiom of the past. The legal texts analysed here (courtroom records, depositions and wills) vary as to the number of the exponents of orality: The features which I search for include structural characteristics (turn-taking, meta-comments) and pragmatic categories (speech acts, discourse markers). It turns out that while all these are characteristic of courtroom discourse and depositions, wills are limited to other pragmatic categories, like performative formulae and deictics. My study reveals that it is both the properties of the data and what the analyst makes of them that determine whether the data can be judged as good or bad.

**Keywords:** historical language data, orality, courtroom records, depositions, wills.

## 1. Introduction

My analysis is a reaction to a similar question posed by Kytö and Walker (2003) in their paper “How bad can bad data be?” However, my approach differs from theirs in a number of ways. While they look at trial proceedings and depositions from *Corpus of (Early Modern) English dialogues 1560-1760*, I deal with three selected genres of Early Modern English legal texts: courtroom records, depositions, and wills. Kytö and Walker address the issue of “textual transmission over time”, whereas I focus on the question of orality of the analysed texts. What I am arguing for in my paper is that, contrary to

Labov's claim, the so-called bad data is not too bad, provided some conditions are met. This is especially true of the historical language materials which have preserved a high degree of orality so that they do not only document the spoken idiom of the past but are also sources of socio-historical information. The features of orality which I will search for in selected Early Modern English courtroom records, depositions and wills include structural characteristics (e.g. turn-taking, legal meta-comments) and pragmatic categories like discourse markers or speech acts.

## 2. Some methodological assumptions

Even a cursory look at Labov's writings reveals a certain contradiction as to the value which language data have for the analyst (interestingly, Labov himself has often pointed to various contradictions and paradoxes in linguistics). One would expect that his claims concerning "bad data", for obvious reasons, apply to historical language materials only. However, his remarks about the nature of and methodological problems with synchronic data are not much more optimistic. So the question arises whether any data is reliable and if so, to what extent. Let's have a look at some relevant statements from Labov's writings:

In *Principles of linguistic change* Labov starts his discussion of the problems with the interpretation of historical data with the following remark:

Historical linguistics rests firmly on the objective and wide-ranging character of its data. But the data that are rich in so many ways are impoverished in others. Historical documents survive by chance, not by design, and the selection that is available is the product of an unpredictable series of historical accidents. The linguistic forms in such documents are often distinct from the vernacular of the writers, and instead reflect efforts to capture a normative dialect that *never* (my emphasis) was any speaker's native language. As a result, many documents are riddled with the effects of hypercorrection, dialect mixture and scribal error, Labov (1994: 11).

He then relaxes his position by coming up with his famous statement to the effect that "historical linguistics can be thought of as the art of making the best use of bad data" (ibid.). Thus, the first methodological question is:

### *2.1. How useful is historical data for the analyst?*

Compare Labov's stand on historical data with the hardly more encouraging statement concerning contemporary language data. He enumerates five methodological axioms which allegedly lead to a methodological paradox and the solution to this paradox is the central methodological problem. The five axioms (concerning the interviewed speakers) are:

- a. amount of attention paid to by the speakers to their speech ;
- b. the vernacular (not every style is of interest to the analyst);
- c. formality of the interview setting, which hinders the observation;
- d. finally, he mentions good data and claims that the only way to obtain good data on the speech of an individual is through systematic observation, cf. Labov (1972: 208-9).

These considerations again raise an important methodological question:

### *2.2. How useful (adequate, precise, representative, statistically significant) is synchronic data for the analyst?*

The answer to this query will be left out here since it is not directly relevant to my topic. One can only speculate that if synchronic data also raise many methodological issues as to their validity, the problem might be even more acute with historical data. Contrary to Labov's claims, my hypothesis is that historical data is a valuable source of socio-pragmatic and historical information. I will demonstrate below how my hypothesis is borne out by data from various types of legal texts (courtroom records, depositions, and wills). I have selected the three genres since they have been shown to represent a varied degree of orality, hence they should relatively adequately reflect the spoken idiom of the past, in this case the Early Modern English period. Moreover, the three genres represent the language of the law, thus they share a certain socio-pragmatic domain, with its special vocabulary and, above all, special patterns of socio-pragmatic behaviour. Let's examine some excerpts from the sources of interest here for the occurrence of two selected features of orality: turn-taking (and possibly the use of discourse markers) and speech acts.

## **3. Analysis**

### *3.1. Turn-taking and the use of discourse markers*

3.1.1. Courtroom records: *The Trial of Titus Oates* (henceforth *TO*) and *The Trial of Lady Alice Lisle* (henceforth *AL*), cf. *Hargrave* (1730)

In the courtroom proceedings the participants mainly used three discourse markers to mark new turns: *well*, *now*, *well then*, e.g.

- (1) *L.C.J.* Have you any other questions to ask her, Mr. Oates?  
*Oates.* No, my Lord, I have not. She was a witness before at *Whitebread's* Trial, and was not believed there.  
*L.C.J.* Well, make your Remarks by and by, and let them now go on with their Evidence. (*TO*)
- (2) *L.C.J.* Now, my Lord, we shall go to our Evidence to prove, that all this is absolutely false. For *Ireland* went out of Town into *Staffordshire*. (*TO*)
- (3) *L.C.J.* Who was that other person?  
*Mr. Carpenter.* I did ask his Name, but he said, he did not know him.  
*L.C.J.* Well then, when they came there on the *Tuesday night*, how did you receive them? (*AL*)

The quantitative data given in Table 1 below shows that, as can be expected, it was the interrogators who performed most of the turns and were in control of the discourse. The statistics refer to the entire text of the trial and include the usual interrogators like Lord Chief Justice, Attorney General and Solicitor General, as well as Titus Oates who, despite being the defendant, was allowed to defend himself due to his high social position (an Anglican priest with a doctoral degree):

<i>The interrogators:</i>			<i>The interrogated:</i>		
Lord Chief Justice	93	= 21.9 %	Mrs. Anne Ireland	26	= 6.1%
Titus Oates	67	= 15.8 %	Lord Aston	16	= 3.7%
Attorney General	60	= 14.1 %	Mrs. Duddle	15	= 3.5%
Solicitor General	35	= 8.2 %	Mrs. Graves	11	= 2.6%
			Mr. Richardson	10	= 2.3%
			Mrs Keeling	10	= 2.3%
			Mr Fowler	9	= 2.1%
			Mrs Fowler	9 <sup>i</sup>	= 2.1%

Table 1: The number of turns performed by the main participants of *The Trial of Titus Oates*

As can be seen in Table 2 below, a somewhat different situation held in the case of *The Trial of Lady Alice Lisle*, where like in *The Trial of Titus Oates*, the majority of turns were performed by one of the interrogators (Lord Chief Justice Jeffreys). However, it was not the prosecutor, Mr. Pollexfen, who was the second most active participant in the proceedings, but the chief witness Dunne (29% of the overall turns).

<i>The interrogators</i>			<i>The interrogated</i>		
Lord Chief Justice	137	= 48.5%	Dunne	82	= 29%
Mr. Pollexfen	6	= 2.1%	Mr. Carpenter	26	= 9.2%
			Lady Lisle	17	= 6.02%
			Mrs. Carpenter	14	= 4.9% <sup>ii</sup>

Table 2: The number of turns performed by the main participants of *The Trial of Lady Alice Lisle*

### 3.1.2. Depositions: *Edmund Robinson: Pendle, Lancashire 1634, cf. Cusack (1998: 138f)*

Even though depositions should be similar to courtroom records, it seems that the turns in depositions can be detected only indirectly from the accounts in reported speech (as put down by the scribes). However, notice the use of *videlicet*, a discourse marker introducing an amplification, more precise explanation, or specifying list, cf. Moore (2006: 246ff). Thus, depositions would be departing from the relatively authentic "good data" like courtroom records towards "worse data", where the interventions of the scribes are much more obvious, as in the following excerpt (notice also the beginning remarks).

- (4) The examination of Edward Robinson sonne of Edward Robinson of Pendle Forest Mason taken at Padian before Richard Shuttleworth and John Starkey Esquires two of his mates Justices of the peace within the county of Lancaster the 10th day of Februarie Anno domini 1633
- Who informeth vpon oath beinge examined touchinge the grete meetinge of the Witches of Pendle, saith: That upon All Saintes day last past, Hee this Informer beinge with one Henrie Parker a neere doore-neighbour to him in Wheatley, who desired the said Parker to give him leave to get some Bullas, which hee did, in which tyme of getting Bullas hee sawe two Grey houndes *videlicet* a blacke and a browne one come running over the next field towards him, Hee verilie thinketh

the one to bee M'Butters and the other to bee M'Robinsons, the said M'Butter and M'Robinson then haveinge such like.

Notice that although turn-taking is only marginally present in the examined deposition, another exponent of orality detected here is the occurrence of deictic expressions (time and place deixis, e.g. *All Saintes day last past*).

### 3.1.3. *Wills : The original will of Elisabeth Whipp, Midwife (1645-6), cf. Ostovich and Sauer (2004: 43-46)*

All the above-mentioned features of orality are even less traceable in wills, which, by definition, are narrations without any obvious characteristics of orality. The exception here is the closing formula, which is an example of formulaic language characteristic of wills only, i.e. the speech act of bequeathing to be discussed in the next section devoted to performatives. Notice also the use of *and* as a turn-taking device. Finally, it should be emphasized that due to their peculiar syntactic structure (a list of items to be bequeathed), wills provide us with invaluable socio-cultural information about the times when they were written.

(5) and my redd petticote with two gold laces Item I give to my daughter Siday A paire of Holland sheetes A fine childbed sheete a flaxen table cloth, a dozen of naptkins a payre of course sheetes A course table cloth a dozen of naptkins fower towels and my watered Tabbee gowne and my crimson satin petticote with small silver laces Item I give to my sonne George Whip...

...And soe revokeing & making voyd all former wills & bequests by me att any time heretofore made willed or given doe make & ordeyne their presentes to bee my last will & Testament & none other nor otherwise In witness whereof I the said Elizabeth Whipp have hereunto sett my hand & seale the day & yeare above written.

## 3.2. *Speech acts*

### 3.2.1. *Courtroom records*

Another crucial component of orality are speech acts. Assuming after Arnovick (1999) that diachronic speech act theory is possible, let's try to identify some illocutions

in the texts of the two trials. The task is not difficult, and this is for a few reasons. In the genre analysed here, i.e. courtroom records, the act of questioning (most often a request for information) is the main means of conducting trial proceedings. It is hardly disputable that the right to ask questions constitutes an important instrument of power in court, or as Culpeper and Kytö have put it: "Questioning is central to courtroom discourse, not only in terms of frequency, but also as a way of controlling the discourse", cf. Culpeper and Kytö (2000:62). Moreover, the formal language used by the interrogators creates social distance from the interrogated and enhances the power which the former have over the latter. Finally, since the use of performatives and formulaic expressions clearly contributes to the fragmentation, spontaneity and directness of the ongoing discourse, the occurrence of these features provides additional evidence concerning the orality of my data, cf. Ong (1982). Even a short glimpse at the texts of the two trials reveals a few instances of speech acts. Some of the performative formulae employed in the Early Modern English period do not differ from those used in the modern legal jargon to mark new turns, e.g. *Swear X* or *ask*, cf. (6) and (7), respectively. However, some other expressions are now marked as archaic, to mention only the obsolete use of the verb *desire* in *I desire to know*, cf. (8):

- (6) *Mr. At. Gen. Pray swear Mrs.Duddle, and Mrs. Quino.  
Which was done. (TO)*
- (7) *L. C. J. My Lord, I ask you this Question; you say, you have a general  
Apprehension,  
that he did go with you to Tixhall. (TO)*
- (8) *Oates. Pray, my Lord, I desire to know what Religion he is of. (TO)*

Performative utterances were among the linguistic means used as instruments of power in the Early Modern English legal system. Language could be subject of conscious manipulation by the interrogators especially when they exercised their authority in order to elicit information and to achieve their ultimate goal, e.g. making the defendant plead guilty. A pertinent example of such a usage of performatives is (9), where the verbal behaviour of the infamous Judge Jeffreys perfectly agrees with his reputation. He uses his position of power to humiliate the defendant, Lady Alice Lisle, in order to make her plead guilty by means of the (pragmatically very effective)

escalation of his verbal actions from expressing pity through prayer to begging in the name of the defendant's welfare:

- (9) *L.C.J.* I pity thee with all my Soul, and pray to God Almighty for thee to forgive thee, and to the blessed Jesus to mediate for thee; and I pray for thee with as much earnestness, as I would for my own Soul; and I beg of thee once more, as thou regardest thy own eternal Welfare, to tell all the Truth (*AL*)

In some cases the interrogator's position of power could become even more prominent. When he was getting impatient or angry in the course of the interrogation process, he would try to force his interlocutor to confess. (10) is an excellent example of an exchange, where Lord Chief Justice Jeffreys is questioning Dunne, the chief witness in the trial. Since Dunne was particularly uncooperative and recalcitrant, the judge tries to corner the witness by employing utterances of increasing directness and a careful fragmentation of the discourse. Thus he starts with a speech act of polite invitation/request (*come*), then passes on to an indirect request (*let me ask you...*), and through a direct request preceded by *prithoe* (normally used as a politeness marker), he culminates his plea with *prithoe* followed by an order. It must be added that apart from fragmentation and directness, the excerpt below bears another feature of orality, i.e. spontaneity, traceable especially in the speech of the obviously infuriated Lord Chief Justice, e.g. in the frequent repetitions (*come*), or a somewhat ironic use of *prithoe* combined with an order in the last sentence:

- (10) *L. C. J.* Was there nothing of coming from beyond Seas, who came from thence, and how they came? Come, I would have it rather the Effect of thy own Ingenuity, than lead thee by any Questions that I can propound; come, tell us what was the Discourse.  
*Dunne.* I do not remember all the Discourse.  
*L. C. J.* Prithee, let me ask thee one Question, and answer me it fairly; Did'st not thou hear *Nelthorp's* Name named in the Room?  
*Dunne.* My Lord, I cannot tell whether he were called *Nelthorp*, but it was either *Crofts* or # *Nelthorp*, I am sure one of them.  
*L. C. J.* Prithee be ingenuous, and let's have the Truth on't? (*AL*)

Finally, another property of the discourse in (10) is of importance for the present analysis. The Lord Chief Justice's appeal to the witness' ingenuity takes the discourse

outside its canonical frame of the utterance and transforms the appeal into what call elsewhere a *legal meta-comment*, cf. Kryk-Kastovsky (2002: 248ff). Such a meta-comment can be considered another instantiation of orality mentioned in Ong (1982), i.e. the closeness of the discourse to the socio-cultural context. In view of the above, it can be concluded that courtroom records are examples of very good data, reflecting the idiom of the past and supplying an abundance of valuable socio-historical information.

3.2.2. *Depositions: The deposition of Margaret Christmas "Suttill contra Suttill", Canterbury Consistory Court Deposition Book (1589-92), cf. Ostovich and Sauer (2004: 19-23)*

As can be expected, depositions do not employ performative formulae. The only obvious exponents of orality are deictic expressions indicating the spatio-temporal location of persons and events. Frequently, the points in time were not marked by dates but by descriptions of events that happened parallelly, e.g. "the great wind". Notice also the reference to persons and places by means of the expression *the said*.

(11) Ad xiii articulum dicit that a week or fortnighte after the great winde last past aliter diem aut tempus non recolit ut dicit she this deponent being servant to the articulate Alice Suttill was commanded by her to go & seke in a vawte of the said howse wher wood lye for a pece of paper written & this depondentsoughte and finde a pece of paper ...

3.2.3. *Wills: The original will of Elisabeth Whipp, Midwife (1645-6), cf. Ostovich and Sauer (2004: 43-46)*

As mentioned before, at least one performative formula occurs (and is in fact obligatory) in wills. Consider the following excerpt from *The original will of Elisabeth Whipp, Midwife (1645-6)*. As was the case in (5) above, the actual will is an enumeration of items and the persons to which they should go. Since this is irrelevant for a speech act analysis, I will quote only a few lines of the will and concentrate on the closing formula. The formula starts with *And* which makes it performative, hence contributes to the orality and/or authenticity of the document. It is worth noting at this point that the performativity of the (closing formula) of wills has been noticed before by e.g. Danet and Bogoch (1994), de Lungo Camiciotti (2002).

- (12) ...And soe revokeing & making voyd all former wills & bequests by me att any time heretofore made willed or given doe make & ordeyne their presentes to bee my last will & Testament & none other nor otherwise In witness whereof I the said Elizabeth Whipp have hereunto sett my hand & seale the day & yeare above written.

Sealed published declared & delivered by the said Elizabeth Whipp As & for her last will & Testament the day of the date hereof in the presence of

The marke of Alice Dugdale and Ellen Linton

Henry Arnold Scrivener

The marke of the said Elizabeth Whipp (Mark where she placed her seal)

Parish of St. Ethelburga

This will was probated 26 February 1645 in the presence of Robert Wyseman, Doctor of Laws, surrogate, by Hester Whipp, executrix, under oath.

#### **4. Conclusion**

To conclude, I hope to have shown on the example of the three genres from the Early Modern English period, i.e. courtroom records, depositions and wills, that the question asked in my title "How bad is bad data" can be answered "Not too bad", provided that data with an appropriate amount of orality is selected. Then it provides not only linguistic information about the discourse of the past, but additionally introduces us into the world of the Early Modern English society and provides rich historical and socio-cultural information.

## The 3<sup>rd</sup> Person Singular Exception in Slavic

Boštjan Dvořák

ZAS Berlin

[dvorak@zas.gwz-berlin.de](mailto:dvorak@zas.gwz-berlin.de)

In many Slavic languages, the 3<sup>rd</sup> person Sg represents an exception with regard to the sequence of object clitics and auxiliaries (1); the deviation from the otherwise canonical order of Auxiliary + Clitic (a) to Clitic + Auxiliary (b) is obligatory, it appears automatically and can lead to interesting syntactic and phonological effects, as shown in (1’);

(1) Slovenian:

- a) 1.P. *Videl sem ga.*  
ppa m aux1 cl. Him  
‘I have seen him.’
- b) 3.P. *Videl ga je.*  
ppa m cl. him aux3  
‘He has seen him.’

(1’)

- a) 1.P. *Videl sem GA.*  
ppa m aux1 cl. Him  
‘I DID see him.’
- b) 3.P. *Videl ga JE.*  
ppa m cl. him aux3  
‘He DID see him.’

Although this positional irregularity is acquired as a self-evident property within the paradigms and references to its existence may be found somewhere, there is still no corresponding explanation available in relation to its origin, nor can we point to a specially significant linguistic interest in this respect. Three recent approaches will be presented and discussed within the scope of this consideration, aiming to explain the exceptional position of the 3<sup>rd</sup> Person Sg within the paradigmatic system in Slavic, mainly based on historical material found in several Slavic languages; whereas Bošković refers to its phonological nature, Phomola tries to derive its origin from a reconstructed stage of morphological underspecification in older Eastern and Church Slavic, referring additionally to archaic constructions of some West Slavic dialects, and Migdalski associates it with the third person auxiliary as a number marker on the base of a syntactically motivated change with evidence from Polish and South Slavic. However, the 3<sup>rd</sup> Person Singular exception does not seem to be an isolated phenomenon in Slavic, in general; in many other languages and language families, the 3<sup>rd</sup> Person (Sg) is more likely to be associated with quite numerous irregularities, when compared to the rest of the paradigms (Dvořák) – a fact leading to the speculation that it often represents an older stage of conjugation, eventually based on the connection of what could be considered as the very origin of the inflectional categories at the interface of the nominal and verbal systems (Haudry). The discussion will also apply to concomitant phenomena of the 3<sup>rd</sup> person-irregularity in several Slavic languages, including the reflexive and other copulaless constructions.

# **Language history meets typology: Relevance-driven Change in German Verbs**

**Damaris Nübling**  
**Antje Dammel**

University of Mainz, Germany  
Johannes Gutenberg Universität  
FB 05, Deutsches Institut  
55099 Mainz  
Germany  
[nuebling@uni-mainz.de](mailto:nuebling@uni-mainz.de)  
[dammel@uni-mainz.de](mailto:dammel@uni-mainz.de)

This article discusses morphological changes undergone by German verbs over the course of the language's history and demonstrates that Bybee's (1985, 1994) relevance principle, which was originally established for synchronic purposes, may be applied to diachronic data as well. It will be shown that after many centuries of only phonological changes, dramatic morphological changes took place in the Early New High German period, starting with the formal weakening of the less relevant verbal categories (person and number) and ending with the strengthening of the most relevant ones (mood and tense). Strengthening the tense category can be considered the most important process through the history of grammatical change in German in contrast to other Germanic languages. Thus, there is a strong interdependency between language history and language typology in the sense of a "dynamicization of typology" (Croft 1990: 203ff).

## **1 Determinants of Inflectional Expression: Relevance and Generality**

Bybee (1985) investigated a sample of 50 typologically different languages that were neither genetically nor geographically related. In her attempt to find out how these languages expressed grammatical meaning, focused on verbal categories. The most common verbal categories in the languages of the world are person, number, mood, tense, aspect, voice, and valence. We will concentrate on the four different inflectional

categories found in German: person, number, mood, and tense. Aspect is expressed periphrastically, not through verbal inflections. The order of the different affixes is governed by two semantic principles, relevance and generality:

A meaning element is **relevant** to another meaning element **if the semantic content of the first directly affects or modifies the semantic content of the second**. If two meaning elements are, by their content, highly relevant to one another, then it is predicted that they may have lexical or inflectional expression, but if they are irrelevant to one another, then their combination will be restricted to syntactic expression.” (Bybee 1985: 13)

Number and person are less relevant to the verbal action than other categories, as they only refer to the agent(s) and not the action itself. Furthermore, both categories are usually expressed through the nominal or pronominal subject of the sentence. Therefore, Bybee calls them “agreement categories” (Bybee 1985: 28). In contrast, tense and aspect refer to the temporal structure of the action, either externally (tense) or internally (aspect). They are highly relevant to the lexical stem and are therefore usually expressed closer to the stem than the other two categories. The following quotation emphasizes diagrammatic iconism, which refers to a correlation between meaning and form, i.e. the closer in meaning two categories are, the closer to each other the forms expressing them will be: “The degree of relevance predicts the likelihood of lexical or derivational expression of the grammatical category, the order of affixes with respect to the stem, and the degree of morphophonological fusion between the gram and the stem” (Bybee et al. 1994, S. 22). Before we turn to the different types of expression, we will present the second principle, generality:

The second factor that needs to be taken into consideration in determining what can be an inflectional category is *lexical generality*. By definition, an inflectional category must be applicable to all stems of the appropriate semantic and syntactic category and must obligatorily occur in the appropriate syntactic context. In order for a morphological process to be so general, it must have only minimal semantic content. If a semantic element has high content, i.e. is very specific, it simply will not be applicable to a large number of stems“ (Bybee 1985: 16/17)

Person and number express minimal semantic information; they only provide information about the number of agents and whether the agent is the speaker, the hearer,

is so relevant that it is mostly expressed derivationally in German using special prefixes (which include many allomorphs) such as *er-*, *ver-*, *ein-* and *aus-*, e.g. *blühen* 'to bloom, to be in flower', *erblühen* 'to start blooming', *verblühen* 'to wither'. The main difference between derivation and inflection is the degree of obligatoriness of the category and predictability of the meaning of the whole word based on its parts. Both criteria are less valid in the case of derivation. Other ways to express aspect in German are periphrastic constructions (which belong to the “free grammatical” category) such as *anfangen*, *etwas zu tun* 'to start doing sth.', *dabei sein*, *etwas zu tun*, 'to be doing sth.', *aufhören*, *etwas zu tun* 'to stop doing sth.'. Whereas Bybee primarily considers the degree of fusion (located on the syntagmatic level), allomorphy (located on the paradigmatic level) seems to be linked with relevance as well.

## 2.2 Token frequency

We will now turn to the last factor that influences the relation between meaning and form: the role of token or text frequency. There are two types of token frequency. One is lexical frequency, which is the frequency of a stem expressing the lexical meaning, such as *geb-* 'give' in NHG. *geben* 'to give' which is the twelfth most frequently used verb (including auxiliaries and modals). A similar idea can be expressed by *überreichen* 'to hand over', whose lexical frequency is very low. The other is category frequency, which is the frequency of a grammatical category. It is self-evident that the present tense is used more frequently than the past tense or even the future tense. Since high token frequency usually correlates with short forms, zero expression is typically found in present tense forms. Although they are completely unrelated, both types of high token frequency have the same effect as high relevance: a higher degree of morphophonological fusion (with suppletion as an extreme) and to shorter forms. This impact is best seen by considering the past tense forms of two superficially similar verbs, NHG. *beben* 'to tremble, quake' and *geben* 'to give', *beben* being rather infrequent compared to *geben*. It is no accident that *beben* belongs to the (generally less frequently occurring) weak verbs that add a special preterite suffix to the stem, whereas *geben* belongs to the strong verbs that form their preterite through a stem vowel change (ablaut), see Figure 3.

Figure 3: The different preterites of NHG *beben* 'tremble' and *geben* 'give'

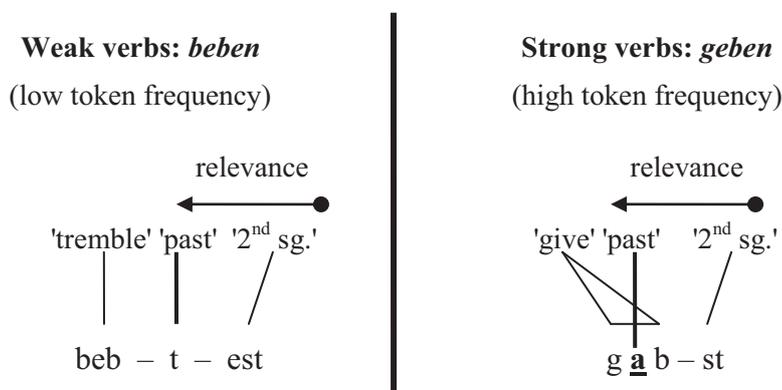

Figure 3 shows that the past tense morpheme, which has the same (high) degree of relevance in both verbs, is realized as a separate suffix in the case of the less frequently occurring *beben* 'tremble', whereas the same morpheme is completely integrated into the stem in the case of *geben* 'to give'. As a direct consequence, the preterite of *geben* is shorter than that of *beben*: the former is *gab* (one syllable) and the latter is *bebte* (two syllables). This is a consistent difference between strong and weak verbs. In contrast, the less relevant person/number information follows the tense information as a suffix in both cases. Interestingly, only in the case of weak verbs does *-(e)st* '2<sup>nd</sup> sg.' have to be realized as a syllabic allomorph, *-est*, after [t] (*macht-est* 'you made'); this is not obligatory in the case of strong verbs ending in [t], where a non-syllabic *-st* may follow, c.f. *riet-st* '(you) guessed' and *riet-est* (from *rat-en*, strong verb). This option does not exist for weak verbs (*\*macht-st*).

### 3 German Language History: The Weakening of Less Relevant Categories and the Strengthening of More Relevant Ones

In order to understand the dramatic morphological changes that have occurred since the Early New High German (ENHG) period (1350-1650), it is important to know that for many centuries German language change consisted solely of phonological changes that disturbed, disordered and even destroyed morphology. In the Old High German (OHG) and Middle High German (MHG) periods, extending from the eighth to the fourteenth century, the most important changes were phonological in nature and they were quite often reductive. Only three of them will be mentioned here:

a) fronting (i-umlaut): every velar vowel was fronted when followed by a syllable containing [i(:)] or [j], e.g. OHG (*du*) *bund-i* 'you (2<sup>nd</sup> sg.) bound' > (*du*) *bünd-i* > MHG/ENHG *bünd-e*. This phonological rule led to the integration of 2<sup>nd</sup> sg. markers into the stem. At the end of the MHG period, number and person information were integrated into the stem, leading to an inappropriate position according to Bybee's principles.

b) reduction and even loss of unstressed vowels (syncope, apocope): in many cases this reductive sound law led to the loss of morphological information.

c) Due to many assimilations, the rather regular ablaut system of strong verbs lost its transparency and became opaque. An example is the OHG verb *queman* 'to come', which belonged to the fourth ablaut class and underwent a singular assimilation: the *e* was rounded to *o* due to a preceding [w] which later disappeared: *q[w]eman* > \**q[w]oman* > *koman* > NHG *kommen*. This exceptional assimilation produced a unique ablaut pattern that isolated this verb from the former system of seven ablaut classes. So far, no analogical levelling has taken place. Such singular developments occurred with many strong verbs.

### 3.1 Weakening of Person and Number

Centuries of phonological change had a destructive effect on morphology. Not until the beginning of the ENHG period did morphological restructurings and improvements begin. These are displayed in Figure 4, which provides an overview of the most important verbal changes in the history of German. To some extent, it is like a chain reaction going from right to left.

Please insert Figure 4: Overview of the relevance-driven weakening and strengthening of verbal categories in German

For lack of space, we will only discuss three categories: person, number, and tense. For the development of mood and aspect, see Nübling/Dammel (2004). What is most important is the fact that this process of relevance-driven reordering starts with the least relevant category, person. The 2<sup>nd</sup> sg. category even affected the stem vowel of the lexematic root due to umlaut, as in MHD *bünde* '(you) bound', which was shown above. On the one hand, this category formally behaved like an extremely relevant one; on the other hand, it could be expressed through three different, morphologically conditioned allomorphs depending on inflection class (Table 1).

Table 1: Weakening of person by reducing allomorphy: 2<sup>nd</sup> person singular

	2 <sup>nd</sup> person singular		
inflection class/ category	strong verbs/ past tense	preterite present verbs present tense	elsewhere
MHG allomorphs	{ <b>ablaut in pl., umlaut + -e</b> } <i>(du) b<u>ü</u>nd<u>e</u></i>	{ <b>-t</b> } <i>(du) wil<u>t</u></i>	{ <b>-st</b> } <i>(du) gib<u>st</u></i>
NHG morpheme (uniform)	{ <b>-st</b> } <i>du band(e)<u>st</u>, will<u>st</u>, gib<u>st</u></i>		

In NHG, only *-st* remains, as can be seen in the last row of Table 1, and stem vowel changes have been abolished. Thus, allomorphy was replaced by a uniform suffix following the stem and, in the case of weak verbs, the preterite marker *-t-*: *(du) mach-est* '(you) made'.

As a consequence of the change from MHG *bünde* > ENHG *band(e)st*, strong verbs acquired an unchanging singular stem in the preterite, and this can be interpreted as an (automatic) strengthening of number because it led to a clear-cut opposition, of number ablaut as can be seen in Table 2.

Please insert Table 2

Table 2: The Upgrading and Downgrading of Number in ENHG

past		MHG (11 <sup>th</sup> -13 <sup>th</sup> cent.)	ENHG (14 <sup>th</sup> -17 <sup>th</sup> cent.)	NHG (18 <sup>th</sup> cent.-today)
Sg.	1.	<i><b>bant</b></i>	<i><b>band</b></i>	<i><b>band</b></i>
	2.	<i>b<u>ü</u>nd-<u>e</u></i>	<i><b>band-(e)st</b></i>	<i><b>band-(e)st</b></i>
	3.	<i><b>bant</b></i>	<i><b>band</b></i>	<i><b>band</b></i>
Pl.	1.	<i>bund-en</i>	<i>bund-en</i>	<i><b>band-en</b></i>
	2.	<i>bund-et</i>	<i>bund-et</i>	<i><b>band-et</b></i>
	3.	<i>bund-en</i>	<i>bund-en</i>	<i><b>band-en</b></i>
		no clear system (plural relatively homogenous)	weakening of person > strengthening of number (clear number ablaut): <i>b<u>ü</u>nd</i> vs. <i>b<u>u</u>nden</i>	weakening of number (levelling) > strengthening of tense: <i>b<u>ü</u>nden</i> vs. <i>b<u>u</u>nd</i> vs. <i>geb<u>u</u>nden</i>

This ENHG number opposition was, however, soon eliminated by the number levelling that occurred in the preterite forms of the strong verbs. This was a far-reaching and very important morphological change that marks the boundary between ENHG and NHG (Solms 1984, Chrita 1988, Nübling 1999). In the case of the (third) ablaut class of *binden* 'bind', it was the 2<sup>nd</sup> ablaut stage (used for the singular) that was generalized - in the case of other ablaut classes, it was the 3<sup>rd</sup> ablaut stage (used for the plural). In every case, ablaut thus became a mono-functional marker of tense (c.f. Wurzel 1994). This restriction of ablaut stem alternation to tense alone led to an indirect strengthening, or upgrading, of this category.

### *3.2 Strengthening of Tense*

Thus, there are at least three ways of strengthening tense that have already been mentioned and will be summarized here:

(1) number levelling in the preterite forms of the strong verbs, as indicated in Figure 4 by the arrow starting at number and ending at tense; this upgrading of tense resulted from a downgrading of number and is therefore part of the above mentioned chain reaction. Tense was concentrated in the root of the verb, whereas number and person were moved from the root to the periphery: they were realized before the root as obligatory subject pronouns, and behind it as person/number endings.

(2) mono-functionalization of a tense marker: Since ablaut was no longer used as a number marker, it developed into a mono-functional tense marker. The use of an exclusive marker, which is furthermore closely integrated into the lexical stem, has to be considered a strengthening of the category affected, which is tense;

(3) the splitting up of the ablaut classes from only seven in OHG to more than 40 in NHG (Augst 1975, Hempen 1988). Interestingly, in most cases, it was phonological change that led to a dramatic increase in allomorphy. This huge amount of allomorphy was tolerated or even used by not being levelled out morphologically. This process is independent from other morphological developments and therefore indicated by the long arrow at the bottom to the word "Tense" in Figure 4. We consider allomorphy to be an indicator of high relevance (see Figure 2) because the same information can be expressed through different affixes. Thus, high relevance correlates with at least two formal phenomena: on the syntagmatic level, with closeness and even fusion of (at least) two semantic units, and on the paradigmatic level with allomorphy. It is no coincidence that it was the tense category that was strengthened this way and that it is the most frequently used strong verb class affected by this process. As can be seen in

Figure 3, the less frequently used weak verbs do not show this degree of fusion and allomorphy. Thus, token frequency is a very influential factor in explaining morphology. Interestingly, the aspect category has not survived as an inflectional category, and this distinguishes German from the other Germanic languages (see Nübling/Dammel 2004: 198/199). Finally, mood is a rather relevant category which has been strengthened (in the case of strong verbs) as well as weakened (in the case of weak verbs) in German language history. Further details can be found in Nübling/Dammel (2004).

#### **4 Summary**

The diachronic development of German verb inflection strongly confirms the validity of the morphological parameters described by Bybee (1985, 1994) and Bybee et al. (1994) for typological purposes: relevance, generality, token frequency and their correlation with special types of expression. Structures that are most widespread typologically are reconstructed and restored if phonological change has had a destructive influence on morphology. This was the situation at the beginning of the fourteenth century in German. It has been shown that chronologically, the process of “repair” started with the least relevant category and ended with the most relevant one. Furthermore, it was shown that there is a complex interdependency between these processes: The weakening of one category can indirectly lead to the strengthening of another.

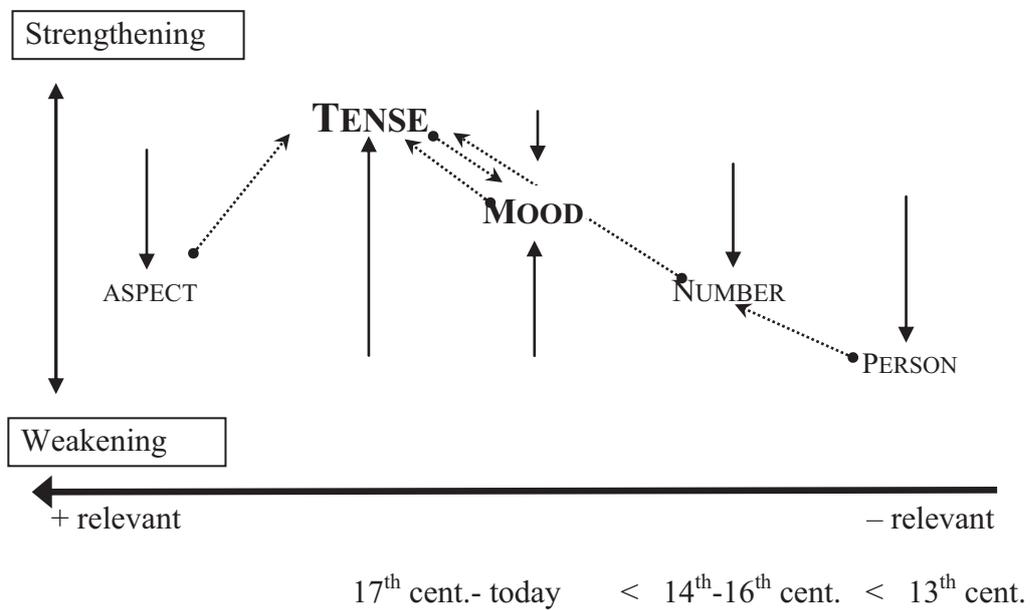

Of course, it is obvious that synchronic structures must have arisen historically. Such cases (as for example the dental suffixes of weak verbs) are often discussed from a grammaticalization perspective: it is shown that syntactic units are ordered according to relevance considerations even before they are morphologized (c.f. the position of subjects and objects near the verb). In contrast, the aim of this paper was to show that pre-existing morphological information can be reordered according to typologically principles related to the frequency of different structures, and how that happens.

# English word-formation, combining forms and neo-classical compounds: a reassessment<sup>1</sup>

Dieter Kastovsky

Institut für Anglistik und Amerikanistik, Universität Wien  
Universitätscampus AAKH, Spitalgasse 2-4, Hof 8, A-1090 Vienna, Austria

## Abstract

The constituents of formations such as *astr-o-naut*, *agr-i-culture*, *galvan-o-scope*, *phon-o-logy* etc. have been termed "combining forms" and "terminal elements" in the *OED*. However, the *OED* did not provide any criteria on the basis of which these elements could be distinguished from affixes, stems or clipped lexical items. Consequently, the notion of "combining forms" remained diffuse and controversial. In the present paper it will be suggested that this "category" is not really needed, and that a cline of increasing boundness (dependence) with genuine word-based compounding, stem-compounding, affixation, clip-compounding and blending as prototypical processes, needed outside the combining form domain, is sufficient to account for these formations. This is based on the assumption that English word-formation not only involves word-based but also stem-based processes.

**Keywords:** affixation, blending, clipping, clip-compound, combining form, compounding, lexeme, linking vowel, stem, stem formative, terminal element, word form, word

## 1. Introduction

It is estimated that about 70 % of the English vocabulary as recorded in the *Oxford English Dictionary (OED)* are loans, the lion's share coming from French, Latin and Greek and what has been called Neo-Latin, i.e. the variety of Latin used as *lingua franca* in the Middle Ages and the Renaissance, which was a mixture of Latin and Greek vocabulary. This massive borrowing has resulted in the incorporation of non-native word-formation patterns into English. Of the 66 prefixes listed in Marchand (1969), 56 are of non-native origin, and of the 81 suffixes, 48 are foreign, i.e. both prefixation and suffixation is more foreign than native. These patterns have been assimilated – i.e. nativised – to various degrees, which has resulted in a heterogeneous morphological system (cf., e.g., Marchand 1969: 5-8, 131-134, 215-220; Kastovsky 1994) with fuzzy edges between native, nativised and non-native patterns. Thus, e. g. the loan suffix *-able* operates at the native level in forms such as (1 a) without morphophonemic alternation, but at a non-native level with stress shift and morphophonemic alternation in (1 b):

- (1) a. *lovable*, *desirable*, *ad'mirable* /æd'maɪrəbl/ (< *ad'mire*), *navigatable* (< *navigate*)  
b. *'admirable* /'ædmɪrəbl/, *navigable* (< *navig(ate)*)

---

<sup>1</sup> I would like to thank Hans-Jürgen Diller and the participants in the Historical Section for helpful comments, and Corinna Weiss also for her help with some of the sources.

A neat, categorical separation of these morphological levels as is proposed in some varieties of lexical phonology is therefore rather problematic, cf. also e.g. Dalton-Puffer (2002).

A similar demarcation problem, also connected with the borrowing of non-native word-formation patterns, arises with formations such as those in (2):

- (2) a. *astr-o-naut, cosm-o-naut, Mars-naut, astr-o-physics, astr-o-bio (expert), bio-sphere, noo-sphere, agr-o-chemical, agr-i-culture, patr-i-cide, galvan-o-scope, Amer-i-phile*;  
b. *hyper-active, hyper-super-fast, hyper-aemia, omn-i-'present, omn-'i-scient, super-natural, extra-ordinary, ex-o-centric, mult-i-parous, pol-i-geny*;  
c. *diamond-i-ferous, hepat-itis, wakeup-itis, Winston-Churchill-itis, slug-fest, tech-talk-fest, astr-o-logy, phon-o-logy, ex-o-bio-logy, poly-logue, megal-o-mania, star-mania, scribble-mania*.

These are partly established lexical items listed in dictionaries, and partly neologisms collected primarily from science fiction novels, the latter illustrating the productivity of the processes involved, and also demonstrating that not only Neo-Latin elements are involved, cf. *slug-fest, talk-fest*.

It is such formations that will be the subject of this paper. Their constituents have been called "combining forms" and "terminal elements" by the *OED*, but the status of such formations and their constituents is far from clear and has been the subject of extensive controversy. In (2 a), the formations overlap with compounding, in (2 b) with prefixation, and in (2 c) with suffixation, and attempts to find criteria for a delimitation of combinations containing combining forms and these other word-formation processes (cf., e.g., most recently Prčić 2005, 2007, 2008) have so far not been very successful.<sup>2</sup>

The terms "combining form" and "terminal element" apparently go back to the *OED*, or, rather, the *New English Dictionary (NED)*, as it was originally called, and have been adopted by many scholars dealing with English word-formation as a viable descriptive device. Any criticism of these categories should of course bear in mind that they were proposed when morphological theory was in its infancy. Thus, although notions such as prefix, suffix, stem were used in the *NED*, there were no really precise definitions of these morphological categories beyond that of classical Neogrammarian philology, the then current theoretical framework, which had a profoundly historical bias (cf. Kastovsky 2000). The constituents of formations like those illustrated in (2) did not really fit these traditional categories, which is why the fathers of the *NED* invented the – unfortunately undefined – categories of "combining forms" and "terminal elements", without providing a systematic delimitation from notions such as "word", "stem", "prefix" or "suffix". After more than a century of research in derivational morphology it might therefore be high time to re-assess the usefulness of these categories and either come up with a more precise definition and delimitation of them, or decide to discard them as unsatisfactory red herrings. It is the latter stance that will be taken in the following.

---

<sup>2</sup> For a more detailed review of Prčić's approach, cf. Kastovsky (in press b).

## 2. Problems with combining forms

2.1. The most serious problem with these foreign elements termed "combining forms" or "terminal elements" is their delimitation from any of the other types of constituents such as stem or affix, which in the *OED* was rather unsystematic and arbitrary, cf. the following quotations from the *OED* (1989 edition; emphasis D.K.):

- (3) *Astro*-[...] repr. Gr. *ἀστρο-* **stem and comb. form** of *ἀστρον* 'star'...  
*Bio*- [...] repr. Gr. *βίο-* **stem and comb. form** of *βίος* 'life, course or way of living'...  
*Neo-* **combining form** of Gr. *νίος*, new [...] common in recent use as a **prefix** to ads. and sbs.  
*Micro-* [...], before a vowel *micr-*, repr. Gr. *μικρο-*, **combining form** of *μικρός* small, used chiefly in scientific terms.

Obviously, there was no systematic principle behind the classification of such elements as combining forms or affixes, cf. the dual affiliation assignments with *astro-*, *bio-*, and *neo-*. This is corroborated by a comparison with the classical handbook on English word-formation by Marchand (1969), which attempts a more rigorous definition of categories such as word, affix, etc. There, neither *astro-* nor *bio-* show up, whereas *micro-* and *neo-* do, but are listed as prefixes. Nevertheless, all four of them are regarded as "combining forms" by the *OED*, and would thus seem to have equal status, except that *neo-* is "common in recent use as a prefix", i.e. is classified both as a combining form and as a prefix. We may therefore want to ask: "what is it – a combining form or a prefix, or are prefixes identical with combining forms and vice versa?" This indeterminacy is of course not really surprising when one realises that the original *NED* edition did not contain any definition of "combining form" and also did not list it as a lexical entry. It is only in the 2nd edition of 1989 that we find a lexical entry for "combining form" with an appropriate quotation, cf.

In Latin and other languages, many words have a special combining form which appears only in compounds (or only in compounds and derivatives). [...] The foreign-learned part of the English vocabulary also shows a number of special combining forms; cf. *electro-*, combining form of *electric*, in such compounds as *electromagnet*. (*OED*, 2nd ed.1989, CD-Rom version 2004, s.v. *combining*, vbl.n.)

It is a noteworthy curiosity that the quotation is from Bloch & Trager (1942), a popular introduction to linguistics at the time, which apparently captures the practical *OED* use of the term, but does not provide specific criteria for delimitation and identification either, but at least attempts a definition of the term. Since the *OED* usually provides the earliest quotation of the respective entry, it should have quoted itself.

In the *Shorter Oxford English Dictionary* (Brown 1993), we find the following entry, but also without any more specific criteria for delimitation and identification: "a form of a word used (only) in compounds, as *Indo-* repr. *Indian* in *Indo-European*" (*Shorter Oxford English Dictionary*, s.v. *combining*, Comb. *combining form*).

2.2. It is not surprising, therefore, that Marchand in his handbook (Marchand (1969) criticised the relatively unsystematic practice of the *OED* as exemplified in (3); but, unfortunately, he was far from consistent either, as the following examples show. Thus, with regard to morphemes such as *ante-*, *extra-*, *intra-*, *meta-*, *para-*, etc., he says:

The patterns of coining are Neo-Latin (though some of the types are already Old Greek or Ancient Latin). With these **particles** [my emphasis] there is a practical difficulty. They may represent 1) such elements as are prefixes [...] in Latin or Greek, as **a-** (*acaudal*, etc.), **semi-** (*semi-annual*), 2) such elements as exist as prepositions or particles with an independent word existence, as **intra**, **circum** / **hyper**, **para**, 3) such as are stems of full words in Latin or Greek, as **multi-**, **omni-** / **astro-**, **hydro-**. This last group is usually termed 'combining forms' (OED, Webster). In principle the three groups are on the same footing from the point of view of English word-formation, as they represent loan elements in English with no independent existence as words. That **macro-**, **micro-**, and others should be termed combining forms while **hyper-**, **hypo-**, **intro-**, **intra-** and others are called prefixes by the OED, is by no means justified

Only such particles as are prefixed to full English words of general, learned, scientific or technical character can be termed prefixes. [...] We cannot, however, undertake to deal with all the prepositive elements occurring in English. Such elements as **astro-**, **electro-**, **galato-**, **hepato-**, **oscheo-**, and countless others which are used in scientific or technical terminology have not been treated in this book. They are of a purely dictionary interest in any case. In the main, only those particles have been considered that fall under the above groups 1) and 2). But we have also included a few prefixes which lie outside this scope, as prefixes denoting number (**poly-**, **multi-**), the pronominal stem **auto-** [...] and particles which are type-forming with English words of wider currency (as **crypto-**, **neo-**, **pseudo-**) (Marchand 1969: 131-132).

Thus, on the one hand he criticises the *OED* for treating elements like *a-*, *semi-* (= original prefixes) and *intra-*, *hyper-* (= original particles) as against *multi-*, *astro-* (= original stems) as different categories, viz. as affixes and combining forms. According to him, these should all have the same status in Modern English, viz. they should be treated as foreign bound forms. On the other hand, his "practical" solution is not consistent either. Thus, he regards as prefixes only such particles as are prefixed to "full English words" and excludes elements like *astro-*, *electro-*, *galato-* *hepato-*, *oscheo-*, etc. from treatment in his book because they are of a "purely dictionary interest" – a questionable argument in view of their frequency, at least in certain registers. But then he includes among the prefixes elements such as *poly-*, *multi-*, *auto-*, *crypto-*, *neo-*, originally either prefixes, stems or particles, all of which are subsumed under combining forms in the *OED*.

The same is true of Marchand's treatment of suffixes. Here the category of combining form again crops up, this time in the guise of the *OED*'s "terminal elements", which have either been "suffixes in Greek or Latin" or "such final elements as are really second-words of Latin respectively Neo-Latin compounds" (Marchand 1969: 218ff.).

Clearly, Marchand's main criterion is whether these elements – prefixes or suffixes – can "be prefixed [or suffixed, D.K.] to **full words** without, however, being

**independent words** themselves in English" (Marchand 1969: 132 [my emphasis]). It is this exclusively word-based analysis which creates the classification problem. This can be solved by accepting a non-native stem-based type of word-formation alongside the native word-based type, as will be shown in the next section.

The same problems, incidentally, also arise in Stein (1978), Bauer (1983), and Plag (2000), who recognise the problems involved in Marchand's treatment of these formations, but do not question the legitimacy of the category "combining form" and consequently cannot really provide a viable alternative.

Let me just mention that the distinction between combining forms and terminal elements has now been replaced by the distinction between "Initial combining forms" (ICF) and "Final combining forms" (FCF), introduced by Bauer (1983). Bauer himself in a later article (Bauer 1998), however, voices some doubts as to their status: although basically accepting the categories as such, he views them as having something in common with compounding on the one hand, and blends on the other, a position that I will extend below to a scale of free and dependent elements in word-formation, which makes the category of "combining form" superfluous.

2.3. The most recent attempt to come to terms with the category of "combining forms" is a series of papers by Prčić (2005, 2007, 2008), who has tried to establish criteria that supposedly allow a neat separation of combining forms and affixes. These are: (1) Category membership, (2) Distinctive form, (3) Co-occurrence restrictions, (4) Syntactic function, (5) Head-modifier relation, (6) Semantic meaning, (7) Morphosemantic patterning, (8) Productivity.

The net result of this attempt, however, is that Prčić has to admit that there is no hard and fast boundary between prefixes and ICFs, because these criteria always apply to a greater or lesser degree. Moreover, many of the criteria are problematic in themselves, for which cf. Kastovsky (in press b). Ultimately, the reason for this indeterminacy is the heterogeneous origin of the "combining forms", which go back to

- (4) a. Latin/Greek stems with and without stem-formatives or linking elements (as in *astr-o-naut*, *astr-o-logy*),
- b. curtailed stems (*Eur-asia*, *Eur-o-crat*),
- c. particles (*hyper-active*),
- d. affixes (*a-moral*).

### **3. The independent/dependent scale and morphological typology: a solution**

3.1. In view of these problems, and especially the heterogeneous source of the "combining forms", it is arguable that this category as a synchronic cover-term creates more problems than it solves. Instead, I will propose that notions such as compounding, affixation, clipping, and blending are sufficient to take care of these formations. These word-formation processes should be regarded as prototypical patterns arranged on a scale of progressively less independent constituents ranging from word via stem, affix, to curtailed words/stems to so-called splinters (cf. Lehrer 1998), i.e.

- (5) compounding (word) > stem compounding (stem) > affixation (word-/stem-based)  
> clipping compounds (clippings) > blending (splinters)

This scale interacts with the typological heterogeneity of the English word-formation system. I assume that one of the factors that characterise the typological status of a morphological system is the morphological status of the input to morphological processes, which need not necessarily be homogeneous (cf. e.g., Kastovsky 1992, 1994, 2006). In this respect, we can distinguish three types of input which represents a lexical item or "lexeme" as the starting point of inflectional and derivational processes.

3.2. The central notion in this framework is the "lexeme", which has now been adopted by many European morphologists instead of "word" as a cover term for more specific morphological representations, because of the ambivalence of the latter. Following Matthews (1974) and Lyons (1977), this can be defined as:

- (6) Lexeme: a simple or complex dictionary entry, i.e. an abstract entity as part of the lexicon of a language, e.g. *DO*, *DOER*, *UNDO*, *HELP*, *HELPER*, *HELPLESS*, *CHILD*, *CHILDLIKE*, *CHILDBED*, etc.

Lexemes can have three different types of basic representations, viz. "word", "stem", or "root". These can be defined as follows:

- (7) Word: an independent, meaningful syntactic element, susceptible of transposition in sentences, i.e. a "free form"; it may be simple or complex, uninflected or inflected, and is thus the concrete realisation of a word-form in an utterance, e.g. *do*, *does*, *did*, *do-er(-s)*, *undo*, *help*, *help-s*, *help-er(s-)*, *or*, *the*, etc.
- (8) Stem: a word-class specific lexeme representation which cannot on its own occur as a word but has to combine with additional derivational and/or inflectional morphemes to function as a word, i.e. a "bound form". It may itself contain derivational affixes or so-called stem-formatives, which determine the inflectional category, cf. G *bind<sub>V</sub>-*(*en*, *-e*, *-est*, etc.), OE *luf<sub>V</sub>-*(*ian*, *-ie*, *-ast*, *-od-e*, etc.), *luf<sub>V</sub>-estr<sub>N</sub>-*(*e*) 'female lover', Mod. E. *scient<sub>N</sub>-*(*ist*) vs. *science*, *dramat<sub>N</sub>-*(*ic*) vs. *drama*, Lat. *am-ā<sub>V</sub>-*(*re*), *hab-ē<sub>V</sub>-*(*re*), where *bind<sub>V</sub>-*, *luf<sub>V</sub>-*, *dramat<sub>N</sub>-*, *am-ā<sub>V</sub>-*, *hab-ē<sub>V</sub>-* are stems.
- (9) **Root**: an element that is left over when all derivational, stem-forming and inflectional elements are stripped away, and which needs morphological material to become a stem, to which further morphological material has to be added for the stem to become a word. Such roots can either be affiliated to a particular word-class, or they can be word-class neutral. In this case the word-class affiliation is added by a word-formative process, cf. IE roots like *\*gVn-* (the source of L *genus*, *gignere*, *cognatus*, E *kind*, *cognate*), *\*mVd-* 'measure' (cf. OE *metan*), *\*CVd-* 'eat' (cf. OE *etan*), *\*wVr-* 'turn' (cf. Lat *uer-t-ere*, *uer-m*, OE *weor-þ-an*, *wyr-m*, etc.), or Semitic *k.t.b.* 'write'.

On the basis of this, we can distinguish three basic types of morphology: word-based, stem-based and root-based. For the present purpose, only the first two are relevant. Root-based morphology seems to have been the characteristic feature of the Indo-European parent language, but was replaced by stem-based morphology in the various daughter languages.

Note that I use the terms "stem" and "root" in a specific way, which is geared to the history of the IE languages. Thus, as has just been stated, IE at some stage was root-based and needed morphological material to build stems – the so-called stem-formatives or other derivational material – to which then the actual inflectional nominal or verbal endings were added to form words. In the later stages of the IE languages, root-based morphology was superseded by stem-based morphology, since the stem-formatives were gradually lost as distinctive entities, merging with the roots or the inflectional endings. This resulted in a bound stem followed by an inflectional ending. This state of affairs characterises among others the older Germanic languages (cf. Kastovsky 1992, 1996, 2006). At this stage, the distinction between roots and stems lost its relevance, and morphology became stem-based. Eventually, thanks to the progressive loss of inflectional endings, these languages gradually develop also a word-based type of morphology. This dominates in Modern English inflection, whereas German is still a mixture of stem-based and word-based morphology (verbs are stem-based while nouns and adjectives are word-based).

Unfortunately, there is quite a bit of terminological confusion, since the terms "stem" and "root" are often used interchangeably or in a different sense than used here, cf. among others Bauer (1983: 20-21; 1992: 252-253), Giegerich (1999) or Huddleston and Pullum (2002: 1624-1625). A more detailed discussion of this terminological problem is not really relevant to the present topic and will therefore not be attempted. Suffice it to repeat that I will use the term "stem" as defined in (8) for what some linguists might prefer to call "root" also with reference to English or German, i.e. for a lexical element which is bound and which can only occur as a word with additional inflectional or derivational morphological material. The term "root" will be restricted to the Indo-European parent language and will not play any role in the following.

3.3. Looking at English from this point of view, Old English inflection was both stem- and word-based. But in Modern English, inflectional morphology is purely word-based (save for some foreign plurals such as *alumn-i*, *phenomen-a*, *apendic-es*, etc.). This is due to the drastic loss of inflection since OE, which led to the emergence of an unmarked base form. This form can be used as a word in the above definition (7) without any morphological material having to be added. This also holds for word-formation on a native basis of coining, both as regards compounding and affixation, cf. *book*, *bookish*, *booking*, *bookstore*, *rebook*. The influx of French and in particular Latin and Greek loans in late Middle English and Early Modern English reintroduced stem-based derivational morphology again, because both inflectional and derivational morphology in these languages had been primarily stem-based, and the imported patterns preserved this property, unless they became fully nativised. Thus, a level of non-native stem-based word-formation was introduced. No clear-cut boundary exists between these levels, as has been mentioned at the beginning, cf. (1). The input to such formations are actual or potential stems of corresponding lexical items in the source languages or their adaptations in English. If two such stems are combined we get stem-

compounds instead of word-compounds, cf. (2 a). If they combine with affixes, we get stem-based affixation (cf. 2 b, c). We thus simply have to acknowledge the fact that English word-formation is not exclusively based on "full words", but on words and stems, the latter operating at the non-native level. There is no reason, therefore, to exclude formations such as *astr-o-naut*, *mult-i-parous*, *pol-i-gey*, *part-i-cide*, *galvan-o-scope*, *socio-logy*, *hepat-itis*, etc., from a treatment of English word-formation because of their non-word-based foreign properties, as Marchand has postulated. Such formations have become increasingly frequent in Modern English and therefore deserve to be regarded as part of the English (though non-native) system.

3.4. The notion of stem as used here needs some additional clarification in the light of the original situation in Greek, Latin and Neo-Latin. As all Indo-European languages, Greek and Latin were originally based on a tri-partite structure, viz. root + stem-formative + inflection. In derivational morphology, including compounding, the root (or first element of a compound) was followed by a stem-formative, as in *agr-o-nomia*, but also, at least in compounding, could also be followed by a composition vowel which goes back to an inflectional ending, as in *agr-i-cultura* (cf. Kastovsky forthcoming b), since this type of formation resulted from lexicalised phrases involving case marking. But in the course of time, the stem formatives as well as the original inflectional endings became opaque, in Latin more so than in Greek, and these morphological elements can no longer be identified with any inflectional material but have to be re-interpreted as linking elements functioning in the same way as the German "Fugenelemente" in *Universität-s-bibliothek*, *Liebe-s-heirat*, *Kind-er-garten*, etc. They were imported in the same function into English, where they show up even with native material, cf. *kiss-o-gram*, *speed-o-meter*, *Kremlin-o-logy*. Their distribution and the mechanism that triggers them still need systematic investigation.

3.5. It has always been recognised that native prefixes and suffixes have developed from first- and second-members of compounds (cf. *fore-*, *out-*, *-dom*, *-hood*, *-monger*, *-wise*), which results in a synchronic cline between compound constituents, semi-affixes (sometimes called "affixoids") and genuine affixes, cf. Marchand's (1969) analysis of *-like*, *-monger*, *-wise* as semi-suffixes. But the same kind of development happened to first and second members of non-native stem-compounds, whatever their origin, e.g. *neo-*, *crypto-*, *multi-* or *-logy*, *-nomy*, *-itis*, resulting in the same kind of cline between compounding and affixation as with native word-formation. There is thus no need for undefined terms such as "combining forms" or "terminal elements", once we treat the notion of "stem" as defined above as part of English morphology. The real problem that is at issue here, and that has rarely been thematised, is the demarcation of compounding and affixation, where synchronically a strict dividing line does not seem to exist. Rather we have to assume a cline both with regard to formal (phonological and/or morphological) and semantic behaviour. For the latter, a more refined definition of "lexically specific" (for words and stems) and lexically non-specific (= general, abstract, etc. for affixes) would be necessary. But whether such a distinction is really viable in view of the fact that affixes can have very specific meanings, cf. *-age* 'fee' in *anchorage*, *corkage*, and lexemes can have very general meanings like *thing*, *place* is arguable. In any case, this would be the task of a more systematic word-formation semantics, which is still a desideratum.

This solution postulating stem-based compounding and derivation works well for those instances where we can reconstruct a non-native stem as the starting point of the modern formation, as in *astro-naut*, *Mars-naut*, *Anglo-phile*, *audio-metry*, *bibliography*, *dramat-ic*, *scient-ist*, etc. But there is another category, where the foreign stem is shortened. Take the case of *Euro-* in *Eurocentric*, *Eurocrat*, *Eurocity* (*train*), let alone the *Euro* as the currency, where the shortened stem has become a lexeme. The classical stem is *Europ-(a)*, but this has lost its final consonant in the respective formations. Such shortenings happen with native lexemes as well and lead either to simple clippings or clipping compounds, sometimes also called stub compounds. Examples are:

- (10) *telegram* (*cable* + (*tele*) *gram*), *paratrooper* (*para* (*chute*) + *trooper*), *Amerindian* (*Amer* (*ican*) + *Indian*), *news stand* (*news* (*paper*) *stand*), *breathalyser* (*breath* + (*an*) *alyser*), *boatel* (*boat* + (*hot*) *el*), *guesstimate* (*guess* + (*es*) *timate*).

Such formations have to be analysed as consisting of one part which is the result of clipping, which is combined with another constituent having word status. There may also be a partial phonological overlap between the constituents as in *boatel*, *guesstimate*. Such compounds have become relatively frequent in the last decades. Again, we do not have to have recourse to a category "combining form" for their description, since clipping is a process also affecting simple lexical items such as *bus* < *omnibus*, *plane* < *aeroplane*, *taxi* < *taxi cab*, etc.

There are also instances where both parts are clipped, such as

- (11) a. *Chunnel* (*Channel* + *tunnel*), *motel* (*motor(ist)* + *hotel*),  
 b. *Oxbridge* 'the universities of Oxford + Cambridge', *transceiver* 'transmitter + receiver'

Such combinations again are rather heterogeneous. On the one hand, they echo the structures of compounds: thus *Chunnel*, *motel* are clipped versions of determinative compounds, i.e. the *Chunnel* is basically a *tunnel* operating underneath the *Channel*, and a *motel* is basically a *hotel* for *motorists*. *Oxbridge*, *transceiver* are clipped dvandva compounds, which denote a combination (union) of the respective referents, as in *Austro-Hungary* 'an entity which consists of both Austria and Hungary', *concavo-convex* 'having the property of being both concave and convex', similarly G *taubstumm* 'deaf-mute'. This compound type is an innovation in English, which was borrowed from Latin and Greek (cf. Hatcher 1951), because English had lost this old Indo-European compound type. In OE there are two examples, *apumswerian* 'son-in-law and father-in-law', *suhtorfædran* 'nephew and uncle', which also have to be interpreted as 'entity which consists of x and y', but otherwise the type was dead. The combinations in (11) are often regarded as examples of "blending", defined as "merging parts of words into one new word", e.g. by Marchand (1969: 451), who puts them together with

- (12) *smog* = *sm-(oke)* + (*f*)-*og*, *brunch* = *br-(eakfast)* + (*l*)-*unch*, or Lewis Carroll's *Jabberwocky* words *slithy* (*slimy* + *lithe*), *chortle* (*chuckle* + *snort*), etc.

But there is a difference between (11) and (12). The combinations in (11 a) follow the usual determinant/determinatum schema of determinative compounds, except that both constituents are clipped, i.e. a *Chunnel* is basically a *tunnel*, etc. The combinations in (11 b) resemble exocentric compounds such as *hunchback*, *paleface*, where the determinatum is not overtly part of the formation itself and might be interpreted as zero, i.e. *paleface/Ø* = 'someone (= Ø) having a pale face'. Similarly, *Austro-Hungary* can be interpreted as 'entity (= Ø) which consists of both Austria and Hungary'. But none of these interpretations applies to (12). These formations usually denote a referent which is a mixture or crossbreed of the referents of the constituent lexemes and therefore constitute real blends. They have no direct counterpart in compounding and represent the endpoint of the scale suggested in (5) above. Such formations seem to be a relatively recent development, which extended the range of compounding considerably.

#### 4. Conclusion

To sum up: I have tried to show that the notion of "combining form" introduced by the *OED* is not necessary. The categories of "word", "stem", "affix", "affixoid", "clipping" and "blending" necessary in word-formation for independent reasons are sufficient to deal with the formations in question. Therefore, the notion "combining form" is something like a red herring in lexicology, because it creates more problems than it solves and should therefore be given up

## Abstract

We will discuss the evolution of *c'est-clefts* in medieval French and the consequences of their development on the grammar of French. We will show that *c'est-clefts* can be found as early as the 12<sup>th</sup> c. and examine the impact of the loss of word stress and concurrent morphological changes in their evolution. The OF form *ce sui je* became *c'est moi* in Middle French and a similar evolution was noted in Middle English where *it am I* was replaced by *it is I* and finally by *it is me* and yet English has kept word stress. We are proposing that the development of clefts is not only related to prosodic factors but also to due to changes in morphological features that occurred in French during the Middle Ages.

**Keywords:** cleft; focus; prosody; morphology; Medieval French

## 1. Introduction

In this paper we address the problem of the evolution of cleft sentences in Old French. We examine the role of word stress languages and conclude that there is no direct link between the loss of V2 in Old French and the rise of cleft constructions in

---

\* This study was SSHRC Research grant (412-2004-1002) Major Collaboration Research Initiative, "Modelling Change: The Paths of French" under the direction of France Martineau.

*c'est ... qui, c'est ... que.* We give a brief description of the stress system of Old French.

Note that since cleft sentences are found in texts of early Old French (see Rouquier 2007). We will show how one can refer to the use of the left periphery to account for the changes in the expression of FOCUS and the need to provide a dynamic analysis where the pragmatic reading of a sentence is read on the syntactic structure.

### 1.1 Old French: Topic initial V2 language with pro-drop

It has been shown that Old French is a Topic initial Verb-Second (V2) language with pro-drop.

- (1) *Cele nuit pensa li rois Artus assez a ce que Agravains li avoit dit,*  
 This night thought the King Artur enough as to what Agravains to him said  
*mes ne le torna pas granment a son cuer, car il ne creüst pas*  
 but not (it) worry about much in his heart because he (NEG) believe not  
*legierement que ce fust voirs. Au matin s'apareilla por aler au*  
 quite that this was true. In the morning (he) got ready to go to the  
*tornoient.*

tournament

“That night King Arthur thought for a long time about what Agravain has said to him, but he did not worry too much about it because he did not quite believe that this was true. In the morning he got ready to go to the tournament.”  
 (Artu, 13<sup>th</sup> c.)

V2 is an instantiation of a Topic-Comment structure where the Topic is the entity about which something is being said and the Comment, the part of the sentence that says something about the Topic. In example (1), *au matin* is the topic and the rest of the sentence describes what King Arthur did during the morning, that is, getting ready for the tournament. As Marchello-Nizia (1999 : 47) observes, the information structure prevails over the syntactic structure in Old French.

Following Dupuis (1988), we are proposing to derive the V2 structure in example (1) as follows.

- (2) [<sub>CP</sub> Au matin [<sub>C</sub> s'apareilla [<sub>IP</sub> pro] <sub>I'</sub> t [<sub>VP</sub> t [<sub>PP</sub> t [<sub>PP</sub> por aller au  
 tornoient]]]]]]

The V2 structure results from the verb *s'apareilla* moving from its initial position to C. Any other maximal projection – in this instance *au matin* – can move to [<sub>Spec</sub> CP], that is, the Topic position.

### 1.2 Accentual structure of Old French

Old French has a double accentuation: a sentence initial and a sentence final accent (Adams 1987, de Bakker 1997). For Adams, the verb moving to C as in (2) does not tell the whole story about the V2 effect. She observes that V2 languages have also sentence initial (Germanic) accents. It is that combination of verb movement to C and strong initial accent, Adams argues, that distinguishes V2 languages from Verb-First languages like Celtic.

The sentence initial accent makes it possible to focus an element by putting this element in first position as in (3) (de Bakker 1997, Wehr 2005).

(3) ***HALT** sunt li pui e li val tenebrus.*

High are the mountains and the valleys dark.

“The mountains are high and the valleys are dark”

(Roland, 12<sup>th</sup> c.)

Moreover, Wehr (2005) notes that Old French could allow a stress accent— *jo* being a stressed pronoun in example (4).

(4) *-Dunez m' en, sire, le bastun et le guant, / **EJO** irai.*

Give to me it sire the staff and the glove / and I (stressed) will go

*al Sarazin espan*

to the Saracen Spanish

“Give me, sire, the staff and the glove, and I will go to the Saracen of Spain.”

(Roland, 12<sup>th</sup> c.)

According to Wehr, speakers of Old French had no need to use clefts because of the free word accent and the possibility to put focused elements into sentence initial position as it is the case in the previous sentences.

This paper is organized as follows: in section (2), we present a brief review of the previous accounts of the cleft structure in Old French; we examine the relationship between word order change and the development of *c'est*-clefts in section (3). In section 4 we discuss the impact that prosodic changes had on the evolution of clefts. In section (5) we examine the evolution of clefts with respect to changes in the left periphery.

## 2. Previous Accounts for Cleft *c'est ... qui/que*

In her comprehensive study of the evolution of French, Marchello-Nizia (1999) argues that *c'est*-clefts emerged at the end of the 13<sup>th</sup> c. and became more widely used in the 14<sup>th</sup> c. She links the development of clefts in Middle French to the loss of V2 between 1350 and 1500 due to the grammaticalization of the ‘verb-object’ (VO) order in the 13<sup>th</sup> c. and the subsequent grammaticalization of the ‘subject-verb’ (SV) order

starting in the 14<sup>th</sup> c. Once VO is grammaticalized, OV becomes a marked word order in the 13<sup>th</sup> c. and is used to focus an object. Moreover, linear order cannot be used for focusing subjects. Clefts thus offer an alternative to linear order for marking focus.

For Wehr (2005), the rise of the cleft constructions in French is linked to the loss of the single word accent. “The decisive factor is, in my opinion, the change from an autonomous single word to the *mot phonétique*, in which the word stress have been lost.” (Wehr 2005: 369) Wehr states however that it is difficult to pinpoint when this change began.

Although clefts constructions are not part of Adams (1988) study, in a more general approach of the evolution of French, she argues that word order change is not sufficient in itself to explain the loss of V2; rather, it is the loss of sentence initial accent starting in the 13<sup>th</sup> c. combined with the increasing frequency of the SVO order that led to the loss of V2. This follows from Adams’ hypothesis that V2 effects are the result of verb movement to C and the presence of a strong initial accent.

We are calling into question these analyses because we can attest the existence of *c’est*-clefts like in (5) and (6) in the 12<sup>th</sup> c. (see also Kunstmann 1990, Muller 2003 and Rouquier 2007).

- (5) *A sa soeur l’ a moustré au doi, / belement li dist en secroi:*  
 To her sister (she) him pointed to wiht finger / softly (she) him said in secret  
 “*C’est Athes que je la voi...*”

It is Athos that I there see

“To her sister she pointed to him and softly she said in secret:

“It is Athos that I see there...” (Thèbes, 12<sup>th</sup> c.)

- (6) *C’est Huelin qui vos meisele.*

“It is Huelin that mistreats you.” (Gormont, 12<sup>th</sup> c.)

We are proposing that the development of clefts is not only related to prosodic factors but also to other changes that occurred in French during the Middle Ages in the left periphery of the sentence.

### 3. Is word order change responsible for the development of clefts in French?

To answer the above question, we have examined 46 medieval texts in prose and verse from the 12<sup>th</sup> to the 16<sup>th</sup> c. These texts were drawn from the *Base de Français Médiéval* (BFM) – ENS-Lyon and the *Middle French Corpus* of the Centre de syntaxe historique de l’Université du Québec à Montréal (CASH). We were able to attest the existence of clefts as early as the 12<sup>th</sup> c. well before the loss of V2 (see also Kunstmann

1990, Muller 2003 and Rouquier 2007).

(7) *C'est Ysmaine qui parole !*  
“It is Ysmaine who speaks! (Thèbes, 12<sup>th</sup> c.)

(8) *C'est Huelin qui vos meisele.*  
It is Huelin that you mistreats  
“It is Huelin that mistreats you.” (Gormont, 12<sup>th</sup> c.)

Besides clefts, we have identified two other types of *c'est...qui/que* construction in our corpus: complex NPs (ex. 9) and PPs (ex. 10).<sup>1</sup>

(9) *Ne savez vous pas qui il est? C'est Jhesu c' on dit qui est filz de.*  
NEG know you not who he is? it is Jesus that they say who is son of  
*Joseph*  
*Joseph*

“Don't you know who he is? It is Jesus that they say who is the son of Joseph.”  
(Miracles, 14<sup>th</sup> c.)

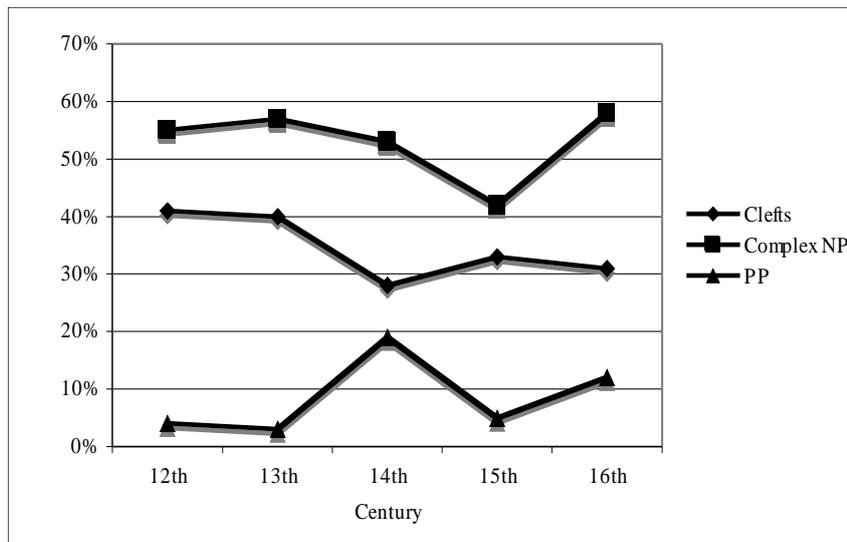

(10) *Ç o est de Basan et de sun frere Basili / Dunt pris les chefts as puis de Haltoïe.*  
“It is about Basan and his brother Basil / of-whom (I) cut the heads in the  
mountains of Haltoie.” (Roland, 12<sup>th</sup> c.)

Figure 1 traces the evolution of these constructions. We believe that the high proportion of clefts in the 12<sup>th</sup> and 13<sup>th</sup> c. samples could be due to a difference in sample stratification; these two samples are mostly composed of texts in verse. We found that on average, texts in verse contain a greater proportion of *c'est...qui/que* constructions than those in prose (58% compared to 42%).

### Figure 1 – The evolution of *c'est...qui/que* constructions

---

<sup>1</sup> Bouchard (2007) argues that sentences such as (9) could hardly be as clefts because the second part of the cleft is a heavy constituent. As for example (10), they are difficult to analyze since they are not very frequent in the beginning of the language.

Clefts rise from 28% to 33% and PPs from 19% to 25% between the 14<sup>th</sup> and 15<sup>th</sup> c. The proportion of clefts stays about the same between the 15<sup>th</sup> and 16<sup>th</sup> c. (from 33% to 31%). PPs on the other hand decrease from 25% to 12%. We propose that this decrease results from the cliticization of *ce* due to the loss of the strong deictic. The decrease of complex NPs from 53% to 42% between the 14<sup>th</sup> and 15<sup>th</sup> c. is linked to the loss of the strong deictic along with the loss of the Topic position [Spec CP]. One reason for the lesser impact of the cliticization of *ce* on clefts could be that the demonstrative acts as quantifier.<sup>2</sup> We will come back to the issue of the cliticization of *ce* in the next section.

Nevertheless, our data show that there is no dramatic rise of clefts with the loss of V2 as we would have supposed if word order change was the determinant factor in the evolution of clefts.

On comparative grounds Ball (1991) notes a similar difficulty in linking the emergence of the *it*-cleft in English to word order change.

The shift in base order from verb-final to verb-medial, in progress from Old English through Early Middle English, had little direct impact on the cleft sentence. It is manifested chiefly as a change in order within the complement. Verb Final structures are rare in the cleft data after Early Middle English; the last examples are found in verse, where the exigencies of rhyme and meter continue to justify grammatical phenomena that are no longer fully productive (Ball 1991: 512)

---

<sup>2</sup> We follow the analysis of Davidsen (2000) who sees *ce* in clefts as imposing a quantificational value on its complement.

If there is no clear causal relationship between word order change and the rise of clefts, then what motivates the emergence of that construction?

#### 4. Are prosodic changes responsible for the development of clefts in French?

According to Lambrecht's formal motivation for the occurrence of clefts, "[t]he occurrence of cleft constructions in a language correlates with the degree of positional freedom of prosodic accents and syntactic constituents in that language." Lambrecht (2001: 488)

We recall that Old French has a double accentuation pattern — a sentence initial and a sentence final accent — as well as word stress. Middle French saw the loss of sentence initial accent and the loss of word stress (Adams 1987, de Bakker 1997, Wehr 2005). What evidence do we have for those prosodic changes? The prosodic changes are evidenced by the loss of nominal flexion, the cliticization of subject pronouns (Adams 1988, de Bakker 1997) and the loss of sentence initial accent (Adams 1988).

These important changes seem to support Lambrecht's formal motivation since French has developed a rigid prosodic structure.

##### 4.1 Loss of nominal flexion

Old French's nominal flexion system consists of the nominative and the accusative/oblique where *-s* marks the singular nominative as in *li rois* in example (11a) and the plural oblique as in *les chevaliers* in example (11b).

(11) a. *Ce est li rois qui me vient afoier.*

It is the king<sub>nom.</sub> who me is coming to hurt

"It is the king who is coming to hurt me." (Ami et Amile, 13<sup>th</sup> c.)

b. *Li gentiz cuens les chevaliers esgarde.*

The noble count the knights<sub>acc.</sub> looks at

"The noble count looks at the knights." (Ami et Amile, 13<sup>th</sup> c.)

According to Buridant (2000), the loss of nominal flexion happened in two stages: (1) the disappearance of the +/- *s* alternation under the influence of the lenition of final *s*; and (2) the decline of the determiner's flexion system where only number is marked as illustrated in (12) and (13).

(12) *ce fut le deable qui le fist pour vous departir d'ensemble.*

it was the devil who him made for you to leave one another

"it was the devil who made her leave you." (Quinze joies, 15<sup>th</sup> c.)

(13) *ce sont choses qui leur touchent*

these are things that to them touch

“These are things that touch them” (Commynes, *Mémoires*, 15<sup>th</sup> c.)

An analysis of the nominal flexion in our corpus reveals that the demonstrative *ce* was mostly an attribute in the 12<sup>th</sup> c. as in (14). The change between the 12<sup>th</sup> and the 15<sup>th</sup> c. is interesting for the analysis of cleft sentences since it reveals that the function of the demonstrative *ce* has changed as it can be observed in the preceding examples.

(14) *Et l'empereres li demande / se çou est voirs que on m' a dit.*

and the emperor him asks / if it is the truth that one to me told

“And the emperor asks him /if it is (the) truth that they told me.”

(Gautier d'Arras, *Eracle*, 12<sup>th</sup> c.)

Figure 2 below maps the evolution of *ce* in subject position.

**Figure 2 – The evolution of *ce* in subject position in *c'est...* *qui/que* constructions**

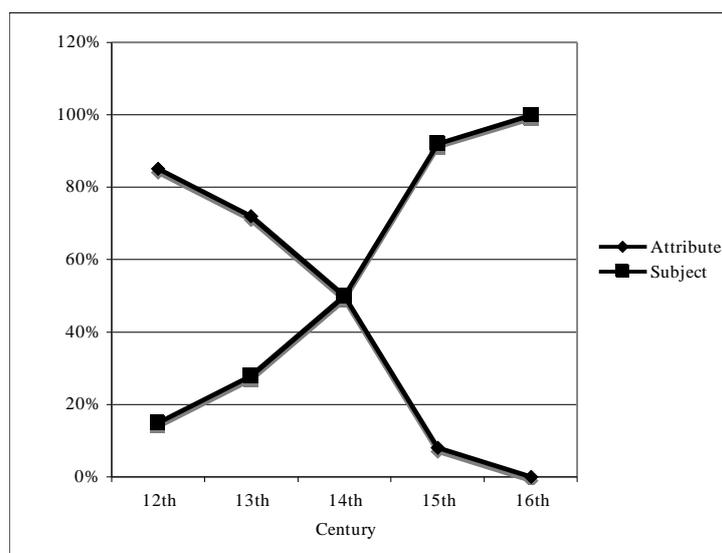

Figure 2 shows three phases in the evolution of *ce* in subject position:

1. The emergence of a new dialect with cliticization of *ce* subject during the 13<sup>th</sup> c.;
2. The rise of that dialect during the 14<sup>th</sup> c.; and
3. The disappearance of the V2 dialect during the 15<sup>th</sup> c.

The evolution of *ce* in subject position follows the move towards the cliticization of subject pronouns in French (Dufresne & Dupuis 1994, Dufresne 1995). Let us now turn to the question of the cliticization of subject pronouns.

#### 4.2 Cliticization of subject pronouns

Subject pronouns in Old French were stressed pronouns (see Moignet 1973, Buridant 2000).

(15) **Jo?** *fait li peres.*

“Me? says the father.” (Aucassin cited by Adams 1988, p. 28)

According to Adams (1988), one of the first manifestations of the cliticization of subject pronouns is the emergence of a new pattern during the 13<sup>th</sup> c. – stressed nominative pronoun followed by the unstressed nominative pronoun as in (16).

(16) *Renars respont: “**Jou je** n’irai.”*

“Renard answers: “Me I won’t go.”

(Cour, Renard cited by Adams 1988, p. 29)

The demonstratives in Old French are stressed pronouns like *jo* (see Moignet 1973, Buridant 2000). Bouchard (2007) observes that the following spellings are found in the *c’est... qui/que* constructions in the 12<sup>th</sup> and 13<sup>th</sup> c.: *ço est, çou est, ce est* and *c’est*. However, only the form *c’est* is attested from the 14<sup>th</sup> c. onward suggesting that the cliticization of the demonstrative is underway.

#### 4.3 Lenition of sentence initial stress

With sentence initial stress, weak pronouns appear to the right of a verb in first position (Adams 1988).

(17) *Cuides **me** tu por si pou esmaier?*

Believe-you me for so little frighten

“Do you believe that I am frightened by so little? ”

(cited by Adams 1988, p. 25)

Scholars of Old French note that early 13<sup>th</sup> c., weak object pronouns start appearing in first position as in (18) indicating the lenition of sentence initial stress.

(18) ***Le me** creantez vos, fet ele, come loiax chevaliers?*

It me pledge you, says she, as loyal knight

“Do you pledge it to me, she says, as a loyal knight? ”

(Queste cited by Adams 1988, p. 26)

#### 4.4 Consequences of the prosodic changes

As a result FOCUS can no longer be associated with Topic as in (3) shown as (19) nor can it be marked by intonation in situ as in (4) shown as (20).

(19) **HALT** *sunt li pui e li val tenebrus.*

“The mountains are high and the valleys dark.” (Roland, 12<sup>th</sup> c.)

(20) *-Dunez m'en, sire, le bastun et le quant,/ E JO irai al Sarazin espan.*

“Give me, sire, the staff and the glove, and I [stressed] will go (to) the Saracen of Spain.” (Roland, 12<sup>th</sup> c.)

These consequences follow Lambrecht (2001: 490) for whom “In many languages, the preverbal subject position is reserved for topical material, resulting sometimes in a complete ban on focus constituents in this position, hence in increased necessity to resort to the use of clefts.”

Since clefts are part of the grammar in French, they can thus replace V2 focus marking strategies such as (19) and (20).

## 5. Changes in the left periphery

The emergence of clefts as a preferred strategy for focus marking in French is linked to substantial transformations between the 12<sup>th</sup> and the 13<sup>th</sup> c. In this section, we will show that this phenomenon is part of changes in the left periphery based on an analysis by Rouveret (2004).

Rouveret (2004) distinguishes two periods with different structural properties: in Early Old French, that is, before 1200/1220, one can find V1 declaratives (21), V2 structures including imperatives (22) and the Tobler-Mussafia effect (23).

(21) *Vait s'en Brandan vers le grant mer*

go refl-loc Brendan towards the big sea

“Brendan goes away towards the sea.” (Brendan, 12<sup>th</sup> c.)

(22) *-Dunez m'en, sire, le bastun et le quant.*

“Give me, sire, the staff and the glove.” (Roland, 12<sup>th</sup> c.)

(23) *Jol vos parduins ici e devant Deu.*

I-it you forgive here and before God.

“I forgive you here and before God.” (Roland, 12<sup>th</sup> c.)

The second period after 1220 sees no V1 declaratives. Moreover, only declaratives and partial interrogations have a V2 structure. The Tobler-Mussafia effect ceases to be observed (Rouveret 2004: 201).

To account for the loss of the Tobler-Mussafia effect, Rouveret proposes that enclisis as in (23) is only possible if the feature [tense] does not depend on a Quantifier/Modal (Q/M) feature. Moreover, he postulates that Force has a Q/M feature in all the structures into which it is projected. Hence, enclisis can only be realized in structure where Force is not present. Accordingly, enclisis would disappear along with

the Tobler-Mussafia effect once V1 structures acquire ForceP. Rouveret further argues that the Tobler-Mussafia is a syntactic phenomenon, not a phonological given that enclisis is also found in structures where the finite verb is not in first position, that is, XP V CL structures like (24).

- (24) *Cil de Ceila liverunt me il as mains Saül?*  
 Those of Ceila leave-FUT me they to hands Saul  
 “Those of Ceila will they leave me in Saul’s hands? ”

(cited by Rouveret 2004, p. 199)

Rouveret proposes to analyze sentences such (24) as structures where the first constituent occupies the specifier of an external project distinct from Force, which he calls a dislocated Phrase or DisP as in (25).

- (25) [<sub>DisP</sub> XP [<sub>Dis</sub>] [<sub>Force</sub> ...] [<sub>FinP</sub> [<sub>Fin</sub> V-CL] [<sub>IP</sub> SUBJECT...]]]

Structures like (25) indicate that all the elements of the V2 structure of Old French are found in the periphery’s lower end along with the tensed verb. Spec,ForceP is where Focus expressions as in (26) can be found.

- (26) [<sub>ForceP</sub> **HALT** [<sub>Force</sub> e ] [<sub>FinP</sub> t [<sub>Fin</sub> sunt] [<sub>IP</sub> t t t li pui e li val tenebrus ]]]].  
 “High are the mountains and the valleys dark.” (Roland, 12<sup>th</sup> c.)

The analysis developed by Rouveret is interesting since it allows us to link two observations. First in Early Old French (EOF), Focus is closely related to the sentence initial stress, and second Focus may be obtained by dislocation. That may explain why cleft constructions are so rare in OF. Spec ForceP can also be the locus for Topic expressions as in (27).

- (27) *Ce est li rois qui me vient afoier.*  
 “It is the king who is coming to hurt me.” (Ami et Amile, 13<sup>th</sup> c.)

The major change observed between the 12<sup>th</sup> [Early Old French (EOF)] and 13<sup>th</sup> c. [Old French] is that Extended Projection Principle [EPP] is a property of INFL in EOF. In order to understand the data under study, we observe that this corresponds to the period where V1 or V3 structures can easily be found. EPP is a property of FIN in OF and this corresponds to the strict V2 period of French. Our study shows that the OF period corresponds to the change we observed in the behaviour of the pronoun *ce* in *c’est...qui/que* constructions.

## 6. Conclusion and summary

We saw that there are many factors motivating the emergence of clefts in French. The following prosodic changes have played a key role in French:

1. The loss of the sentence initial accent entails that it is no longer possible to associate TOP with focus;
2. New information appears at the end of the clause as per the intonation pattern of modern French; and
3. The cliticization of *ce*.

The loss of prosodic means to mark FOCUS during Middle French requires recourse to strategies other than stress under TOP thus leading to the use of a structure already available in Old French - clefts. The cliticization of *ce* allows for the emergence of a new “présentatif”: *c'est*.

Our study allows us to conclude that in a language where FOCUS is expressed by intonation, the use of a syntactic pattern is marked; this explains the relatively low percentage of clefts in EOF. Finally the FOCUS reading of an element in French implies a syntactic movement to the left periphery while in a language such as English where FOCUS can be expressed in situ, FOCUS is a matter of the prosodic structure.

# A formal model of grammaticalization in Slavic past tense constructions

Jesse Tseng

CLLE UMR 5263, CNRS & Université de Toulouse Le Mirail

Toulouse, France

Jesse.Tseng@univ-tlse2.fr

## Abstract

The compound past tense in modern Slavic languages traces back to a copular construction in Common Slavic. The original construction has undergone different degrees of grammaticalization, giving rise to structures with strikingly diverse properties. This study provides a formal account of the evolution of the Slavic past tense in which grammaticalization is modeled as a succession of overlapping reanalyses. The analysis is formalized using representations inspired by Head-driven Phrase Structure Grammar, and the languages considered are Common Slavic, Serbo-Croatian, Czech, Polish, and Russian (from least advanced to most advanced stages of grammaticalization).

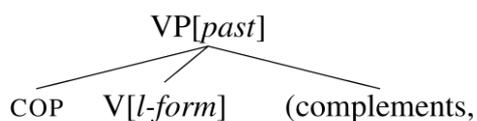

**Keywords:** Slavic languages, auxiliaries, syntactic heads, clitics, grammaticalization

## 1. Introduction

### 1.1. Basic schema

This paper examines the development of the Common Slavic perfect construction, which corresponds to an all-purpose past tense in most modern Slavic languages. The construction involves the so-called “*l*-participle” form of the verb, (usually) accompanied by an element historically derived from the present tense copula. Both elements agree with the subject: the *l*-form agrees in number and gender, the copular form in person and number. The following tree illustrates the general VP schema.

(1)

The label COP is used as a convenient abbreviation, without suggesting anything about the synchronic identity of this element. Similar, I use the term “*l*-form”

for the morphological form of the main verb, in order to avoid presupposing its syntactic function (originally participial, but now a finite form in some of the modern languages). Finally, the diagram above is intended only to indicate syntactic constituency, not the relative word order of the daughters. In other words, COP can also appear after the *l*-form verb. A number of examples are given in (2).

- (2) a. Mi smo vid(j)el-i Mariju. (Serbo-Croatian)  
 we COP.1PL saw-M.PL Mary  
 ‘We saw Mary.’
- b. Koho jsi viděl? (Czech)  
 who COP.2SG saw[M.SG]  
 ‘Who did you see?’
- c. Już widział-a-m ten film. (Polish)  
 already saw-F.SG-COP.1SG that film  
 ‘I have already seen that film.’
- d. Ty spal-a. (Russian)  
 you slept-F.SG  
 ‘You slept.’

It is apparent from these examples that the basic construction in (1) has given rise to distinct structures in the various modern Slavic languages. The copular element COP in particular exhibits different degrees of reduction, up to and including total loss (2d). This paper presents a formal approach to the comparative modeling of the grammaticalization of the Slavic past tense construction as a progression of overlapping reanalyses.

## 1.2. From Common Slavic to modern Slavic

Before delving into the formal analysis, I provide a brief presentation of the languages that will be considered (a more detailed overview of the modern languages can be found in Tseng & Kupść 2007). The data itself are neither new nor controversial; the basic facts about the construction of the past tense are quite well established for each language, with the exception of Common Slavic, where detailed claims about syntactic structure are necessarily speculative. I will not discuss the morphological formation or the phonetic evolution of the *l*-form. For the purposes of this study it is sufficient to note that all of the languages in question have a distinctive *l*-form, exhibiting gender and number agreement with the subject.

### 1.2.1. Common Slavic

I use the label “Common Slavic” to refer to the latest hypothetical stage of the shared Slavic proto-language (hence the roughly equivalent term “late Proto-Slavic”), before the period of dialectal differentiation leading eventually to the development of the modern Slavic languages. There are no full texts from this period (7th to 9th centuries), but it is possible to reconstruct a perfect construction consisting of a full tensed form of the copula (identical to the present tense forms of *byti* ‘be’ in all persons: *jesmĭ, jesi, jestĭ, ...*) and the *l*-form, along with any complements or modifiers. The following constructed example corresponds to the structure shown above in (1):

- (3) *jes-mĭ*            *privezl-ŭ vody*  
COP-1SG            brought-M.SG water  
‘I have brought water.’

Common Slavic is believed to have had extremely free word order. In a sentence such as (3), the *l*-form tends to appear clause-initially or clause-finally, and the copular element is often (but not systematically) found in second position (Press 1983, Meillet 1965: §§283, 550). The following attested examples from some of the earliest Slavic texts (Old Church Slavonic, 10th–11th century) give an idea of the variety of possible word orders:

- (4) a. *Otrokovica nĕs-tŭ            umrŭl-a    nŭ    sŭpitŭ.*  
girl            NEG.COP-3SG    died-F.SG    but    sleeps  
‘The girl has not died, but is sleeping.’ (Mark 5:39)
- b. *Se bo bĕ            znamenĕ    dal-ŭ.*  
PRT    CONJ    COP.3SG    sign            gave-M.SG  
‘For behold he had given the sign (to them).’ (Luke 22:47)
- c. *jakože blagoslovilŭ jesi            vĭsĕ pravĭdĭnikŭi tvoje*  
as            blessed-M.SG    COP-2SG    all    just            yours  
‘as you have blessed all yours who are just’ (*Wenceslas*)

The accepted view is that COP in the Common Slavic perfect construction (and pluperfect, as in 4b) was a finite auxiliary verb. Although it showed some signs of acquiring clitic status in this period, it must still be considered a morphosyntactically autonomous element at this stage, capable for example of hosting the negative proclitic *ne* (cf. 4a, see also Meillet 1965 §540).

### 1.2.2. Modern languages

Earlier stages of Slavic maintained a relatively rich inventory of verbal forms with past tense meaning: the simple aorist and imperfect, and the compound perfect and

pluperfect. The compound forms, originally used only to express perfective aspect, gradually developed into a general past tense, largely supplanting the simple forms, whose endings were insufficiently distinctive. Furthermore, the perfect construction (with the present tense of *byti* as an auxiliary) progressively replaced the pluperfect (cf. 4b above, using the imperfect of *byti*). As a result, in all of the modern languages studied here, the perfect construction is now the primary, all-purpose past tense (although the other forms can still be encountered in certain situations). I will therefore restrict my attention in the rest of this discussion to the descendants of the Common Slavic perfect construction.

#### 1.2.2.1. Serbo-Croatian.

In modern Serbo-Croatian the copular element COP appears in all persons, and has two series of forms, identical to those of the copula *biti*. In most cases COP has enclitic status and appears in the second position clitic cluster along with other auxiliaries (conditional, future) and weak pronouns (5a).

- (5) a. Vidi-o sam Mariju.  
 saw-M.SG COP.1SG Mary  
 ‘I saw Mary.’
- b. Jesi li vidi-o Mariju?  
 COP.2SG INTERR saw-M.SG Mary  
 ‘Did you see Mary?’
- c. Nisam vidi-o Mariju.  
 NEG.COP.1SG saw-M.SG Mary  
 ‘I did not see Mary.’

As shown in (5b,c), however, COP also has autonomous (non-clitic) full forms that can be stressed and negated, just like COP in Common Slavic.

#### 1.2.2.2. Czech.

In contrast, COP in Czech has only clitic forms (appearing in second position). Negation must appear on the *l*-form (6b).

- (6) a. Dnes jsem znovu viděl tento film.  
 today COP.1SG again saw[M.SG] this film  
 ‘Today I saw this film again.’
- b. Ne-viděl jsem tento film. (\*Viděl ne-jsem ...)  
 NEG-saw[M.SG] COP.1SG this film saw[M.SG] NEG-COP.1SG  
 ‘I haven’t seen this film.’

- c. Viděl (\*je) někdo tento film?  
 saw[M.SG] is.3SG anyone this film  
 ‘Has anyone seen this film?’

Moreover, as we can see in (6c), there is no COP element in the 3rd person; the past tense is expressed by the *l*-form alone. The paradigm of COP is thus distinct from that of the copula *být*, which can be negated (e.g. *nejsem* ‘I am not’) and which does have 3rd person forms (singular *je*, plural *jsou*).

#### 1.2.2.3. Polish.

The COP forms in Polish have undergone further grammaticalization to become suffixes (an instance of morphologization), attached most often to the *l*-form (as in example 2c above). In the recent history of the language, however, COP was a clausal clitic, and traces of this status can be seen in examples where the suffix appears on another word to the left of the *l*-form (Andersen 1987).

- (7) a. Dlaczego-ś tak długo nie pisał?  
 why-COP.2SG so long NEG write[M.SG]  
 ‘Why haven’t you written in so long?’  
 b. widział (\*jest) już ktoś ten film?  
 saw[M.SG] is.3SG already anyone this film  
 ‘Has anyone already seen this film?’

In (7a), the 2nd person suffix is attached to the *wh*-word and not to the verb (cf. *pisał-ś*). We can also see from this example that negation appears on the *l*-form. As in Czech, there is no COP element in the 3rd person singular or plural (7b). The Polish copula *być* has a complete paradigm of full forms (including 3rd person forms *jest*, *są*), but as indicated in (7b) these cannot be used in the past tense.

#### 1.2.2.4. Russian.

Finally, the grammaticalization of COP has reached the absolute extreme in Russian, where the past tense is expressed with the unaccompanied *l*-form in all persons.

- (8) a. Ja/Ty/On videl fil’m.  
 I/you/he saw[M.SG] film  
 ‘I/you/he saw the film.’

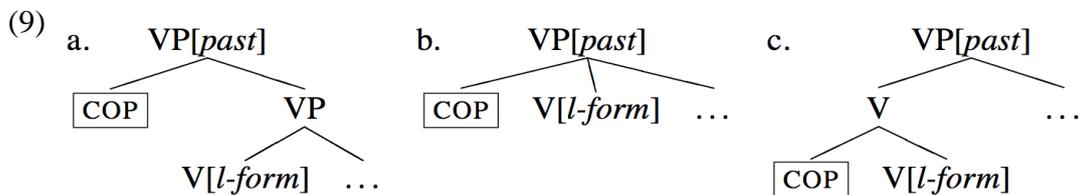

Intermediate stages can be documented in the evolution of Russian; I will return to this issue in section 3.2 below.

## 2. Auxiliary analysis and reanalysis

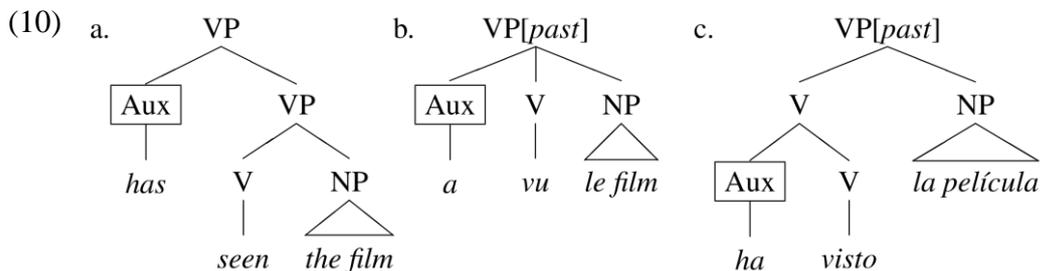

The COP element in the past tense can be analyzed as an auxiliary verb in Common Slavic and in Serbo-Croatian: it appears obligatorily in all persons, and it can carry negation. In this section I present a formal analysis of auxiliary verb constructions using a simplified version of Head-driven Phrase Structure Grammar (HPSG, Pollard & Sag 1994), and then I discuss possible paths of reanalysis leading to further grammaticalization.

### 2.1. Complementation

Cross-linguistically, auxiliary verbs are associated with a number of distinct complementation patterns. The basic schema in (1) can correspond to three possible structures: a VP-complementation structure (9a), a non-hierarchical (flat) structure (9b), or a “complex predicate” structure (9c). (The box around COP in these and all following tree diagrams indicates the syntactic head.)

VP-complementation is found, for example, in English auxiliary constructions (10a). Abeillé & Godard (2003) propose a flat structure for the compound past tense in French (10b), and a complex predicate analysis for the same construction in Spanish (10c):

Arguments for a particular structure come from word order facts and tests for constituency. No strong syntactic claims can be made for Common Slavic, of course, but its highly flexible word order rules out the complex predicate structure in (9c). Given such a structure, we would expect COP and the *l*-form to appear adjacently and always in the same order, and the examples in (4) show that this was not the case in early Slavic. Choosing between (9a) and (9b), on the other hand, is less straightforward.

It seems plausible that the perfect construction originally involved a participial projection consisting of the *l*-form and its complements, transformed into a finite predicate by combining with the copula (i.e. a VP-complementation structure like that of English auxiliaries). If the *l*-form projection appeared in other contexts, for example as a modifier of an oblique NP or in combination with other predicative verbs (‘seem’, ‘remain’, etc.) we would have strong evidence for this analysis, but unfortunately the perfect construction is the only context that can be reconstructed for the *l*-form in Common Slavic. In other words, by this period, the *l*-form appears only in the nominative case and only in combination with COP. In the absence of strong arguments for hierarchical constituent structure, the flat structure in (9b) should be preferred.

Both structures (9a) and (9b) can be modeled formally by assuming valence-sharing in the lexical entry of COP. VP-complementation is generated by the following lexical entry:

$$(11) \left[ \begin{array}{l} \text{SUBJECT} \quad \langle [1] \rangle \\ \text{COMPLEMENTS} \quad \left\langle \text{VP} \left[ \begin{array}{l} \text{VFORM} \quad l\text{-form} \\ \text{SUBJECT} \quad \langle [1] \rangle \\ \text{COMPLEMENTS} \quad \langle \rangle \end{array} \right] \right\rangle \end{array} \right]$$

The complement of the auxiliary is the projection of an *l*-form with all of its complements (i.e. no elements left unrealized in the COMPLEMENTS list), but with an unrealized subject, indicated by the tag [1]. The auxiliary shares this SUBJECT valence with its VP complement, meaning that the unexpressed subject of the *l*-form will eventually be realized as the subject of the auxiliary (subject-to-subject raising).

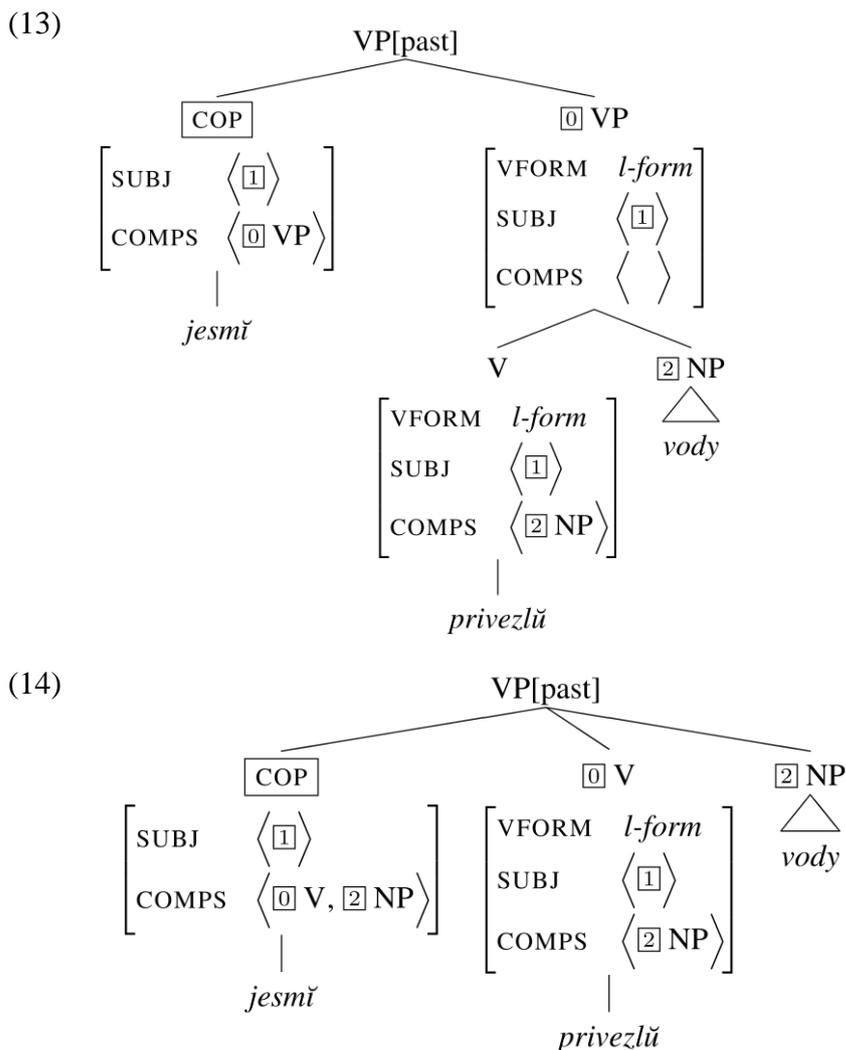

The auxiliary can additionally raise all of the complements of the *l*-form. A lexical entry of this type is shown in (12).

$$(12) \left[ \begin{array}{l} \text{SUBJECT} \quad \langle [1] \rangle \\ \text{COMPLEMENTS} \quad \left\langle \text{V} \left[ \begin{array}{l} \text{VFORM} \quad l\text{-form} \\ \text{SUBJECT} \quad \langle [1] \rangle \\ \text{COMPLEMENTS} \quad [2] \text{ list} \end{array} \right] \right\rangle \oplus [2] \end{array} \right]$$

Here the *l*-form complement must be a non-projecting ( $X^0$ ) element whose subject and complements are all still unrealized. These valence specifications, tagged [1] and [2] in (12), are then inherited by the auxiliary itself. In other words, in addition to subject-to-

subject raising, the auxiliary imposes object-to-object raising. A lexical entry of this type could in fact also be used (in combination with additional constraints) to generate the complex predicate structure shown (9c).

If we assume that the lexical entry of *jesmĭ* in the Common Slavic example in (3) evolved from the type in (11) to the type in (12), we can model the presumed transition from a VP-structure (13) to a flat structure (14):

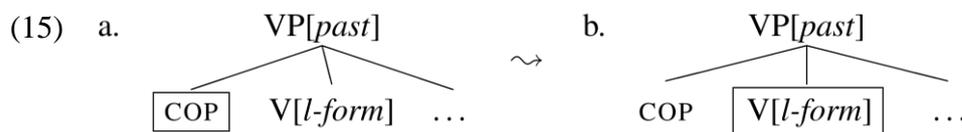

The two analyses of the auxiliary sketched in (11) and (12) overlap, in that they generate the same surface strings. It is likely that (13) and (14) co-existed for some time in covert variation during the early Slavic period.

## 2.2. The case of Serbo-Croatian

As discussed in section 1.2.2.1, the past tense in Serbo-Croatian is essentially a continuation of the Common Slavic construction, if we consider the stressed/negated

forms of COP (*jesam/nisam, ...*). In principle, then, we have the same choice of analyses as for Common Slavic, but in fact there is little evidence for the hierarchical structure in (13) with an intermediate VP constituent. The COP auxiliary in Serbo-Croatian thus has a lexical entry of the type shown in (12), giving rise to the flat structure in (14).

The flat structure also allows for an account of the further grammaticalization of COP reflected in its unstressed, enclitic forms (*sam, si, je, ...*). I suggest that the reduction of phonological and morphosyntactic autonomy indicates a change in grammatical function made possible by the change in syntactic structure. In the hierarchical structure (13), the status of COP as the syntactic head is quite secure, because in combinations involving a word and a phrase, the word is typically the head (Zwicky 1993). In (14), on the other hand, COP and the *l*-form are sisters, both of word rank, and a redistribution of grammatical functions becomes possible.

In other words, COP loses its syntactic head status and becomes a dependent of the *l*-form, which can now be considered to be the finite verb.

The transition shown in (15) is again a covert reanalysis, and both analyses may currently co-exist in Serbo-Croatian. Grammaticalization effects targeting COP, however, provide limited evidence in favor of the assignment of grammatical functions in (15b). I have already mentioned cliticization, which is typical of dependent elements like pronouns. Although COP cannot be plausibly analyzed as a complement, it could have the status of a clause-level marker like the interrogative enclitic *li*. Interactions with other items in the second position clitic cluster can cause COP to be left unrealized. Specifically, the 3rd person singular form *je* is omitted after the reflexive clitic *se*, and less systematically after the 1st and second person pronouns *me* and *te*. These facts are not a priori incompatible with the assumption of syntactic head status for COP. Phonologically empty heads can be accommodated in the formal analysis, even in a surface-oriented framework like HPSG, if adequately motivated.

Finally, an affirmative answer to a past tense yes/no question can consist of the *l*-form alone, without COP:

- (16) Q: Jesi li poje-o? A: Poje-o.  
 COP.2SG INTERR ate-M.SG ate-M.SG

‘Q: Have you eaten? A: Yes.’

Contrast this with the ungrammaticality of the English past participle as a short answer: \*Yes, eaten. The significance of the observation in (16) can of course only be

determined within the context of a complete treatment of the syntax of short answers in Serbo-Croatian. Stressed COP forms can also be used as short answers (*Jesam / Nisam*, cf. English *Yes I have / No I haven't*).

We can conclude that while there are some first indications of the reassignment of grammatical functions represented in (15b), the auxiliary analysis in (15a) still dominates in the Serbo-Croatian past tense, for both stressed and unstressed paradigms of COP forms.

### **3. Further grammaticalization**

#### *3.1. West Slavic*

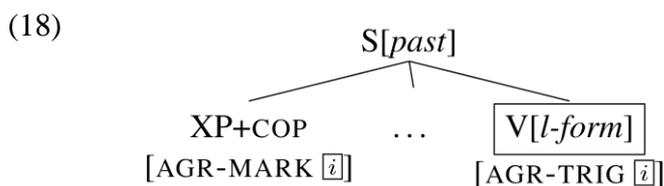

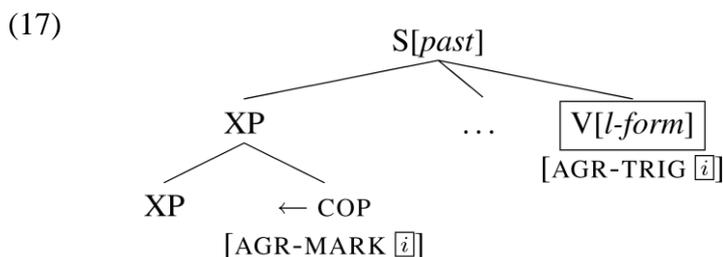

The switching of grammatical functions shown in (15) has reached completion in the development of Czech and Polish. As a result of this reanalysis, COP has lost its verbal head properties in these two languages. As we saw in 1.2.2.2 and 1.2.2.3, COP does not have full, stressed forms and it cannot carry the negation prefix. Its status as a syntactic non-head contributing no lexical semantics makes it a target for further grammaticalization. The absence of relational content also makes reanalysis in the opposite direction (“degrammaticalization” from 15b back to 15a) unlikely, even though the change involved is quite minor. The *l*-form is a stronger candidate for head status, on semantic grounds (Zwicky 1993).

The head-complement dependency in (15a), with the auxiliary selecting the *l*-form, is replaced by an agreement marking dependency in (15b), operating in the other direction. During the transitional period, there was mutual selection between the two elements in the past tense construction. The eventual loss of the auxiliary structure in (15a) was therefore a covert change, since COP and the *l*-form still co-occurred systematically.

In the history of Czech and Polish, however, *l*-forms with 3rd person subjects then relaxed their selectional constraints, and 3rd person COP agreement elements became optional, then erratic, and finally ungrammatical. The reasons for this change must still be determined, through a full examination of historical data. Frequency effects were no doubt a factor, although what is important is the relative frequency of 3rd person reference in the spoken language, which can only be indirectly established on the basis of textual evidence.

In the modern languages, COP forms still appear obligatorily in the 1st and 2nd

persons. Kupść & Tseng (2005) develop an HPSG analysis of agreement marking in Polish, extended to other languages in Tseng & Kupść (2007). The agreement dependency is encoded with a pair of matching list-valued attributes, AGREEMENT-TRIGGER and AGREEMENT-MARKING, allowing the *l*-form to select the appropriate COP form. The second position clitic status of COP in Czech can be (very rudimentarily) represented as in (17), while COP is a suffix in Polish, as sketched in (18).

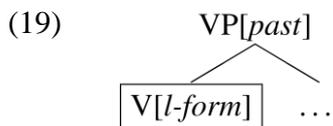

The grammaticalization step of morphologization connecting (17) to (18) is a relatively minor one (corresponding again to a period of competing overlapping analyses). In fact, the Polish “floating” agreement markers as in example (7a) exhibit varying degrees of morphophonological fusion (or “compaction”) with their hosts, and the plural forms (-*śmy*, -*ście*) may be better analyzed as clitics. As mentioned above in 1.2.2.3, a development specific to Polish is the suffixation of the COP element to the *l*-form, as in (2c). This structure does not require the AGR-TRIG/AGR-MARK dependency mechanism, and now accounts for the overwhelming majority of past tense constructions in Polish. The configuration in (18) is now found in less than 10% of past tense examples according to Andersen (1987). Here again there appears to be an asymmetry between the singular and plural suffixes, with the latter occurring more frequently as floating markers. Polish may have followed two separate paths of grammaticalization in parallel, with the suffixed *l*-forms (e.g. *widział-em* ‘I saw’) derived via univerbation of a complex predicate structure of the type illustrated in (9c).

### 3.2. Russian

Russian is the most advanced of all the Slavic languages with respect to the grammaticalization of the past tense: COP is altogether absent in all persons, and the past

tense is a simple tense consisting of only the *l*-form verb.

Data from Old Russian texts suggest that earlier stages of the language resembled what have just seen for West Slavic, with COP forms in the 1st and 2nd persons, but not in the 3rd. Issatchenko (1940) dates the loss of the 3rd person forms to the early 12th century. 1st and 2nd person COP forms were only lost some 200 years later, a change Issatchenko claims was made possible by the increasingly systematic use of overt subject pronouns in this same period. But increased pronoun use could have been the effect, and not the cause. Gardiner (1961) argues that the 1st and 2nd person forms were artificially preserved in written Old Russian and that they must in fact have dropped out of the spoken language at the same time as, if not earlier than, the 3rd person forms.

A final observation about Russian is that all other present tense conjugated forms of the copula *byt'* also disappeared. Here also, the 3rd person singular appears to have received a different treatment: but instead of being lost first, it was preserved the longest. The form *jest'* was recategorized as an invariable existential predicate. It can also be found as an emphatic present tense copula with all subjects:

- (20) počemu my/vy/oni takije, kakije my/vy/oni jest'  
 why we/you/they such such we/you/they is  
 'why we/you/they are the way we/you/they are'

As Gardiner (1961) explains, this use of *jest'* must be an innovation of modern Russian (after the 17th century).

#### 4. Concluding remarks

The evolution of the Common Slavic perfect construction can be modeled formally as a succession of overlapping reanalysis steps. It is assumed to have developed from an original [Aux + VP] structure, similar to that of modern English auxiliary constructions. This hierarchical structure gave way to a flat structure before the end of the Common Slavic period. This change meant that the main verb (*l*-form) was no longer structurally subordinate to the copular form, and allowed a reversal of the dependency relation, with the auxiliary (formerly the syntactic head) becoming a dependent of the main verb.

From this point onwards, the modern languages have advanced at different speeds

through subsequent stages of grammaticalization. Serbo-Croatian maintains the old auxiliary construction, but the auxiliary often appears as an enclitic form. There are only minor indications that the reassignment of grammatical functions just described may be underway. In Western Slavic, the former auxiliary is now an agreement marker, clearly distinct from the copula, and appearing only in the 1st and 2nd persons. In Czech the marker takes second person enclitic forms, while in Polish, grammaticalization has gone further and the agreement markers behave like suffixes in most cases. Finally, in modern Russian, the agreement markers have disappeared altogether, so that the old compound past tense is now fully reduced to a simple tense.

This paper is presented as a diachronic study, but in fact it relies on very little historical data. We are fortunate in that the modern Slavic languages appear to provide a series of snapshots of the development of the past tense, from the most conservative to the most innovative, as if there were a single evolutionary route, and each language simply got off at different stop. While this picture is compelling, and useful for a first study, it is obviously an oversimplification. At every given point, there are several possible paths for further grammaticalization, and more than one path can be followed at the same time by the speakers of the language. This leads to the existence of “layers” in the grammar of each language. This concept was briefly alluded to in the discussion of Polish, but the synchronic facts and the historical record of each language must be examined for a full understanding of the evolution of the Slavic past tense.

# **Cross-linguistically unusual features of Welsh are declining**

**John D. Phillips**

Department of Linguistics, Yamaguchi University,  
Yamaguchi 753-8540, Japan.

## **Abstract**

Welsh has several features which are crosslinguistically very unusual. This paper looks at five such features of the grammar. Each has been stable for over a thousand years, but counts in corpora of spoken and written Welsh, along with published research, show that the textual frequency of each has declined greatly over the last generation or two. The paper briefly asks why. The intensive bilingualism of present-day Welsh-speakers is one reason: cross-linguistically unusual features are inherently more susceptible to loss in a contact situation because they are by definition unlikely to appear in the contact language. On the other hand, English influence so far been largely in vocabulary and idiom. Other grammatical features different to English remain unaffected.

## **1. Background**

Welsh is a Celtic language native to Wales on the western side of Great Britain. There are about 600,000 speakers in Wales, another 100,000 in neighbouring England, and some thousands in the old Welsh settlement in Patagonia.

Forty years ago the great majority of people over the geographically greater part of Wales lived their daily lives in Welsh. One could walk from the north coast of Wales to the south coast through areas where more than 80% of the population were Welsh-speakers and where the language of daily life was Welsh. Since then the number of Welsh-speakers has hardly changed, and their proportion in the Welsh-born population has been stable, but they have become more thinly spread, more evenly mixed with people whose first language is English. As a result, those parts of Wales which until recently were thoroughly Welsh speaking have become bilingual.

Though Welsh had been legally suppressed since Wales was annexed to England in 1536, pressure on the British government from the 1960's on brought about a change in government policy and in public perceptions of the language resulting in widespread official use of Welsh in education, in the media, and in public administration. The city of Cardiff had recently been made the capital city of Wales, and so most of this new official and media activity relating to Welsh has been established in Cardiff — most recently the Welsh Assembly, which works bilingually. Cardiff, in the extreme south-east of Wales, is in an area which has been English-speaking since mediæval times. Much of the rest of south-east Wales became English-speaking in the latter half of the nineteenth century as a result of large-scale immigration into the developing coalfields there, incidentally making the south-east the most populous part of Wales. Hence the last thirty years have seen an explosion of job opportunities for Welsh-speakers in an area without native Welsh-speakers. The result has been that many Welsh-speakers

from the north and west have moved to fill the gap.

At the same time, for reasons not relevant to the present paper, there has been immigration across the border from England into north and west Wales, to the extent that more than a third of the present population of the area were born outside Wales. Over large areas more than half the population were born outside Wales. These recent immigrants are almost all native speakers of English, and they rarely learn Welsh.

As a result of the demographic changes, Welsh-speakers have become more evenly spread over the country. Where there had for centuries been a fairly sharp divide between the part of Wales where Welsh was dominant and the fringes where there were few Welsh-speakers, in the space of a generation the whole country has become bilingual to some extent. Almost all Welsh-speakers now use English extensively in their daily lives, needing English at work and to communicate with neighbours, shopkeepers, etc. Evidence suggests that the average Welsh speaker speaks far more English than Welsh outside the home, and that the proportion of English is increasing quickly.

Although it is difficult to measure the amount of Welsh spoken directly, two indirect measures are available. The first is a statistical calculation from the density of speakers: census data can be used to find the likelihood that a person a Welsh-speaker meets will be another Welsh-speaker (Jones, 2007, pp. 25–26). This gives an idea of the proportion of a Welsh-speaker’s conversations with random interlocutors which could be in Welsh. The second is based on answers to a question in a survey on language usage conducted in 2004 for the Welsh Language Board (Bwrdd yr Iaith Gymraeg, 2006, p. 15). The question asked about the language of the respondent’s last conversation with someone not a member of their family.

<i>Which language will people speak outside the home?</i>	<i>Year</i>	<i>Welsh</i>	<i>Other language</i>
<i>Probability (from density of speakers)</i>	1991	44.3%	55.7%
	2001	37.4%	62.6%
<i>Proportion (from survey)</i>	2004	39.4%	60.6%

Both measures suggest rather similar proportions: the average Welsh speaker outside the home speaks about 40% Welsh and 60% English (the proportion in languages other than Welsh and English is negligible: only 0.2% in the survey). The probability measure suggests that the proportion of Welsh fell 16% between the censuses of 1991 and 2001.

In this environment of intensive bilingualism, where Welsh-speakers are constantly switching between English and Welsh, day in day out, the Welsh language is changing. The language of many younger people is noticeably different to that of older generations. One striking part of the change is that Welsh is losing those crosslinguistically unusual features which make it of particular interest to linguists.

Welsh is a linguistically interesting language. Although it has no unique features, it has several which are cross-linguistically unusual, and some of these, such as consonant

mutation, vigesimal counting, and conjugation of prepositions, have attracted considerable attention in the literature. Below, change in five such cross-linguistically unusual features is examined quantitatively. All five had been stable since the earliest records, well over a thousand years ago. In the space of a generation their use seems to have declined greatly, particularly in the speech of the younger generation.

Evidence for change comes both from recent published studies of Welsh usage, and from frequency counts in five corpora. The five are

1. An example of earlier written Welsh: 24,313 words in four traditional stories from a fourteenth century manuscript (Williams, 1930). The inconsistent spelling of this manuscript restricts use for phonology.
2. Modern formal Welsh: a recent (1988) Welsh translation of the 839,905 words of the Bible (Beibl Cymraeg Newydd, 1988).
3. Modern written Welsh: *Cronfa Electroneg o Gymraeg*, (Ellis, 2001) a sampled corpus of one million words of recently published written Welsh. The corpus is comparable to the LOB corpus of British English or the Brown corpus of American English.
4. Contemporary adult speech: *Cronfa Bangor* (Deuchar, 2004, 2006), a corpus consisting of 52,404 words of unscripted radio interviews and unscripted conversation in equal proportions.
5. Contemporary children's speech: *Cronfa Cymraeg Plant* (Bob Morris Jones, 2006). 133,841 words of unsupervised conversation between seven-year-old children at play. Other comparable studies (Jones, 1998; Thomas, 2007; Thomas & Gathercole, 2005, 2007) have used children of seven, arguing that by this age they have command of the relevant points of grammar.

In general it cannot be assumed that formal written language accurately preserves features of earlier spoken usage. However, the history of the particular features under examination here is well understood, and there is every reason to think that they were as much a part of spoken as of written Welsh in the past. With this in mind, written corpora are taken as representative of traditional Welsh in the corpus counts below.

## 2. Five cross-linguistically unusual features

**2.1. Consonant mutation** The system of word-initial consonant mutation found in all the Celtic languages is well known to linguists. Just how many languages have comparable, grammatically-conditioned alternations is controversial. Phonologically-conditioned alternations are not uncommon, and these can sometimes be quite complex, as that of Nivkh (Shiraishi, 2004). Syntactically and morphologically conditioned consonant alternations are probably found only in the Celtic languages and in northern languages of the West Atlantic family, spoken in West Africa. The Celtic type though shows features of pure syntactic conditioning not found anywhere else.

In Welsh there are three mutations, so words can have up to four alternate forms depending on their initial consonant:

<i>Base</i>	p	t	k	b	d	g	ɸ	ɾ	m	n
<i>Soft</i>	b	d	g	v	ð	∅	l	r	v	
<i>Nasal</i>	m̥	n̥	ŋ̥	m	n	ŋ				
<i>Aspirate</i>	f	θ	χ						(m̥)	(n̥)

(Aspirate mutation of /m/ and /n/ is regular in spoken Welsh but is not part of the written standard.)

There are three types of mutation trigger: (1) specific words, (2) the feminine gender, and (3) specific syntactic positions.

(1) Certain words trigger mutation of the immediately following word. Triggers are closed-class grammatical words: possessive pronouns, prepositions, numerals, particles. The mutation triggered is a lexical property of the triggering word, independent of phonological form or meaning, as in the possessive pronouns /və/+nasal ‘my’, /də/+soft ‘your’, /ei/+soft ‘his’, /ei/+aspirate ‘her’.

	<i>‘head’</i> pen	<i>‘nose’</i> truɪn	<i>‘ear’</i> klist
<i>my</i>	və m̥en	və n̥ruɪn	və ŋ̥list
<i>your</i>	də ben	də druɪn	də gl̥ist
<i>his</i>	ei ben	ei druɪn	ei gl̥ist
<i>her</i>	ei fen	ei θruɪn	ei χlist

(2) Welsh has gender: a noun is either masculine or feminine. The main exponents of gender are anaphoric pronouns and mutation. A feminine noun undergoes soft mutation after a definite article, and itself triggers soft mutation of a following dependent adjective.

(3) Certain syntactic positions trigger soft mutation of the initial word of a noun phrase. Mutated constituents include the object of a finite verb, a noun phrase used adverbially, a vocative, and a phrase which has been moved rightwards.

The following example shows three tokens of soft mutation:

ɾo·iθ	John	liθ	ver	vore	maurθ
give·FUT		lecture	short	morning	Tuesday

*‘John will give a short lecture on Tuesday morning’*

The mutations are: /ɸiθ/ ‘lecture’ → /liθ/ because it is the direct object of a finite verb; /ber/ ‘short’ → /ver/ because it is an adjective dependent on the feminine noun /ɸiθ/; and /bore/ ‘morning’ → /vore/, the first word of a noun phrase used adverbially.

Mutation is unstable in present-day spoken Welsh. For younger speakers in particular, it has become optional. Ball’s study of mutation in the spoken Welsh of adults in two Welsh-speaking areas thirty years ago suggests that Welsh-dominant adults then mutated pretty much as descriptive grammars of Welsh claim they do. Of the soft mutation for instance, he writes ‘The full study records no noticeable change in soft mutation triggering’ (Ball 1993, p. 203). Jones’ study of the use of Welsh in two bilingual towns ten years ago found a very different picture. Of the soft mutation she

writes ‘while still used in a historically appropriate way by two-thirds or more of adult informants, the soft mutation was far more unstable amongst the younger generation who, in most cases, omitted it altogether.’ (Jones, 1998, p. 59). A more recent study of mutation (Thomas & Gathercole, 2005) in the spoken Welsh of adults and children in the north west, where the concentration of Welsh-speakers is highest, found somewhat higher rates of mutation than Jones, but still nowhere near 100%.

All three of the studies referred to above counted the proportion of words mutated in the context of a specific trigger, for instance the proportion of adjective tokens mutated after a feminine noun. A different way of quantifying change in mutation rates is simply to count the proportion of mutated words (tokens) in a corpus. One can count either mutated words as a proportion of all words, or mutated words as a proportion of words beginning with a mutable consonant.

<i>Proportion of words productively* mutated</i>	<i>all words</i>		<i>words beginning /p,t,k,b,d,g,m,t,r/</i>	
	Bible	17%		42%
	modern written	15%		40%
	adult speech	9%		25%
	children’s speech	3%		10%

Looking at words beginning with mutable consonants for instance, about 40% are mutated in written Welsh. We can take it that this is approximately the traditional incidence of mutation. Present day adult speech has an incidence somewhat less than two-thirds of this; children’s speech has a quarter.

These figures complement and re-inforce the impression gained from earlier research, that mutation has become optional in speech and is becoming rarer.

**2.2. Voice opposition in Welsh consonants** Welsh has a voicing contrast which includes Welsh’s three plosive, three fricative, two liquid, and three nasal consonants. A voicing contrast is crosslinguistically common with plosive and fricative consonants, but rare with liquids and nasals. To have the contrast over the full range, as in Welsh, is very rare.

	<i>plosive</i>			<i>fricative</i>			<i>liquid</i>		<i>nasal</i>		
<i>voiceless</i>	p	t	k	f	θ	χ	ɬ	ɾ	m̥	n̥	ŋ̊
<i>voiced</i>	b	d	g	v	ð		l	r	m	n	ŋ

The voiceless lateral is rather special. It is well known to the inhabitants of neighbouring countries as it is frequent in place names (such as *Llanelli* /ɬan'elɨ/ or *Pwllheli* /puɬ'heli/). Welsh-speakers too are self-conscious about it, considering it unique to Welsh and a symbol of Welshness. The attitude is typified by an article from the main English-language daily newspaper in Wales entitled *Rare Welsh tongue-twister turns up in Nigeria* (Rees, 2005). The report begins ‘The double ll sound that makes

\* *Productively mutated* means that the word is mutated in response to a trigger. A number of common words have a permanent mutation in the modern colloquial language and these are not counted. Examples are interrogative words such as *beth* ‘what?’, from *pa beth* ‘what thing’, and *gyd* ‘all’, as in *gyd o mw* ‘all of them’, from *i gyd* ‘together’.

Welsh special, yet so difficult for others to pronounce, is not so unusual after all. It has now emerged the tongue-twisting sound is also used in a Nigerian language.’ The voiceless lateral seems unlikely to disappear, but frequency counts show that the other unusual voiceless consonants are becoming increasingly rare in spoken Welsh, due both to voicing of originally voiceless consonants, and to changes in the grammar which conspire to make voiceless nasals rarer.

If a word-initial voiceless rhotic is used in a context triggering soft mutation, it will be voiced: /r̥oi/ is ‘give’, but /urθ roi/ is ‘whilst giving’. In the present-day spoken language, /r̥/-initial words which are often subject to mutation may be re-analysed as /r/-initial. A count of the commonest such words in the spoken corpus (/r̥iu/, /r̥əubəθ/, /r̥oi/, /r̥oid/, /r̥əuin/, /r̥aid/, /r̥əule/) showed that /r/ was used 68% of the time where /r̥/ would have been expected.

Yet other /r̥/-initial words rarely or never occur in contexts triggering mutation. The demonstratives /r̥ein/ ‘these’, /r̥eina/ ‘those’, /r̥eini/ ‘those’ are examples. There are few tokens of these words in the adult conversations, but plenty in the children’s corpus where they have initial /h/ in about half the examples — i.e. the pronunciation is /hein/, /heina/, /heini/. Personal experience suggests that this pronunciation is not confined to children’s speech.

The voiceless nasals occupy a special position in Welsh phonology, in that they are closely connected with the system of consonant-initial mutation. Few words have a radical voiceless nasal: most voiceless nasal tokens in traditional Welsh result from nasal or aspirate mutation triggered by a preceding word or prefix. The word /kəmr̥i/ ‘Wales’ often turns up in text in its mutated form /ŋəmr̥i/; the opposite of /klod/ ‘honour’ is /aŋlod/ ‘dishonour’. With the decline of the mutations, it is to be expected that the frequency of voiceless nasals in speech will decline, and corpus counts suggest that this is the case. The number of voiceless nasals (m̥, n̥, ŋ̥) per 10,000 words, excluding the word /ŋu/, is

Bible	86
modern written	93
adult speech	28
children’s speech	3

Adults use voiceless nasals at about a third of the traditional rate (represented by the written corpora); children hardly use them\*.

The counts above exclude the colloquial third person plural pronoun /ŋu/. This word, which has a radical /ŋ̥/, is not found in the Bible and is comparatively rare in written Welsh in general, but common in informal speech. It occurs frequently in both the spoken corpora but in the children’s speech the initial nasal is voiced in 98% of tokens. Again personal experience suggests that this pronunciation is not confined to children’s speech.

---

\*It is not that children cannot produce voiceless nasals: there are examples in the speech of 31 of the corpus’ 85 children.

**2.3. Vigesimal counting** The traditional counting system of Welsh is vigesimal. The number 158, for instance, is expressed as ‘seven twenties and eighteen’:

Tair    ar    bymtheg    a    saith    ugain  
3        on    15            &    7        20            =158

Fifty years ago this was the natural way to express numbers in Welsh. A biographical note mentions a ‘mountainous farm of about 140 acres’ *fferm fynyddig o ryw saith ugain cyfer* (Bywgraffiadur Cymreig, 1953, under *Ellis Pierce*); a report on a meeting talks of ‘about 140 to 160 young people’ *rhyw saith i wyth ugain o bobl ifainc* (Morgan, 1957: 13) — literally ‘seven or eight twenties’.

Over the past half century, an invented decimal counting system, introduced first in schools, has spread in Wales to the extent that the traditional system is now hardly used, and is probably not understood by many younger speakers. In a recent article on counting systems Bernard Comrie (2005, p. 210) notes that “we live in a basically decimal world.” About the languages used for the *World Atlas of Language Structures*, he writes: “Not only are most of the languages in that sample decimal, but the decimal system is also dominant in nearly every single macro-area of the world.” He goes on (p. 228) to discuss Welsh: “the traditional vigesimal numeral system of Welsh [...] has been replaced for most purposes for most speakers by an artificial transparent decimal system.” Comrie’s comments on Welsh are supported in detail by Roberts (2000), who also traces the origins and spread of the new decimal counting system.

**2.4. Inflected prepositions** The prepositions of Celtic languages conjugate for person and number in a similar way to verbs. Portmanteau forms combining an adposition and a pronoun are found in a few other languages, but usually are transparent combinations of adposition and pronoun. Conjugation of prepositions with paradigms similar to those of verbs is crosslinguistically very rare.

Paradigms for two common prepositions belonging to different conjugation classes, /o/ ‘from, of’ and /urθ/ ‘to, by’, are shown:

	<i>singular plural</i>	<i>singular plural</i>
<i>1</i>	ohonov ohonom	urθiv urθim
<i>2</i>	ohonot ohonoχ	urθit urθiχ
<i>3m.</i>	ohono ohonint	urθo urθint
<i>3f.</i>	ohoni	urθi

Failure to conjugate is ungrammatical in traditional Welsh: there is not a single example in any of the three written corpora. Loss of the conjugations though is a striking feature of present-day colloquial Welsh, particularly with younger speakers, and particularly in parts of the country where English is dominant. Jones (1998, pp. 71 & 176) notes very low levels of conjugation in her South-Walian subjects, somewhat higher with the Northerners. The oldest speakers in both areas have levels close to 100%.

Counts in the spoken corpora support Jones’ results. Jones gives only aggregate percentages for prepositions as a whole; the corpus counts show that the details are different for each preposition. Some prepositions, such as /o/, generalise a base form:

typical examples are

dui o nu	đui o ni
two of them	two of us

where traditional Welsh would have /dui ohonint/, /đui ohonom/. Other prepositions, such as /urθ/, generalise an inflected form: typical examples are

urθo mami	urθo hi
to Mummy	to her

where traditional Welsh would have /urθ vami/, /urθi/.

With regard to frequency of conjugation, the five commonest prepositions fall into two groups: with /gan/, /wrth/ and /o/ between 65% and 75% of relevant examples used a generalised form; with /am/ and /ar/ about a quarter of relevant examples used a generalised form, the conjugations being better maintained.

It seems that conjugation has become optional for younger speakers, and unusual for at least some of the commoner prepositions.

**2.5. Equative adjectives** As well as a comparative and superlative form, Welsh adjectives have an equative form made with a suffix or by irregular change or suppletion. Morphological comparatives and superlatives are common in Europe but rare elsewhere; a morphological equative is very rare, being found in only a few languages other than Welsh (Cuzzolin & Lehmann, 2004; Haspelmath & Buchholz, 1998).

In Welsh the regular equative suffix is /ed/.

<i>Positive</i>	<i>Equative</i>	<i>Comparative</i>	<i>Superlative</i>
'təuiɪ	tə'uəɪed	tə'uəɪaχ	tə'uəɪav
<i>dark</i>	<i>as dark so dark</i>	<i>darker</i>	<i>darkest</i>

Stress is regularly on a word's penultimate syllable, so moves predictably in the example; the vowel change /i/ → /ə/ is also regular. Typical examples of the equative from written corpora are

aeθ ər hoɪ le kɪn dəuəɪ.ed a r avagðɪ  
 went the whole place as dark-EQ as the utter dark

'The whole place went as dark as pitch'

ni wel-ai r turv ɾag təuəɪ.ed ə nos  
 NEG see-IMPF the commotion because dark-EQ the night

'He couldn't see the commotion because the night was so dark'

Corpus counts suggest that while the comparative form remains fully productive in present-day Welsh, the equative form, though of frequent occurrence and standardly used for equative comparison in the past, is very much less common in present-day written Welsh, and is hardly used in speech. Its place has been taken by a construction similar to that of English.

<i>Proportion of inflected forms in total inflectable comparisons</i>		<i>Comparative</i>	<i>Equative</i>
	old written	100%	100%
	modern written	93%	48%
	adult speech	97%	11%
	children's speech	81%	0

### 3. Why are these features falling out of use?

If one asks why it is that equative forms of adjectives are falling out of use when comparative forms remain productive, there is no very clear answer. Obviously English influence has something to do with it. Present-day Welsh speakers find themselves in a state of intensive bilingualism. The average Welsh-speaker is switching between Welsh and English, depending on interlocutor, over and over again, day in day out. As has often been pointed out in the past, the mental burden can be lightened by bringing the two languages closer to each other (see the discussion in Ross, 2007). Since English is externally fixed, it is Welsh that must change to become more like English. English adjectives have a comparative form so there is no problem there, but since the equative form is peculiar to Welsh, bilingualism would be less of an effort if Welsh used a periphrastic equative construction like that of English. Hence the change.

These sorts of arguments are commonly found in studies of language change due to contact, but seem to give only a partial answer in the Welsh case, since they do not explain why it is specifically the cross-linguistically unusual features of Welsh that are changing. Though recent decades have seen much influence of English on Welsh in vocabulary, word senses, idiom, and modes of expression, there has so far been comparatively little influence on syntax and morphology. It is very easy to produce examples of morphology or syntax where Welsh differs from English and where the Welsh construction seems independent (from the viewpoint of typology or language universals) of other parts of the grammar, and so could easily mimic English, but does not. Three simple examples follow.

(1) In the second person pronouns, translating English *you*, Welsh has a TV system. The familiar singular pronoun is /ti/ and the plural is /chi/, also used as a respectful singular. One might expect /ti/ to fall out of use and leave /chi/ as an exact translation of *you*. In fact the present tendency, with the informality of modern society, is to extend /ti/ to a wider range of singular contexts.

(2) Welsh uses a singular noun with numbers, e.g. /iŋ ʰiθ/ 'one lecture', /dui liθ/ 'two lectures'. (The number triggers soft mutation, voicing the initial lateral.) The English-style use of the plural with numbers other than *one* is not found.

(3) Unlike English, Welsh has no indefinite article. This is a particularly interesting feature, because other languages in similar contact situations have very often developed indefinite articles, almost always based on the number one (Heine & Kuteva, 2006, §3.1). In Welsh there is no sign of /iŋ/ 'one' taking on the functions of an

indefinite article. Neither does any other semantically appropriate word such as /r̥i+u/ ‘some’, as in /r̥i+u liθ/ ‘some lecture or other’, seem to be extending its range of use.

Cross-linguistically unusual features will always be prime candidates for contact-induced change, simply because they are cross-linguistically unusual. They are statistically unlikely to be present in a contact language, so that influence from a dominant language will almost always oppose a cross-linguistically unusual feature. Amongst the features discussed above, this is clearest with the counting system. Not only English, but also the Arabic written notation which all Welsh-speakers must master, are decimal. All modern Welsh-speakers need to be at home with decimal counting, both for English and for writing in figures. Converting between vigesimal and decimal numbers is difficult, so that maintaining both systems is a considerable mental burden: the result is the demise of the vigesimal system.

Some cross-linguistically unusual features are inherently unstable, which is why they are unusual in the first place. Voiceless nasals for instance have little acoustic energy and are hard to hear. Cross-linguistically they have a tendency to drop out or fall together with their voiced counterparts (Blevins 2004, p. 30). The reason why they have remained stable over a long period in Welsh is probably that they have a grammatical function as part of the system of mutations. Blevins (2004, pp. 204-209) adduces examples from several languages of normally unstable phonological contrasts which seem to be maintained because they have a grammatical function, suggesting that “the grammatical role of phonological contrasts can inhibit otherwise common instances of phonetic mergers” (p. 205). In Welsh, with the decay of mutation, voiceless nasals no longer have a grammatical role, and since their functional load is otherwise small, and they do not exist in English, the way is open to change.

Of course this begs the question of why the mutations are decaying. The Welsh mutation system is the result of an unlikely combination of individually unexceptional changes, which happened in the distant past. Mutation is cross-linguistically rare because it is unlikely to arise, not because it is unstable once it has arisen. Except for a few minor analogical changes, the Welsh system has been stable for fifteen hundred years or so. The same is true of inflected prepositions and equative adjectives. Surely the fact of linguistic rarity in itself can have nothing to do with a feature’s demise.

# **THE PROBLEM OF THE INTERPRETATION OF THE BORROWED CHARACTERS IN OLD KOREAN LITERATURE, THE HYANGGA**

**Jung-Hee An**

University of Hamburg  
Edmund-Siemers-Allee 1  
20146 Hamburg, Germany  
Junghee\_an@hotmail.com

## **Abstract**

In this paper I have discussed some fundamental problems in the interpretation of Hyangga by demonstrating the critical role of the content-oriented interpretation and advocate a systematic linguistic analysis of each character. The analysis of the syntactical environment of a character, i.e. its position in the sentence and its combinable features with other characters, can provide plausible evidence to support its syntactical and semantic functions. In order to avoid the repetition of incorrect decipherment of the Hyanch'al script, it is necessary to strictly follow the principle to first finish formal linguistic analysis, and only then start interpreting.

**Keywords:** Old Korean, Hyangga, Hyangch'al, borrowed characters

## **1. Introduction**

This paper aims to demonstrate the problems of the interpretations of the borrowed characters in Old Korean literature, the Hyangga and suggests a method of an analysis of a character or clusters of characters in its position and syntactical environment, in which they occur.

Hyangga, literally to be translated “songs of our Land”, means the songs of Shilla (?-935) in contrast to those of T'ang - China. A total of 25

Hyangga is handed down; 14 of which come from Shilla and the other 11 from Koryo (935-1392). The Hyangga are written in the so-called Hyangch'al script.

In the Hyangch'al writing system letters borrowed from Chinese characters have been read according to the sound (phonogram) or the meaning (semantogram) of the original Chinese character. Unfortunately the reading/writing tradition of Hyangch'al was broken off, presumably in the middle of the Koryo period. As a result in many instances it is not clear how the text has been read originally. For the deciphering the knowledge about various usage of Chinese character provides only a semantic or a phonetic clue, and there is no reference whether a given character represents a morpheme or a sound. Scholars maintain that a certain sequence of Chinese characters stands for a certain word having this or that meaning and having been pronounced in a certain way. Due to the small volume of surviving Hyangga it is not easy to find multiple spellings of many words, morphemes and sounds which would support hypothetical readings.

Although since the beginning of 20<sup>th</sup> century many attempts have been made to decipher the surviving texts, many of the details of the Hyangga

remain still in darkness, unexplained. Especially the character which has a grammatical function, its syntactic and morphological features are not totally identified.

In following I will present some fundamental problems in the interpretation of a character or a sequence of the characters in Hyangga.

## **2. Interpretation of the characters representing a word, which is lost**

The inherent difficulties involved in the decipherment of Hyangch'al are due to the small number of the Chinese characters used. Much of the traditional reconstruction of Hyangga shows a methodical shortage in the reconstruction of the sound or meaning of the character. In reading Hyangga the middle Korean phonology, lexis and grammar are drawn arbitrary without any fundamental linguistic analysis.

For example, the line of the Koryo-Hyangga '*Ch'ingch'an Yorae ka*' 稱讚如來歌 "A Song of Glorification of the Tathāgatas" reads;

際于萬隱德海兮

Yang Chudong (1957) reads this line 際于萬隱 德海兮 kas öpsün tök patalhal “the endless Sea of Virtue” making a break between 際 \*kas and 于萬隱 \*öpsün, while Yu Ch’anggyun (1994:901) 際于 萬隱 德海兮 öuru mön tök patalhal “the far away detached Sea of Virtue” between 際于 \*öuru und 萬隱 \*mön.. While the two scholars agreed to the interpretation of the graphs 德海兮 “Sea of Virtue” they differ in their interpretations of the first four graphs 際于萬隱.

Yang interprets 際 as a semantogram representing Old Korean \*kas ‘end, border’ and the sequence of the graphs 于萬隱 \*öpsün as a word stem representing the meaning ‘to not be there’ and reads them like Middle- or Modern Korea. Thus the graphs 際于萬隱 are interpreted as an adjective phrase meaning “boundless, endless, without border”. In contrast, Yu reads 際于 as an adverbial meaning ‘very’ and 萬隱 as a phonogram representing \*mön ‘far, distant’, again stems from Middle- and Modern Korean. Both scholars deciphered 隱 ‘hidden’ as a phonogram representing the Old Korean particle \*-n.

Though in regard of contextual relation, Yang’s semantic interpretation sounds plausible, but he could not provide any linguistic cues which would confirm his interpretation. The first character 際 can be confirmed by me as

a semantogram meaning ‘end, border’ because the character 際 occurs 3 times in Koryo Hyangga and it represents the same in all these occurrences.

Furthermore, the result of my study on the negation in Old Korean confirms the meaning of 于萬隱 ‘not to be there’, but there is no way to know for sure that the Old Korean word can be read \* öpsün. 于萬隱 might have represent some other lost Old Korean word meaning ‘to not be there’. Even if the Old Korean word were cognate to later Korean öps-, there is no guarantee to have been phonological identical. The sound of the letters then must be reconstructed on the basis of the historical phonology of Chinese and the arbitrary reading based on Middle-Modern Korea should be avoided.

### **3. Literary interpretation versus morpho- syntactical analysis of the characters**

Secondly, the scholars tend to decipher the meaning of unknown words by combining it to their background knowledge of Middle- or even Modern Korean and often neglect the graphic display in the text, the environment and the position of a grapheme and the sequences of graphemes as a basement of linguistic analysis of the source.

To my observation many of the scholars who interpret Hyangga rely highly upon the previous concept-oriented interpretations rather than on the original textual data, so that the incorrect interpretation of the source is repeated. For example, observe the following line of the Silla-Hyangga *`che mangmae ga'* 祭亡妹歌 “A Song for the Deceased Sister”

彌𡇗刹良逢乎吾道修良待是古如

As for the segmentation of the line into meaningful units the scholars' opinions are controversial. They differ in their opinion, as to with which character the sentence ends or begins. One group (see Yu Ch'anggyun 1994:732), the majority of scholars, punctuate after the character 吾 as a final ending and take the character 道 as the initial letter of the following sentence.

Mitach'al ae maspol na 彌𡇗刹良逢乎吾 “I, who will meet [S] at the

Temple of Mita”

To tasara kituri goda 道修良待是古如. “following the Bodhi-Path

and waiting”

Another group of scholars (see Hong Kimun 1956: 266) reads 乎 as a final ending and 吾 as the initial letter of the following sentence.

Mitach'alae maspoho 彌𡇗刹良逢乎 “for the reunion with Amitaba”

Na To taka kitri koda 吾道修良待是古如 “following the Bodhi- Path

I will wait [for the reunion]”

Because the segmentation in the line is not based on the morpho-syntactical analysis but on intuitive, mainly concept-oriented knowledge of Buddhism, they cannot provide plausible linguistic evidences for supporting their opinion, whether the character 吾 could be seen as a last element of a sentence or the first letter of the following sentence. It goes without saying that this leads to different interpretations of the meaning of the song.

吾 \*’I’ appears 8 times in the Silla-Hyangga and it is always used initially and comes neither in second nor in final position. Considering the semantic value of the character 吾 \*’I’ and its position in the line, it is not difficult to confirm the grammatical function of 吾 \*’I’ as a pronoun representing ‘I’, which is the subject of a sentence.

#### **4. Interpretation of the variant of a character:**

##### *4.1. Sentences with the character 賜*

The character 賜 occurs 13 times in Silla-Hyangga and 12 times in Koryŏ-Hyangga. In all occurrences 賜 follows a character or a cluster of

characters representing an action or an attribute of a person and functions as a honorific marker, equivalent to -si- in Modern and Middle Korean. The character 賜 was attached directly to the characters representing a verb stem.

法界 滿賜隱 佛體 “the Buddhas who *fill* the Dharmarealm”

佛體頓叱 喜賜以留也 “the Buddhas will also *rejoice*”

佛影 不冬 應爲賜下呂 “Will the Buddha’s Image not *be mirrored* there?”

In Hyangga a Chinese character functioning as a grammatical morpheme is normally a phonogram. The reconstructed pronunciation of 賜 in Early Middle Chinese, which is the language of the *Qieyun* rhyme dictionary of 601 A.D., is [siə<sup>h</sup>] or [si<sup>h</sup>] (Pulleyblank 1991:292).

Up to now the Korean scholars (see Yu Ch’anggyun 1994:1072) claim that the honorific morpheme 賜 in Hyangga has a variant, namely the character 事, and that 事 features the same phonetic and morpho-syntactical functions. This claim should be corrected by reason of my analysis below. In following I will examine the sentences with these characters in terms of their morpho-syntactic, phonetic and semantic functions and correct the previous misinterpretations of the sentences.

#### 4.2. Sentences with the character 事

The character 事 does not occur in Silla-Hyangga but it appears 3 times in Koryŏ-Hyangga.

- 1) 舊留然叱爲事置也 (普皆廻向歌)
- 2) 又都佛體叱事伊置耶 (摠結无盡歌)
- 3) 伊留叱餘音良他事捨齊 (摠結无盡歌)

In example 2) and 3) 事 functions as a noun, i.e. as a semantogram meaning ‘work/task’, thus 2) 佛體叱事 is to be interpreted as “works of Buddha” and 3) 他事 ”other works”. In these two cases it is clear that the character 事 is not a honorific marker.

The sentence, in which 事 is considered as a variant of the honorific marker 賜, reads 1) 舊留然叱爲事置也 “In the past it has done always thus”. In this sentence 事 follows the verb 然叱爲 \*kürōha “to do thus” and precedes the final endings, thus as a pre-final ending it is assumed to be a phonogram.

However, the pronunciation of the character 事 in Early Middle Chinese is reconstructed as [dzi<sup>h</sup>] or [dzi<sup>h</sup>] (Pulleyblank 1991:284) and shows a wide difference in its phonetic value when it is compared to [si<sup>h</sup>] or [si<sup>h</sup>] for 賜. In contrast to the honorific marker 賜 with voiceless sound, 事 is voiced. In

addition, the context of the text supports that 事 is not a honorific marker but a noun meaning ‘work/task’ as that of the other two examples.

Resulting from above analysis it can be ascertained that 事 is not a variant of the honorific morpheme 賜. In other words, there is no other variant of the honorific 賜 in Hyangga which bears the same morpho-syntactical functions.

## 5. Conclusion

In this paper I have discussed some fundamental problems in the interpretation of Hyangga by demonstrating the critical role of the content-oriented interpretation and advocate a systematic linguistic analysis of each character. The analysis of the syntactical environment of a character, i.e. its position in the sentence and its combinable features with other characters, can provide plausible evidence to support its syntactical and semantic functions. In order to avoid the repetition of incorrect decipherment of the Hyanch'al script, it is necessary to strictly follow the principle to first finish formal linguistic analysis, and only then start interpreting.

## **Classical Studies and the Emergence of Comparative Linguistics: What was lost and what was gained?**

**Kurt R. Jankowsky**

Georgetown University  
Washington, DC 20057, USA  
jankowsk@georgetown.edu

One might rightly claim that the study of Classical languages, over the long range of centuries during which it evolved and matured, had attained by the beginning of the 19<sup>th</sup> century a status of excellence that was difficult to match and outright impossible to surpass. (For greater details cf. Jankowsky 2001a). Occasional periods of stagnation were dealt with effectively, sometimes without delay, sometimes in a rather leisurely fashion. Those intermittent periods of reduced productivity could, however, in no way detract from the exalted position of Classical Studies, since the foundations of their widely acknowledged excellence were solidly laid and for a considerable time had proven to be well beyond the reach of any challenging criticism. After all, along with ancient Hebrew, Classical Greek and Latin were the original languages of the Bible, and hence for centuries had been regarded as the “Three Holy Languages” (cf. Jankowsky 2001b: 1182). Subsequent investigations of languages other than those three throughout the Middle Ages and beyond were greatly impeded by the somewhat dogmatic belief originating in the 3<sup>rd</sup> century A.D. (cf. Jankowsky, *ibid.*) that Hebrew, the oldest of the Biblical languages, qualified as the mother of all other languages, a misconception that only Gottfried Wilhelm Leibniz (1646-1716) could undertake to dispel. Leibniz approached this topic repeatedly, stating in one case that “[t]o say the Hebrew language is original is like saying that the trunks of the trees are original” (‘Linguam Hebraicam primigeniam dicere idem est ac dicere truncos arborum esse primigenios.’ [Quoted after Feller 1718: 80]). He continued that for him there was no reason to believe that Hebrew was any closer to an assumed original language than any of the other related languages.

Equally damaging was the contention that a thorough study of those “Holy Languages” would yield results vastly surpassing all insights that could be derived from the study of any and every other language. It sanctioned, as it were, the disregard of, or even contempt for, all vernacular languages, even though Wilhelm von Humboldt’s

(1767-1835) work *Über die Verschiedenheit des menschlichen Sprachbaues und ihren Einfluss auf die geistige Entwicklung des Menschengeschlechts* (*On the Diversity of Human Language-Structure and Its Influence on the Mental Development of Mankind*), published in 1836, had at long last removed every possible justification for such an attitude.

On the European scene, the experience of being exposed to advanced Classical Studies was expected to have, for the members of the privileged minority being provided with university education, a lasting impact on their personal as well as their professional life. And in most instances this was indeed the case, as is convincingly demonstrated, e.g., by an account that Karoline von Wolzogen (1763-1847), sister-in-law of Friedrich von Schiller (1759-1805), gave on the effect that the comprehensive training in Classical Studies had on the life of this great German poet:

Schiller sagte einst in einer schwermütigen Stimmung: ‘Wenn man auch nur gelebt hätte, um den dreiundzwanzigsten Gesang der Ilias zu lesen, so könnte man sich nicht über sein Dasein beschweren.’ (Schiller once said [to me] in a melancholic mood: ‘If one had only lived to read the 23<sup>rd</sup> stanza of the Iliad, one could not complain about one’s existence.’ [Wolzogen 1882: 276]).

Friedrich Gottlieb Welcker (1784-1868), the first professor of Greek literature and Archaeology at a German university, who had been private tutor in the family of Wilhelm von Humboldt from 1806 to 1807 at Rome, referring to Schiller’s enthusiastic admiration for the Iliad, asserts that Schiller “ware ohne die Alten nicht Schiller gewesen” (‘would not have been Schiller without the Ancients’ [Welcker 1861: 4]). He also quotes Friedrich Gottlieb Klopstock’s (1724-1803) statement made when at an advanced age: “Die Alten waren und sind meine Lehrer.” (‘The Ancients were and are my teachers.’[3]).

The extraordinary influence of Classical Studies was by no means restricted to the special group of creative writers. Walter Jens (b. 1923), appointed Professor of Classical Philology at Tübingen in 1950, refers in 1974 to an amazing development (1974:69): “... the utopia of the 16<sup>th</sup> century, a world of Latin-speaking dentists, Homer-reading

lawyers and Sophocles-quoting merchants, had become a reality around 1850.” This truly extraordinary achievement was obviously not to last. Classical University Studies and the teaching of Latin and Greek at the high school level did not fare, during the subsequent century, as well as Classicists had hoped it would, especially “... when one considers that well into our century education and culture were identical with mastery of classical humanities” (68). Jens continues with a gloomy verdict on the 1950s and beyond:

... how much obsolete baggage is still being purveyed in the schools of the Federal Republic [of Germany], handed on from class to class, only because that is what tradition and the curriculum demands! Generations of pupils bored by Ovid’s *Metamorphoses*, Latin lessons started with Caesar, Greek lessons with Xenophon (77).

The meaning, he asserts, “matters not ... for what is at stake is the gerund” in Latin texts, “and the pupils are practicing the verbs ending in -mi” (77), when dealing with Greek literature.

For some high schools this is of course too dismal an assessment, but a less gloomy verdict would still seem to be the exception rather than the rule. The beginning of that unfortunate development has to be traced back to the second half of the 19<sup>th</sup> century when most of the leading scholars of Classical Studies and Comparative Linguistics were either incapable or unwilling to look critically and objectively into the long-range development of their own specialized discipline and that of their potential partner’s. Admittedly, there must have been a multitude of reasons behind those extensive adverse changes, many of them extremely complex and some entirely beyond the control of single individuals. But it is hard to believe that changes of this magnitude could not have been influenced for the better, had there been in place a functioning cooperation of all responsible forces.

Among the classical scholars who contributed most significantly to the redefinition and revitalization of the field in Germany during the outgoing 18<sup>th</sup> and beginning 19<sup>th</sup> centuries, special praise is due to Friedrich August Wolf (1759-1824). In his *Darstellung der Altertumswissenschaft nach Begriff, Umfang, Zweck und Wert* (*Portrayal of Classical Studies according to Its Concept, Range, Purpose and Value*)

(his term *Alterthums-Wissenschaft* may also be translated as: *Archaeology*), first published in 1807, he emphasized that the main objective of *Alterthums-Wissenschaft* “ist ... kein anderes als die Kenntniss der alterthümlichen Menschheit selbst” (‘is ... nothing else but [gaining] knowledge of ancient mankind itself’ [1986: 124-125]). Such knowledge would be obtained “aus der durch das Studium der alten Ueberreste bedingten Beobachtung einer organisch entwickelten bedeutungsvollen National-Bildung” (‘from the observation, based on the study of the ancient remnants, of an organically developed, meaningful national education’ [125]). Wolf’s definition of “Alterthums-Wissenschaft”, for which he also uses the term “Philology”, is, as we can see, rather comprehensive. As a matter of fact, his list comprises 24 sections of philology (143-145). Apart from all aspects of language and literature, he also wants included, among other subjects, history, geography, mythology, archaeology, art, and numismatics. While his predecessors dealt more or less exclusively with the investigation of grammar as well as textual and literary criticism, Wolf would aim at the investigation of human activities in their entirety. It was, in the words of Ada Hentschke (b. 1942), Wolf’s most original achievement,

das neue Menschenbild zum Bildungsziel und Leitprinzip für die Philologie zu erheben: Die Philologie übernimmt wiederum die Rolle als führende Bildungsmacht und dies zu einer Zeit, als sie sie endgültig verloren zu haben schien (to elevate the new image of humanity to become the educational objective and guiding principle of philology: Philology assumes again the role as leading educational force, and this at a time, when it appeared to have lost that role for good [1972:82]).

Of Wolf’s contemporaries and immediate successors some were convinced of the need to continue along those lines – for instance, August Boeckh (1785-1864). For Boeckh, the true objective of philology is “das Erkennen des vom menschlichen Geist Producirten” (‘to recognize what has been produced by the human intellect’ [1966: 10]). “Der adäquateste Ausdruck der Erkenntnis ist die Sprache.” (‘The most adequate expression of recognition is the language’ [11]), which mandates the meticulous investigation of language, not as an object in itself, but as an essential tool in the pursuit of higher objectives. One of his younger colleagues was Karl Otfried Müller (1797-

1840), whom Sandys describes as “the most brilliant and versatile, and the most widely influential” (1967: 213). He was a prolific writer and gained early recognition even by scholars from abroad. Several of his works appeared in English translations (cf., e.g., Müller 1830).

Others, such as Gottfried Hermann (1772-1848), restricted their attention primarily to the study of language. Hermann led a group of scholars, for whom a thorough investigation of the language constituted the first and foremost precondition for accomplishing the ultimate objective of philology: comprehension of the writings of classical antiquity (cf. Bursian 1880: 175). That the two approaches are complementary by their very nature, is quite apparent to us and was most likely not overlooked by those two parties either. Nevertheless, the contenders pursued their specialized research rather independently, perhaps not because of plain stubbornness, but because they were convinced of the predominance of their particular subject area. The *avoidable* damage for both sides was considerable.

During the time of Wolf, Hermann, and Boeckh, enormously important changes had occurred outside the field of Classical Studies, changes bound to cause the restructuring of language studies in general and of the study of Latin and Greek in particular.

As attentive observers from a safe distance in time, we can hardly refrain from wondering about the almost deafening silence that prevailed in Classical Studies circles during the first decades following the emergence of Comparative and Historical Language Studies and the rather hostile attitude which thereafter continued to be displayed for quite some time.

Friedrich von Schlegel (1772-1829) had alerted the scholarly world in 1808, with the publication of his amazingly influential work *Ueber die Sprache und Weisheit der Indier (On the Language and Wisdom of the Indians)*, that a new era in language study was about to begin. The following programmatic statement amounted to an urgent call for immediate groundbreaking action:

Jener entscheidende Punkt aber, der hier alles aufhellen wird, ist die innere Structur der Sprachen oder die vergleichende Grammatik, welche uns ganz neue Aufschlüsse über die Genealogie der Sprachen auf ähnliche Weise geben wird, wie die vergleichende Anatomie über die höhere Naturgeschichte Licht verbreitet hat. (But that decisive point which here will throw light on everything is the inner structure of the languages or the comparative grammar that will provide us with entirely new insights on the genealogy of the languages in a similar way as the comparative anatomy has spread light on the higher natural science [1808: 28]).

Franz Bopp (1791-1867) seemed to have been waiting for just such a cue to start his revolutionary work. In 1816 his treatise *Über das Conjugationssystem der Sanskritsprache (On the Conjugational System of the Sanskrit Language)* appeared, 17 years later the first volume of his *Vergleichende Grammatik (Comparative Grammar)*. During the years in between a large number of studies on language comparison by other scholars, but also by Bopp himself, presented a fairly comprehensive picture of what the new science was all about and what it could be expected to achieve. A favorable article in the *London Magazine* “veranlasste Bopp zu einer englischen Bearbeitung seines Erstlingswerkes” (‘induced Bopp to arrange for an English edition of his first work’ [Lefmann 68]).

Classical Studies was suddenly put on notice to take stock of what had been accomplished or was about to be accomplished *intra muros philologiae classicae – et extra (inside and outside Classical Philology)*. The results of this soul-searching endeavor are difficult to assess in detail, since written accounts on this topic are scarce. But the absence of ample written documents does not preclude to assume the existence of lively discussions at the time among classical scholars. In any case, it seems safe to conclude that the general consensus at the initial stage had been: There is no need for us to respond. The matter is not important enough for us to be concerned and take action.

When the first reactions appeared in print, a largely negative tone prevailed, signaling unmistakably that Classical Philology by and large had no use for the new approach. The time-honored practices of the proven experts in Latin and Greek were considered vastly superior to what the promise of a young, unproven procedure *might* deliver. And what during the first few years had been produced was not exactly convincing either. Gottfried Hermann, for instance, pronounced (“Prefatio” to *Acta*

*Societatis Graecae*, XIII) in 1836: "... ex paucis non satis cognitarum linguarum vestigiis quae Graecorum et Latinorum verborum vis sit explanare conantur." ('They undertake to explain from a few remnants of not sufficiently understood languages what the essence of Greek and Latin words [verbs?] might be' (cf. Freund, 1874.I: 15), a statement, ridiculed by K. O. Müller (cf. *ibid.*). Other, equally dismissive evaluations could be cited.

In a different category belongs a group of classical scholars who simply disregarded or failed to examine seriously the new accomplishments. Georg Curtius (1820-1885), one of the few scholars trained in Classical Studies who wholeheartedly embraced Comparative Linguistics (for greater details about his work see Jankowsky 1986) without losing sight of what was valid in the old established approach (cf., e.g., Clemm 1872: 24-25), on the one hand has ample praise for Philipp Karl Buttmann (1764-1829):

Kein gleichzeitiger Philolog hat die Schäden der grammatischen Tradition so durchschaut wie er und die Behandlung der griechischen Sprache als eines naturwüchsigen Ganzen so vielseitig gefördert. (No contemporary philologist has figured out the damages of the grammatical tradition like he has and advanced the treatment of the Greek language as a naturally grown entity in so many ways [1858: 18]).

His point of reference is Buttmann's *Lexilogus* of 1836. He continues, on the other hand, reproachingly: "Unleugbar hat er sich dabei auch in viele Irrthümer verstrickt." ('In this he also has indisputably become entangled in numerous errors' (*ibid.*)).

Hier rächte es sich, dass Buttmann noch im Jahre 1825, also 6 Jahre nach der ersten ... Auflage von Grimm's Grammatik, 9 Jahre nach Bopp's Conjugationssystem aus diesen Epoche machenden Werken nichts gelernt hatte. (Here Buttmann had to face the negative consequences that even in 1825, that is, 6 years after the first ... edition of Grimm's grammar, 9 years after Bopp's *Conjugationssystem*, he had learned nothing from those epoch-making works" [19]).

Curtius' verdict is echoed, almost verbatim, in a statement by Benedikt Mette, high school teacher of Latin in Brilon (1873: 4, note 1). His entire article on "Die vergleichende Sprachforschung in ihrer Bedeutung für die klassische Philologie"

(‘Comparative Linguistics in Its Significance for Classical Philology’) serves to show that the discussion on the significance of the new approach was not restricted to the theoretical sphere, but was put to practical use on the high school level.

Another pedagogue, Julius Lattmann, director of a high school in Clausthal, reports that at various Philological Congresses extensive discussions were held on the “von der Wissenschaft längst verlangte Reform der Unterrichtsmethode” (‘reform of the instructional method that has long been demanded by the academic discipline’ [Lattmann 1871: 2]). According to him, the following resolution was finally passed in 1867 by majority vote: “Die Schule ist verpflichtet, für den griechischen Unterricht von den Resultaten der vergleichenden Sprachforschung ... Gebrauch zu machen.” (‘The school is obligated to incorporate the results of comparative linguistics ... in the teaching of Greek’ [ibid.]).

The number of purely appreciative assessments of Comparative Philology began to grow slowly but steadily starting with the 1850s. It should be no surprise that we find voices of approval in either camp, i.e., followers of Hermann constituting, in the words of John Edwin Sandys (1844-1922), the “*grammatical and critical school*” as well as of those of Boeckh, referred to in the same source as “*historical and antiquarian school*” (1967.III: 89). We shall look at some representative selections after turning to Friedrich Max Müller (1823-1900) as an example of unrestricted endorsement from outside Germany. This German-born Indo-Europeanist had studied Sanskrit at Leipzig under Hermann Brockhaus (1806-1877), Latin with Gottfried Hermann, and also attended lectures by Franz Bopp in Berlin. In 1847 he moved to England, where he introduced Comparative Linguistics and popularized it there and in numerous other countries like nobody else before and after. In his *Lectures on the Science of Language*, presented in 1861 at the Royal Institution in London, published in numerous editions and translated into many languages, Müller stresses the independence, and implicitly the mutual interdependence, of the two approaches. He also argues forcefully for the need to study any type of natural language since all languages are of equal value:

It will not be difficult to show that, although the science of language owes much to the classical scholar and though in return it has proved of great use to him, yet comparative philology has really nothing whatsoever in common with philology in

the usual meaning of the word. Philology, whether classical or oriental, whether treating ... of cultivated or barbarous languages, is an historical science. Language is here simply treated as a means. The classical scholar uses Latin and Greek ... as a key to an understanding of the literary monuments which by-gone ages have bequeathed on us. ... In comparative philology the case is totally different. In the science of language, languages are not treated as a means; language itself becomes the sole object of scientific enquiry. ... We do not want to know languages, we want to know language (1866:32-33). ... Nor is the language of Homer of greater interest, in the scientific treatment of human speech, than the dialect of the Hottentots (81).

It should be obvious from the foregoing that difficult steps of adjustment were required and that it could be expected to take time for both sides to recognize the advantages of even partial cooperation and anticipate the potential damages if cooperation was rejected. Christopher Stray's comment of 1998 is to the point: "Much of the scholarly opposition to the rise of comparative philology can be ascribed to its implicit demotion of Greek and Latin in favour of Sanskrit" (1998: 108).

Ludwig Lange, Professor of Classical Philology in Prague, gives an account of how by 1855 the world had changed for his field of study. There are now numerous other philologies, Germanic launched by Jacob Grimm (1785-1863), Romance by Friedrich Diez (1794-1876), and Slavic by Franz Miklosich (1813-1891). Many other philologies, he is aware, will undoubtedly follow:

... keinem Volke ist es zu verdenken, dass es auf dem allen Völkern gemeinsamen Wege zur wahren Humanität vorzugsweise gern in die Schätze seiner eigenen Vergangenheit zurück greift, und das, was Vaterland, Muttersprache und Geschichte ihm theuer macht, in der Humanität zu bewahren strebt. (... no people can be blamed for their preference – on the way to true humanity, common to all people – to draw on the treasures of their own past and strive to preserve in the humanity what fatherland, mother tongue and history make dear to them [1855: 10]).

He tries to make the best of the new powerful forces having entered the scene, by calling those new philologies "jüngere Schwestern" ('younger sisters'), "weil sie als Nachahmungen der klassischen Philologie erscheinen" ('because they appear as imitations of Classical Philology' [9]), and insists that Classical Philology "wird ... nicht bloss die Stelle der ältesten Schwester einnehmen, sondern auch ihrem Werthe nach die

erste sein und bleiben” (will ... not merely assume the position of the oldest sister, but also, according to its value, be and remain the first among them’[9]). But he realizes nevertheless:

Es ist z. B. klar, dass die klassische Philologie die Prinzipien für die wissenschaftliche Behandlung der griechischen und lateinischen Sprache der allgemeinen Sprachwissenschaft entnehmen muss. (It is, for instance, clear that Classical Philology has to take over from the general linguistic science the principles for the scientific treatment of the Greek and Latin language [8]).

By the 1850s, most classical philologists are ready to embrace whatever help Comparative Linguistics can provide to facilitate and improve their language analysis. Some doubts and misgivings still linger on. In the words of Conrad Bursian: “Ja es fehlte auch nicht an lautem Widerspruch gegen die Methode und die Resultate der jungen Wissenschaft” (‘Sure, there was no shortage of loud protest against the method and the results of the young science’ [Bursian 1883: 972]), and he cites as one example Ludwig Ross’ (1806-1859) 97-page treatise on *Italiker und Gräken: Sprachen die Römer Sanskrit oder Griechisch? (Italics and Greeks: Did the Romans Speak Sanskrit of Greek?)*, followed a year later by a 2nd edition enlarged to 258 pages, where protest is dished out “mit mehr Humor als Sachkunde” (‘with more humor than specific knowledge’ [ibid.]). Bursian also provides an interesting afterthought:

Es wäre eine entschiedene Ungerechtigkeit, wenn man die Schuld an diesem Verhältnis ausschliesslich den Vertretern der classischen Philologie, der Beschränktheit ihres Gesichtskreises, ihrem zähen Festhalten am gewohnten Schlendrian und ihrer hochmüthigen Geringschätzung andersartiger Bestrebungen zur Last legen wollte. (It would be a definite injustice, if one would assign the blame for this situation entirely to the representatives of Classical Philology, to the narrowness of their scope of view, to their tenacious adherence to the habitual jog trot and their arrogant contemptuousness of different aspirations [Bursian 1883: 972]).

He subsequently points out that the initial endeavors of the comparativists were prone to raise in the minds of “Philologen strikter Observanz Bedenken und Misstrauen gegen die Solidität der neuen Gründung” (‘philologists of strict observance concerns and suspicion as to the solidity of the new beginnings’), because of their “anfangs noch ziemlich unsichere[n] und tastende[n] Methode” (‘initially still rather insecure and

groping method' [ibid.]). But he acknowledges that by the time of his writing, in 1883, even the Classical scholars had joined the general chorus of acceptance of Comparative Linguistics. The trend now was irreversibly set. In 1893 the prominent classical scholar Ulrich von Wilamowitz-Moellendorff (1848-1931) accurately captures the main features in the ongoing development. Mentioning the excellent work of Philipp Buttmann (1764-1829) on Greek accentuation and "die Vereinigung logischer Strenge und echt griechischem Sprachgefühls" ('the combination of logical rigor and of genuine flair for the Greek language' [1893: 470]) that [Gottfried] Hermann possessed, he reminds his readers that both achievements were on record, "ehe es eine vergleichende Sprachwissenschaft gab" ('before there was a Comparative Linguistics' [ibid.]), yet goes on to admit:

Aber es lässt sich doch nicht bestreiten, dass die Heranziehung des in seiner Fülle so viel durchsichtigeren Sanskrit samt der Einsicht in die Verwandtschaft der indoeuropäischen Sprachen wenigstens Laut- und Formenlehre von Grund aus umgestaltet hat. Die Sprödigkeit und das Misstrauen auf der einen, der Ueberschwang an Zuversichtlichkeit und Versprechungen auf der anderen Seite sind schliesslich durch die versöhnende Kraft der Wahrheit überwunden. (But it can, nevertheless, not be disputed that utilizing Sanskrit, in its abundance that much more translucent, together with the insight into the relationship of the Indo-European languages, has radically reshaped at least the phonology and morphology. The reserve and the mistrust on the one side and the exuberance in matters of self-confidence and promises on the other side have finally been overcome by the reconciling power of the truth [470]).

Georg Curtius more than anyone else at his time had proven, through his teaching and research, that Classical Studies and Comparative Linguistics can indeed, to their mutual benefit, work closely together and produce results not achievable if the two sides go their separate ways. He was trained in Bonn by the Classicist Friedrich Ritschl (1806-1877), the founder of Old Indic Philology August Wilhelm von Schlegel (1767-1845), and Schlegel's associate Christian Lassen (1800-1876), the founder of Indian Classical Studies, whom Schlegel had introduced to Indic Studies. During his two years at Berlin he took courses with Franz Bopp, since 1821 – through Wilhelm von

Humboldt's intervention – Professor of Oriental Literature and General Philology, and with the Classical Philologist August Boeckh.

In addition to implementing his theoretical framework through his many publications, Curtius discussed his position in a number of specific papers. The earliest, *Die Sprachvergleichung in ihrem Verhältnis zur classischen Philologie (Language Comparison in Its Relationship to Classical Philology)*, first published in 1845, offered a description of the methods employed and the results achieved by historical language comparison and their significance for Classical Studies. He also made a passionate plea for the utilization of the riches of Classical literature in his inaugural address at the University of Prague in 1849:

Durch viele Jahrhunderte hindurch sind die Werke der Griechen und Römer, ihre Sprachen wie ihre Schriften, das Hauptbildungsmittel der Jugend. (Throughout many centuries, the works of the Greek and Romans, their languages as well as their writings, have been the main resource for the education of the youth' [Curtius 1849: 91]).

Curtius, not surprisingly, also reaped occasional harsh criticism. Most notable is the attack by Karl Wilhelm Krüger (1796-1874), who was enraged that his own *Griechische Sprachlehre für Schulen (Greek Grammar for Schools)* of 1843 could not gain acceptance by the school systems in German lands because of the predominant position that the grammar of Curtius had won and easily maintained for many decades. Krüger, according to John Edwin Sandys, “declined to recognise in his Grammar any of the results of Comparative Philology, and he even attacked the principles followed in the Greek Grammar of G. Curtius (1852) ... the bitterness and violence of which can only be excused by the author's many misfortunes”(1967.III: 119). Ernst Windisch (1844-1918), in his obituary note on Curtius, just briefly mentions Krüger's aggressive criticism:

Wer von der indogermanischen Sprachwissenschaft nichts wusste, der konnte auch den Werth dieses Buches nicht erkennen. Die unwürdigen Angriffe von K. W. Krüger können wir heute auf sich beruhen lassen. (He who did not know anything about Indo-European Philology, certainly could not recognize the value of this book

[Curtius' *Greek Grammar*]. The derogatory attacks by K. W. Krüger we can altogether disregard today [quoted after Sebeok 1966 I: 353]).

Before starting his academic career, Curtius had taught Latin and Greek from 1845 to 1848 at a high school in Dresden. It was during this time that he thought about writing a Greek grammar which would incorporate the insights of Comparative Linguistics into the Greek language teaching methodology at the high school level. After gaining his *venia legendi* – prerequisite for teaching at the university level – he obtained a professorship in Classical Linguistics at the University of Prague in 1849. His work on the Greek grammar was completed there. First published in 1852, the book was immediately adopted by the Austrian high school system and not much later also by schools in several German provinces. Its success was amazing. In 1884, a year before the author's death, the grammar had gone through 16 editions, and there was no end in sight. The latest of the revised editions, prepared by a succession of scholars, that I could track down was number 38, issued in 1962.

Curtius did not deliver Classical Philology to Comparative Linguistics. He made, instead, by his consistent endeavors, Comparative Linguistics palatable to the Classical scholar. In 1862, when the worst of the struggle was over, he could rightly assert:

Die Wichtigkeit der vergleichenden Sprachforschung für die Philologie ... ist nach einem lang anhaltendem Kampf mit eingerosteten Gewohnheiten und hartnäckigen Vorurtheilen in neuester Zeit mehr und mehr in das Bewusstsein der Philologen übergegangen. Wenigstens dem Princip nach möchte diese Wichtigkeit von keiner Seite mehr ernsthaft bestritten werden. (The importance of Comparative Linguistics for Philology ... has, after a long-lasting fight against inveterate practices and pertinacious prejudices, in most recent times more and more gained entrance into the consciousness of the philologists. At least on principle no side would now want to seriously contest this importance any more [1862: 16]).

Does this imply that what was missed during the years of excessive specialization could now be recouped and that damages incurred by non-action or misguided action could now be made undone, with the assurance that all future damages could be safely avoided? That is, of course, a rhetorical question which may be seriously asked only from a position of rather unrealistic wishful thinking.

What, then, was lost and what was gained? *Plenty*, and that on both counts and applying to both disciplines.

*Classical Studies*: Its reorientation, in large part put into motion by the findings of Comparative Linguistics – which mandated (1) that language analysis can and must be dramatically refined and (2) that the notion of Greek and Latin as uniquely superior to all other languages had to be replaced by the notion that all languages are created equal – was in itself potentially much more of a gain than a loss. Part 1 is generally implemented, and its value almost universally acknowledged. Here a significant loss occurred due to the delay and the slowness in adopting the new procedure. It negatively affected whole generations of high school and university students. Part 2, however, suffers to this very day from something like a triple jeopardy. First, Classical Scholars would have to devise a national philology for Latin and Classical Greek, using as models the successfully created, now beautifully flourishing modern philologies. However, those models have something that Latin and Classical Greek certainly do no more have: living speech communities. That leads us to the second problem. The vast treasure of knowledge that owes its existence to ancient Greek and Latin humanity can continue to be accessed and easily be restored, it is true, now even much better than ever before. But this does not erase the vexing problem that still needs to be tackled and solved: for what current speech community can the singular achievements of the world of ancient Greek and Rome be demonstrated as currently relevant, as having even today a significant impact on the life of the highly educated, and perhaps even for the average citizens? Modern Greeks and Italians will surely be proud of their ancestors' unique accomplishments, but that feeling alone is not likely to have a decisive impact on their everyday life.

The third problem is tied to the position of unprecedented predominance which Classical Philology had reached on the university and high school levels in central Europe by the 1850s and its steady decline ever since. A realistic assessment would in all likelihood arrive at the conclusion that the decline could not have been averted, but that its extent might have been drastically curtailed, and one may rightfully, though somewhat optimistically, believe that it still can. Comparative Linguistics, by the creation of national philologies, has shown the way, how the cultural and intellectual

accomplishments of the past can become a valuable, in some manner even essential part of a nation's heritage. The revolutionary new approach has also provided the incentive for a particular nation to value the historical achievements of other nations, especially in case of shared historical developments. Western cultures are built on foundations for which Classical Greek and Roman antiquity furnished the most essential components. Many of these components can become part of the treasured historical wealth of a particular nation, provided the relevance of those components for contemporary life is convincingly established and effectively propagated. On this basis, Classical Scholarship enjoyed its peak development in Germany during the 1850s. Established values, however, may lose – and, as we saw, have lost – their relevance over time. The failure to put to work timely remedies is bound to trigger inescapable, but foreseeable consequences. This was true in the 1800s and 1900s, as it is true today. Classical Studies can be restored even in our time to some of its former greatness, but – quoting Walter Jens (81): “The possibilities are great, the hope that they might be put to use is slight.”

*Comparative Linguistics:* Its emergence in the early 19<sup>th</sup> century constitutes unquestionably the century's most important event in language analysis. The scholars instrumental in launching Comparative Linguistics adapted their methodology, inherited from their classical teachers, in accordance with their specific objectives: (1) to define the genetic relationship of languages assumed to have a common ancestor, by analyzing their grammatical structure as well as their lexicon; (2) to determine the grammatical and lexical components shared by all languages investigated and accumulate data on language universals. The investigation at the outset was restricted to Indo-European languages. It was soon expanded with equal success to other individual languages and language groups, potentially including – as general linguistics – each and every natural language and thus becoming effectively a universal tool.

Comparative Linguistics derived beneficial strategies from Classical Studies over and above the mentioned initial methodological guidelines. For both disciplines, language analysis is an aim in itself, but also a means to another, more important objective: to comprehend the cultural and intellectual life of the people who speak that particular language. We have seen how magnificently Classical Studies succeeded in

securing for Greek and Latin a volume of instruction at, for instance, German high schools and universities which had never been reached before. Here too, Comparative Linguists should have applied the immensely successful model of their Classical colleagues in their own arena, with the good likelihood that they could have equaled, perhaps even surpassed what the Classicists had achieved.

That did not happen. To my knowledge, no serious attempt has ever been made in any of the modern philologies to channel the secured specialized knowledge on language into the educational system. Scholars are used to primarily present their research to other scholars, and their publications might occasionally also be read by a small number of inquisitive people among the general public. But this could do little to offset the negative effect of what was left undone: To substantially reorientate language education in the school system, especially on the high school level, in a way that would do full justice to the enormous influence which language exerts on practically every aspect of our lives.

Jacob Grimm, in an introductory section of his *Deutsche Grammatik (Germanic Grammar)*, part 1, of 1819, had cautioned against dealing in schools with the German language grammatically, because so much could easily go awry. He insisted that by the wrong type of grammatical instruction “die freie entfaltung des sprachvermögens in den kindern gestört ... werde” (‘the free unfolding of the faculty of speech in the children would be interfered with’ [Grimm 1966: 30]). In his opinion, there is “keine Grammatik der einheimischen sprache für schulen und hausbedarf” (‘no grammar of the native tongue for schools and domestic use’). Each German,

der sein deutsch schlecht und recht weiss, d. h. ungelehrt, darf sich ... eine selbsteigene, lebendige grammatik nennen und kühnlich alle sprachmeisterregeln fahren lassen (‘who knows his German pure and simple, that is, untaught, may call himself ... a self-owned living grammar and may boldly dispense with all schoolmaster rules altogether [31]).

The only feasible study of grammar must be “ein streng wissenschaftliches und zwar der verschiedenen richtung nach, entweder ein philosophisches, kritisches oder historisches” (‘a strictly scientific one, and this, according to the different orientation, either a philosophical, critical, or historical study’[(31)).

We can agree with Grimm's differentiation between the natural growth of the mother tongue in a child and the scientific study of historical language development, the pursuit of which will have no direct impact on the children's advancement in language proficiency.

But what is at stake is another type of language knowledge which ought to have been placed on the language teaching agenda more than a hundred years ago: How is the faculty of language, as the most important criterion that separates man from all other specimens of creation, being used by the native speakers to perceive and process what is encountered by us in the world at large at any given moment of our lives? What are some of the most striking differences from one language to another as far as this perception and processing is concerned?

Comparative Linguistics and its various most modern branches have discovered a multitude of facts which, however, to a great extent, unfortunately stay within the research community, because there was not – and there is not – any overarching design to prepare those facts for widest possible dissemination. Feeding those facts in an appropriate way into every level of education would have been a worthy modern counterpart to the predominance of Classical Studies in the educational system around the 1850s.

The practitioners of Comparative Linguistics, apart from prudently discarding a great deal of unproductive and aberrant procedures, learned so much from their colleagues in the Classical Studies camp, but they failed to learn one most particular lesson: to recreate for their own field of research the greatest accomplishment of their distinguished predecessors. That great feat could – and undoubtedly would – have been the most precious jewel in their jewel-studded crown.

## Abstract

Research carried out over the past two decades has shown there to be a robust relationship between the mora and prosody in Modern Japanese. If the prosodic unit of the foot is taken to consist of two moras, a number of phonological and morphological structures may be generalized, including compound and loanword clipping, hypocoristic formation, accentuation patterns in compounds, reduplication in mimetics, and jazz argot. Also proposed, although not as yet independently evaluated, has been a prosodic size rule governing the well-known allomorphic phenomenon of rendaku, by which non-initial elements in compounds may undergo initial voicing under certain conditions. It is claimed that the prosodic size rule flags a native Japanese noun as being rendaku immune, a condition for which no empirical verification has hitherto existed. In this paper the author will show that, although slight modifications taking account of certain diachronic issues of obsolescence are necessary, a prosodic size rule for flagging rendaku immunity is indeed a reality and that rendaku also may now be added to the list of phonological and morphological structures generalised by the relationship between the mora and prosody.

**Keywords:** rendaku, sequential voicing, prosody, mora, Japanese phonology, compounding

## 1. Rendaku

In Japanese, non-initial elements in compounds may undergo initial voicing under certain conditions, an allomorphy known as ‘rendaku’ or sequential voicing. The readily apparent irregularities exhibited by rendaku have meant it has undergone extensive research – indeed, descriptions or analyses of rendaku form some of the earliest extant research on the Japanese language in both Japanese (Motoori 1790-1822) and English (Lyman 1894). While the volume of ink expended on the subject has been too great to allow all previous work to be reviewed here (see, however, Suzuki 2005 for a thoroughgoing bibliography), what is worthy of note is that a literature devoted to the origins of rendaku and to describing the phenomenon from a diachronic perspective (Yamada 1904; Ogura 1910; Okumura 1952; Nakagawa 1966; Vance 1982, *inter alia*) has gradually – in line with the North American academic *zeitgeist* – come to be overtaken by a literature seeking to explain the causes and apparent irregularities of rendaku within synchronic theoretical frameworks (Itô & Mester 1986; Itô, Mester & Padgett 1995; Takayama 1999; Fukuzawa & Kitahara 2001; Rosen 2001; Irwin 2005, etc.).

A brief exposition of rendaku will show that in many cases what were initially considered to be irregularities have turned out not to be so at all. The basic phonological condition under which rendaku may occur is that the non-initial element in a compound begin with a voiceless obstruent (*k t s h*)<sup>1</sup> as in:

	fake		[raccoon dog soup]			‘fake [raccoon dog soup]’
b.	[ <i>nise</i> + <i>tanuki</i> ] [fake raccoon dog]	+	<i>siru</i> soup	>	<i>nisedanukiziru</i>	‘[fake raccoon dog] soup’

Here, rendaku can only be triggered when an element is on the right branch of a constituent tree, with rendaku blocked by Lyman’s Law for the *tanuki* element of (4a).<sup>iv</sup>

Japanese vocabulary is generally divided into three main strata: native vocabulary (*wago*: henceforth NJ), a Sino-Japanese stratum (*kango* or *jiongo*: henceforth SJ), and foreign vocabulary (*gairaigo* or *shakuyōgo*: henceforth FJ).<sup>v</sup> Providing the non-initial element is a voiceless obstruent, and bearing in mind the constraints outlined in (2-4) above, rendaku ought to occur in any of the three strata. In reality, however, the phenomenon of rendaku cuts across the vocabulary strata to hugely varying degrees: it occurs with only exceptional rarity in FJ (Vance 1987:141; Takayama 2005:178-181); with a frequency of approximately 10-20% in SJ (cf. (1c) where the second element is SJ), depending on whether the SJ element is a binom (Vance 1996:25, App. 2) or a monom (Irwin 2005:140-145); and at a level of around 87% in NJ (Vance 1996:30-34).

Finally, rendaku exhibits differing degrees of irregularity depending on word class: its frequency in inflected compounds (compounds which are themselves verbs or adjectives, regardless of the parts of speech to which their elements belong) is low when both elements are verbs (5a), but much higher when the initial element is a noun (5b), or one (5c) or both (5d) elements is an adjective.

(5) a.	<i>ki</i> wearing	+	<i>kaeru</i> change	>	<i>kigaeru</i> ‘change clothes’
b.	<i>kuti</i> mouth	+	<i>hasiru</i> run	>	<i>kutibasiru</i> ‘blurt out, blab’
c.	<i>hara</i> belly	+	<i>kuroi</i> black	>	<i>haraguroi</i> ‘scheming, malicious’
d.	<i>usu</i> being thin	+	<i>kurai</i> dark	>	<i>usugurai</i> ‘dim, gloomy’

The voicing rates by vocabulary stratum cited in the previous paragraph apply to uninflected compounds (compounds which are nouns) and these may include deverbal noun elements (6a), deadjectival noun elements (6b), and ‘pure’ uninflected noun elements (1-2) in any combination. These different types of uninflected noun compound also exhibit differing levels of rendaku (Vance 2005).

(6) a.	<i>naka</i> inside	+	<i>tati</i> standing	>	<i>nakadati</i> ‘mediation’
b.	<i>yasu</i> being cheap	+	<i>sake</i> saké, alcohol	>	<i>yasuzake</i> ‘rotgut’

Additionally, it should be noted that in Japanese a compound string can consist of an infinite number of elements and *rendaku* may operate in any or all of the non-initial elements (cf. (4b)). In this paper, however, I will restrict my definition of ‘noun’ to those which are not morphologically derived and my definition of ‘noun compound’ to a compound which is itself not morphologically derived and is composed of two such noun elements: examples (1-3) above are typical. Further, since to which vocabulary stratum the initial element in a noun compound belongs has no bearing on the triggering of *rendaku* (Ohno 2000:155), the term ‘NJ noun compound’ shall henceforth refer to the stratal provenance of the final element. Thus, both the SJ-NJ compound (1b) and the FJ-NJ compound (2d) I label NJ noun compounds.

## 2. Rendaku Predilection and Rendaku Immunity

Despite the constraints described in (1-4), cases where *rendaku* fails to be triggered in sequentially voiceable NJ noun compounds remain numerous, something which has been remarked upon since the beginning of the literature and has doubtless been a major contributory factor towards the proliferation of research into the phenomenon.

The vast majority of sequentially voiceable NJ nouns which appear as a second element in a noun compound – in numbers sufficient to make a statistical analysis significant – exhibit predilectory behaviour. In other words, although *rendaku* is sometimes triggered and sometimes not, a clear tendency towards or away from *rendaku* is apparent. Into which camp a sequentially voiceable NJ noun falls may be described by use of the terms ‘*rendaku* lover’ and ‘*rendaku* hater’. Consider examples (7-8) below, where all initial elements are bimoraic NJ nouns free of voiced obstruents, where the first element in (a) has the same accentual pattern<sup>vi</sup> as the first element in (b), and where the second element in (a) is semantically parallel to the second element in (b):

(7)	a.	<i>tani</i> valley	+	<i>soko</i> bottom	>	<i>tanisoko</i> ‘valley floor’
	b.	<i>kawa</i> river	+	<i>soko</i> bottom	>	<i>kawazoko</i> ‘riverbed’
(8)	a.	<i>asi</i> leg	+	<i>kuse</i> habit	>	<i>asikuse</i> ‘gait’
	b.	<i>kuti</i> mouth	+	<i>kuse</i> habit	>	<i>kutiguse</i> ‘pet saying’

The second element (7) *soko* ‘bottom’ is a *rendaku* lover while the second element (8) *kuse* ‘habit’ a *rendaku* hater: the *rendaku* behaviour evinced in (7a) and (8b) is thus unusual for these two nouns.

Rosen (2001:40) defines *rendaku* lovers as exhibiting *rendaku* in 66% or more of compounds where both elements are bimoraic<sup>vii</sup> and *rendaku* haters as exhibiting *rendaku* in fewer than 33% of such compounds, stating further that the former are considerably more frequent than the latter. Moreover, he claims there are only two

nouns, *kawa* ‘skin’ and *hara* ‘field’, which appear to be neither haters nor lovers, since the proportion of compounds in which they voice lies in the middle tertile. This ‘apparent tendency for a noun to either strongly prefer to voice, or else to resist voicing, with almost no nouns occupying a middle ground between the two tendencies’ (ibid.), if schematized, represents the logistic curve (S-curve) familiar from diffusionist hypotheses (Wolfram & Schilling-Estes 2003).

Employing the terms ‘native speaker reference’ and ‘native speaker memorization’, Ohno (2000) has argued that *rendaku* is dependent on speaker-internal references to semantically and/or phonetically parallel pre-existing compounds. Some of Ohno’s (ibid., 160) semantically parallel and phonetically parallel examples are shown in (9) and (10) respectively:

(9)	a.	<i>kuro</i>	+	<i>kami</i>	<i>kurokami</i>	‘black hair’
	b.	<i>shiro</i>	+	<i>kami</i>	* <i>shirokami</i>	‘white hair’
	c.	<i>hana</i>	+	<i>ti</i>	<i>hanazi</i>	‘nosebleed’
	d.	<i>mimi</i>	+	<i>ti</i>	* <i>mimizi</i>	‘earbleed’
(10)	a.	<i>waka</i>	+	<i>kusa</i>	<i>wakakusa</i>	‘young grass’
	b.	<i>aka</i>	+	<i>kusa</i>	* <i>akakusa</i>	‘red grass’

The second element in (9a), *kami* ‘hair’, is a *rendaku* lover but in this particular compound does not voice, while the second element in (9c), *ti* ‘blood’, is (it is claimed by Ohno) a *rendaku* hater which in this compound voices. When offered the nonce compounds (9bd) and asked how to read them in an experimental situation with no reference to the forms in (9ac), the majority of his native speaker subjects offered pronunciations which are predilectorily contrary to expectation but semantically parallel to existing compounds. Ohno found the same results applied to phonetically parallel forms such as (10) – *kusa* ‘grass’ is a *rendaku* hater – where the majority of subjects offered the pronunciations of the nonce word such as (10b) based on the phonetic similarity of forms such as (10a). It should be noted, however, that the compounds in (9ab) and (10) contain deadjectivals as their initial elements and it may be this factor rather than semantic parallelism which accounts for Ohno’s results. Similarly, while a brief perusal of any dictionary would seem to confirm Ohno’s claim that *ti* ‘blood’ is a *rendaku* hater, most of the compounds of which *ti* forms the second element also have deadjectivals as initial elements: noun compounds as defined in this paper are probably too few to make a judgement as to the predilection of *ti*. That said, while problems with Ohno’s theory clearly still remain, it should be borne in mind that no other convincing explanation for *rendaku* predilection and S-curve clustering has as yet been forthcoming.

Whether *rendaku* is a productive process which admits of lexical exceptions or simply the lexical property of specific words is, as Kubozono (2005:5) remarks, ‘difficult to assess’ because of its extreme productivity (1) on the one hand and the significant number of exceptions (7-8) on the other. Ultimately, he suggests (opus cit., 6-7) that work by Fukuda & Fukuda (1999) on Japanese native speaker children with specific language impairment (SLI) provides strong evidence for a lexical property in the case of common vocabulary but a productive process in the case of novel

compounds: ‘what remains unclear is the boundary... between “frequent” and “non-frequent” compounds’.

Predilection is not the only clearly identifiable behaviour to be exhibited by sequentially voiceable NJ nouns: some appear never to undergo rendaku, a fact which has been observed and, to varying degrees, catalogued by Vance (1979:86, 1980b:251), Martin (1987:114-115) and Rosen (2001:254-256) *inter alia*.<sup>viii</sup> Those cited as ‘rendaku immune’ in at least two of the aforementioned three studies are listed in (11):

(11)	<i>sio</i> tide	<i>tuti</i> earth, soil	<i>himo</i> <sup>ix</sup> cord, string
	<i>kase</i> shackle	<i>kasu</i> dregs, lees	<i>kemuri</i> smoke
	<i>saki</i> tip, point	<i>hime</i> princess	<i>tuyu</i> dew

It should be stressed that none of the above rendaku immune candidates has been proposed based on any empirical test or empirically verifiable criteria. While acknowledging that the overwhelming majority of the nouns in (11) do indeed appear to be rendaku immune, their inclusion is based on the fact that the compilers were unaware of any exceptions: significantly, only the first three nouns in (11), *sio*, *tuti* and *himo*, are listed by all three. Beginning in the following section, I shall show that an empirical test is in fact possible and, in the final section, revisit and revise the issue of rendaku immune nouns.

In closing this overview of rendaku immunity, one final observation should be made. It has frequently been noted that rendaku immune nouns possess homonyms (e.g. *tuti* ‘earth’ v. *tuti* ‘mallet’) which exhibit standard predilectory behaviour. What is more interesting is that the same circumstances exist with respect to polysemy. The immune *sio* ‘tide’ is probably polysemous with *sio* ‘salt’, but the latter is a rendaku lover; immune *saki* ‘tip, point’ is almost certainly polysemous with *saki* ‘cape, promontory’ and probably polysemous with *saki* ‘ahead’, but, once again, their rendaku behaviour differs. In the grey area between polysemy and homonymy (see discussion in Martin (1987:558)) we find the immune *tuyu* ‘dew’ contrasting with *tuyu* ‘rainy season’ and *tuyu* ‘broth’. It is interesting to speculate whether Japanese orthography, which unlike, say, English orthography, generally assigns different spellings not just to homonyms but also to polysemes (e.g. 潮 ‘tide’ v. 塩 ‘salt’) might historically have played a part in this behaviour in the minds of the literate.

### 3. Prosodic Size

Although the syllable is by no means irrelevant in Japanese morphology and phonology (Vance 1987:56-76, Kubozono 1999:42-55), Japanese is held to be a moraic language (Trubetzkoy 1969:8) with the mora (μ) ‘function[ing] as the unit of length... [and] the length of a phrase roughly proportional to the number of moras it contains’ (McCawley 1968:131). Its role in temporal regulation and phonological length and also as a unit of segmentation and perception is indisputable (Kubozono 1999:32-42).

Of critical importance in the context of this paper, however, is the relationship between the mora and prosody in Modern Japanese. If the prosodic unit of the foot is taken to consist of two moras (Poser 1990), then, as Kubozono (1999:40) points out, ‘many phonological and morphological structures [in Japanese]... can be generalized’.

These include compound clipping (Shibatani 1990:254-256), the formation of hypocoristics (Mester 1990; Poser 1990:81-93), accentuation patterns in compounds (Tsuji-mura & Davis 1987; Kubozono & Mester 1995; Aldrete 1999), loanword clipping (Itô 1990; Loveday 1996:138-152), reduplication in mimetics (Poser 1990:94-95; Hamano 1998:25-38) and the jazz argot *zūjago* (Tateishi 1985, cited in Poser 1990; Tateishi 1989; Itô, Kitagawa & Mester 1996; Kubozono 2002).

Related to this is the concept that the optimal word length in Modern Japanese is bimoraic (2μ) – one foot – and indeed the majority of NJ roots are of this length. By extension, we can therefore state the optimal length of two-element NJ compounds to be four moras, two feet, or one colon, and Rosen (2001) claims to have shown that this prosodic size, with one further condition (hereafter ‘PS’), plays a decisive role in marking NJ nouns for rendaku immunity. Rosen defines PS as being when ‘both members of the compound exceed one mora and at least one of the members of the compound exceeds two moras’ (opus cit.:28) and restricts membership to NJ nouns. In other words, in a N<sub>1</sub>-N<sub>2</sub> compound, both N<sub>1</sub> and N<sub>2</sub> must be at least one foot and N<sub>1</sub>-N<sub>2</sub> must exceed one colon. Rosen maintains that rendaku lovers and haters exhibit their usual predilectory behaviour when this PS is not attained (in ‘PS-fail’ compounds), but that when it is (in ‘PS-pass’ compounds) these same nouns undergo rendaku without exception. Ergo, a noun which does not exhibit rendaku in a PS-pass compound must be rendaku immune. Rosen’s principle can be summarized below, where (12) *kasu* ‘dregs’ is rendaku immune, (13) *kumo* ‘cloud’ is a rendaku lover and (14) *kusa* ‘grass’ is a rendaku hater (examples are from Rosen (2001), although English glosses are mine):

(12)	a.	PS-pass:	<i>iwasi</i> sardine	+	<i>kasu</i> dregs	>	<i>iwasikasu</i> ‘sardine meal’
	b.	PS-fail:	<i>sake</i> saké	+	<i>kasu</i>	>	<i>sakekasu</i> ‘saké lees’
(13)	a.	PS-pass:	<i>kinoko</i> mushroom	+	<i>kumo</i> cloud	>	<i>kinokogumo</i> ‘mushroom cloud’
	b.	PS-fail:	<i>yami</i> darkness	+	<i>kumo</i>	>	<i>yamikumo</i> ‘haphazardness’
	c.	PS-fail:	<i>yoko</i> side	+	<i>kumo</i>	>	<i>yokogumo</i> ‘cloud bank’
(14)	a.	PS-pass:	<i>hituzi</i> sheep	+	<i>kusa</i> grass	>	<i>hituzigusa</i> ‘water lily’
	b.	PS-fail:	<i>mizu</i> water	+	<i>kusa</i>	>	<i>mizukusa</i> ‘waterweed’
	c.	PS-fail:	<i>no</i> field	+	<i>kusa</i>	>	<i>nogusa</i> ‘wild grass’

In (12) *kasu* appears without rendaku as the second element in the 3 $\mu$ -2 $\mu$  PS-pass compound (12a) which, if Rosen's principle is correct, flags *kasu* as rendaku immune. This does indeed appear to be the case and (12b) is an example of *kasu* appearing without rendaku in a PS-fail compound (note that *kasu* appears in (11) above). On the other hand, both *kumo* and *kusa* exhibit rendaku in the PS-pass compounds (13a) and (14a), flagging them as predilectory. This is indeed, once again, the case, as (13bc) and (14bc) attest. Rosen's rendaku PS rule (RPS rule) has not yet been tested independently in print: the purpose of the following section. We shall see that some tweaking is required for an amended, and at last accurate, version of (11) to make itself known.

#### 4. Rosen's RPS Rule Assessed: I Analysis

Japanese dictionaries do not overtly mark headwords for vocabulary stratum, meaning the most swift and effective method of creating a NJ noun database, delimiting the contents of an electronic dictionary, is denied us. For this reason, I have turned to Martin's (1987:376-599) compendium of NJ nouns, the same corpus used by Rosen (2001:1). STEP 1 in assessing the validity of the RPS Rule was to excise the following nouns from Martin's compendium:

- (i) Those whose initial was not a voiceless obstruent (*k t s h*) – see (1) above.
- (ii) Those which contained a voiced obstruent anywhere in the non-initial element – see (2) above.
- (iii) Those consisting of only one mora – cf. Rosen's PS criteria.
- (iv) Those very few nouns marked by Martin as borrowings (e.g. *sata* 'tidings, news' from Chinese). However, those whose status as borrowings was indicated as questionable (e.g. *sake* 'salmon' from Ainu?) were retained.
- (v) Deadjectivals and deverbals. The latter may refer to an action (e.g. *hanasi* 'a talk, a speech' < *hanasu* 'to talk, to speak') or a concrete object (e.g. *hurui* 'sieve, strainer' < *huruu* 'to sift').
- (vi) Synchronically transparent compounds, whether the initial element be apophonic<sup>x</sup> (e.g. *hunani* 'ship's cargo' < *hune* 'ship' + *ni* 'cargo') or not (e.g. *kusomusi* 'gold beetle' < *kuso* 'dung' + *musi* 'insect'). Those nouns whose synchronic status as a compound was indicated as questionable through having been rendered obscure by phonological change (e.g. *haraka* 'kind of trout' < *hara* 'belly' + *aka* 'red?') were retained.<sup>xi</sup>

This left a residue of 498 sequentially-voiceable NJ nouns, of which 2 (0.4%) were 5 $\mu$ , 21 (4.2%) were 4 $\mu$ , 146 (29.3%) were 3 $\mu$  and 329 (66.1%) were 2 $\mu$ .

STEP 2 in the assessment was to ascertain whether each of these remaining nouns appeared in non-rendaku form as the second element in a PS-pass compound, thus marking it as rendaku immune. This was done as follows. Since (1) rendaku shows some degree of variability across native speakers as well as across dictionary entries and (2) this assessment is a synchronic one seeking as much as possible to avoid interference from obsolete vocabulary, it was decided to employ three different dictionaries, all of which should reflect the modern language on as large a scale as possible. The three dictionaries selected were the well-respected *Kōjien* (Shinmura

2003), *Daijisen* (Matsumura 1995) and *Daijirin* (Matsumura 2002), whose headword counts are approximately 240,000, 220,000 and 238,000 words respectively. Electronic versions of these dictionaries, whose software interfaces were equipped with wild-card functionality, allowed swift searching of second elements. The following criteria were employed in the STEP 2 search process:

- (a) The compound was PS-pass.
- (b) The second element had a voiceless initial and was thus not sequentially voiced.
- (c) The initial element was NJ.
- (d) The initial element was an underived noun, i.e. neither a deverbal nor a deadjectival.
- (e) The initial element was not itself a synchronically transparent compound (including compounds containing apophonic elements – see (vi) above). Where an initial element’s synchronic status as a compound was questionable through having been rendered obscure by phonological change, the compound was retained.
- (f) The compound was not dvandva – see (3) above.
- (g) The compound was listed in all three dictionaries (*Kōjien*, *Daijisen* and *Daijirin*) and was not listed with a rendaku alternative.
- (h) The compound was neither a toponym nor an anthroponym.<sup>xii</sup>

Of the 498 sequentially voiceable nouns remaining after STEP 1, 31 were found to appear as sequentially voiceless second elements in PS-pass compounds after the STEP 2 criteria (a)-(h) had been applied. These 31 were composed of four 4 $\mu$ -nouns, eighteen 3 $\mu$ -nouns and nine 2 $\mu$ -nouns and are listed in Table 1 below. Where a noun appeared in five or more PS-pass compounds, I have refrained from listing them all and have instead marked the ‘PS-pass compound(s)’ column as ‘5+'. It should be noted at this juncture that some of the NJ nouns and PS-pass compounds in Table 1 are obsolete – this issue shall be dealt with further below.

NJ noun	English gloss	PS-pass compound(s)
harakara	sibling	kotoharakara
hasi	edge	nisikihasi
haya	dace	aburahaya
himo	cord	usirohimo, siramihimo, haorihimo
hotaru	firefly	umihotaru
hotori	neighbourhood	katahotori, miyakohotori
humoto	foot of mountain	okahumoto
hutokoro	bosom	tanihutokoro, yamahutokoro
kamome	seagull	yurikamome
kaNna	plane	mizokaNna
kasu	dregs, lees	aburakasu, iwasi <del>kasu</del> , nisi <del>n</del> kasu
kata	person	omotekata
katati	shape	5+
katura	judas tree	tamakatura
kemuri	smoke	5+
konosiro	gizzard shad	tubamekonosiro
koomori	bat	aburakoomori, iekoomori, kanikoomori
koori	ice	kanakoori
koromo	gown	karakoromo
kuina	water rail	fuyukuina
kusiro	bracelet	isikusiro, suzukusiro, tamakusiro

kususi	physician	yabukususi
simo	frost	hadaresimo
sita	underneath	kanmurisita, yagurasita
sitomi	lattice shutters	yokositomi
sumire	violet	ezosumire, akanesumire, tubosumire
susuki	Japanese pampas	5+
take	mushroom	5+
tosaka	cockscorn	umitosaka
tukasa	official, office	takatukasa
tuki	cup	yusurutuki

Table 1: NJ nouns occurring in sequentially voiceless PS-pass compounds

STEP 3, the final step in the assessment of the RPS Rule, is an examination of the logical corollary of Rosen's claim that rendaku lovers and haters exhibit exceptionless rendaku in PS-pass compounds: that NJ nouns which do not exhibit rendaku in PS-pass compounds (the 31 nouns in Table 1 above) are rendaku immune. This was done by utilizing the same three dictionaries as in step two and employing the following criteria in the search process:

- (α) The noun appeared sequentially voiced as the second element in a compound of any prosodic size.
- (β) The initial element of such a compound was NJ.
- (γ) The initial element was an underived noun, i.e. neither a deverbal nor a deadjectival.
- (δ) The initial element was not itself a synchronically transparent compound (including compounds containing apophonic elements). Where an initial element's synchronic status as a compound was questionable through having been rendered obscure by phonological change, the compound was retained.
- (ε) The compound was listed in all three dictionaries (*Kōjien*, *Daijisen* and *Daijirin*) and was not listed with a sequentially voiceless alternative.
- (ζ) The compound was neither a toponym nor an anthroponym.

Of the 31 nouns in Table 1 only 11 appeared in any compounds conforming to the criteria (α)-(ζ) above. These 11 were composed of one 4μ-noun, five 3μ-nouns and five 2μ-nouns and are listed in Table 2 below along with the compounds in which they appeared.

NJ noun	English gloss	sequentially voiceless PS-pass compound(s)	sequentially voiced compound(s)	Group
hasi	edge	nisikihasi	hasibasi	I
sita	underneath	kanmurisita, yagurasita	sitazita	I
koromo	gown	karakoromo	5+	II
simo	frost	hadaresimo	tuyuzimo	II
tukasa	official, office	takatukasa	5+	II
tuki	cup	yusurutuki	sakaduki	II
hotaru	firefly	umihotaru	tutibotaru	III
hutokoro	bosom	tanihutokoro, yamahutokoro	utibutokoro, sotobutokoro	III
kanna	plane	mizokanna	nakaganna, wakiganna, yariganna	III
kata	person	omotekata	5+	III
koori	ice	kanakoori	tanagoori, hanagoori, hatugoori	III

Table 2: Expected *rendaku*-immune nouns occurring in sequentially voiced compounds

Once again, ‘5+’ in the sequentially voiced compound(s)’ column indicates that a noun was found in five or more PS-pass compounds. Although these 11 nouns fail Rosen’s RPS Rule in its current form, they can be clearly grouped into three types, indicated as I to III in the righthandmost ‘group’ column. These groupings and the implications they have for a modification of the RPS Rule will be discussed in the following section.

## 5. Rosen’s RPS Rule Assessed: II Discussion

Although the 11 nouns listed in Table 2 may at first glance appear to have negative implications for the integrity of the RPS Rule, I shall show in this section that a reformulation, by way of additional conditions, is possible.

Before, however, proceeding to a description and analysis of Groups I – III, some caveats. It should be noted that Table 2 is not necessarily complete. It must be borne in mind that only three dictionaries were used and, although the author remains confident as to his selection of dictionaries and criteria for noun and compound inclusion, different dictionaries and/or the application of laxer or more stringent criteria might have produced a slightly different outcome. Moreover, it must be remembered that Martin’s NJ noun compendium was created for the purposes of historical reconstruction and contains nouns attested in Old and Middle Japanese sources.

It is also necessary to point out that the nouns listed in Table 2 do not appear to have anything in common that would allow us to postulate an obvious exception to or extension of the RPS Rule. There would appear to be nothing of statistical significance as far as the initial obstruents or moraic composition of the NJ nouns are concerned, nothing of statistical significance as far as the PS of the sequentially voiced compounds is concerned, and, further, nothing of statistical significance when it comes to the suprasegmental patterning of either (both the nouns and compounds in Table 2 are of varying accentual patterns). Other factors appear to hold the key.

The two nouns in Group I, *hasi* and *sita*, both appear in the reduplicative compounds *hasibasi* ‘odds and ends’ (lit. ‘edges’) and *sitazita* ‘underlings, those below one’. As noted in (3c), reduplicative compounds are technically *dvandva*, and *dvandva* compounds have always been treated as a special case in the literature. It was because *dvandva* compounds in general are expected not to exhibit *rendaku* that they were excluded from the STEP 2 dictionary search (criterion (f)) and not included as a criterion in the STEP 3 search. It is now clear that this latter decision was in error. *Dvandva* compounds, whether reduplicative or not, must be taken out of the equation altogether (and an additional STEP 3 criterion disallowing *dvandva* compounds added) for Rosen’s RPS Rule to hold.

Group II is composed of four nouns: *koromo*, *simo*, *tukasa* and *tuki*. The issue of obsolete vocabulary has already been alluded to above. Although the three dictionaries employed for the assessment in §4 were selected based on the belief that their focus on the modern language was appropriate for a synchronic analysis, there remained two problematic areas which I have delayed discussing until this juncture. The first is that none of these three dictionaries (in fact, Japanese dictionaries in general) overtly mark a headword as ‘obsolete’ or ‘archaic’. There exists no objective method of gauging a

word's defunct status in modern Japanese beyond (a) noting that the dictionary definition is brief and ends with a citation from a classical Japanese text; or (b) laboriously cross-checking against Japanese-foreign language dictionaries which tend to eschew archaisms. Neither of these methods can provide hard empirical data. The second problem is that Martin's (1987) NJ noun compendium, due to its very *raison d'être*, includes a number of such archaic nouns. This absence of any objective criterion for obsolete status meant naturally that none was applied at either STEP 1, 2 or 3 and that a small number of archaic words and compounds have slipped into Table 2. By the two, admittedly empirically weak, objective methods just outlined, as well as after consultation with native speakers, I have judged the noun *tuki* to be obsolete, as well as its compound *yusurutuki*, and the three PS-pass compounds *karakoromo*, *hadaresimo* and *takatukasa*. Rosen's RPS Rule must be applied in a robustly synchronic fashion and archaisms ignored in order to hold.

Group III is the problematic residue: its five members, *hotaru*, *hutokoro*, *kaNna*, *kata* and *koori* all present, to a greater or lesser extent, a challenge to Rosen's RPS rule. Nonetheless, a number of speculative analyses are possible, the first of which is semantic. A total of five Group III compounds, *utibutokoro* 'breast pocket, bosom of a kimono, true circumstances, true intentions', *sotobutokoro* 'bosom of a kimono', *nakagaNna* 'trying up plane', *wakigaNna* 'grooving plane' and *omotekata* 'theatre staff' have locational first elements: *uti* 'inside', *soto* 'outside', *naka* 'inside', *waki* 'side' and *omote* 'front'. While in the context of the five Group III nouns only, such locational initial elements are heavily represented, in the context of Table 2 as a whole they appear elsewhere only in *sitazita* and (arguably) in *hasibasi*. Although admittedly highly speculative, positing some kind of restraint on such locational elements would deal with both *hutokoro* and *kata*, as well as (arguably) obviating the need for a separate Group I. With *koori*, we find that, while the compound in which it appears, *kanakoori* 'an extremely cold object' ('icicle' in some modern dialects), is not obsolete, it is certainly infrequent and probably non-standard. Both *hotaru* and *kaNna* still remain, however. With the latter, although the tentative locational element hypothesis puts pay to *nakagaNna* and *wakigaNna*, *mizokaNna* 'base plane' still remains. The situation with *hotaru* is also inexplicable: *umihotaru* 'sea firefly' and *tutibotaru* 'glowworm' exhibit an identical 2 $\mu$ -3 $\mu$  PS-pass prosodic size but contradictory rendaku behaviour. All that can be said here is that although not listed in any of the three dictionaries employed for the purposes of this assessment, *mizogaNna* and *umibotaru* do appear online in sequentially voiced form. While the latter is outgoogled by its sequentially voiceless partner by a ratio of approximately 70 to 1, the former actually outgoogles its sequentially voiceless partner 6 to 1.<sup>xiii</sup> Clearly, for *mizokaNna*, there is a large gulf between internet usage and dictionary listings.

## 6. Implications and Conclusions

The analysis carried out in §4 and its discussion in §5 allow me to now present a modified RPS Rule. My modifications are in italics, the remainder is condensed from Rosen (2001, 2003):

- Nouns are defined as non-deverbals and non-deadjectivals, are restricted to the native Japanese vocabulary stratum, *are not names and must be synchronically 'live', i.e. not obsolete.*
- N<sub>1</sub>-N<sub>2</sub> compounds are defined as those which are composed of two such nouns, *but which are neither dvandva nor reduplicative compounds.*
- If a sequentially voiceable N<sub>2</sub> occurs as sequentially voiceless AND both N<sub>1</sub> and N<sub>2</sub> are each at least one foot (2 moras) in length AND N<sub>1</sub>-N<sub>2</sub> exceeds one colon (4 moras) in length, THEN N<sub>2</sub> is rendaku immune in all N<sub>1</sub>-N<sub>2</sub> compounds regardless of prosodic size.

One implication of this modified rule is that a highly robust list of rendaku immune nouns can now be put forward. Those nouns in Table 1 which did not feature as potentially problematic cases in Table 2 number 20 in total and are listed in (15) below. Those rendaku immune candidate nouns which I believe to be obsolete are in bold, while those which occur only in PS-compounds which I believe to be obsolete are underlined.<sup>xiv</sup>

(15)	<u>harakara</u>	<i>haya</i>	<i>himo</i>	<u>hotori</u>	<i>humoto</i>	<i>kamome</i>
	<i>kasu</i>	<i>katati</i>	<i>katura</i>	<i>kemuri</i>	<i>konosiro</i>	<i>koomori</i>
	<i>kuina</i>	<b><i>kusiro</i></b>	<b><i>kususi</i></b>	<i>sitomi</i>	<i>sumire</i>	<i>susuki</i>
	<i>take</i>	<i>tosaka</i>				

If we remove these 4 NJ nouns, we are left with 16 NJ nouns demonstrably rendaku immune by the modified RPS rule:

(16)	<i>haya</i>	<span style="border: 1px solid black; padding: 2px;"><i>himo</i></span>	<i>humoto</i>	<i>kamome</i>	<span style="border: 1px solid black; padding: 2px;"><i>kasu</i></span>	<i>katati</i>
	<i>katura</i>	<span style="border: 1px solid black; padding: 2px;"><i>kemuri</i></span>	<i>konosiro</i>	<i>koomori</i> <sup>xv</sup>	<i>kuina</i>	<i>sitomi</i>
	<i>sumire</i>	<i>susuki</i>	<i>take</i>	<i>tosaka</i>		

Of these, we find that only three, *himo*, *kasu* and *kemuri* (boxed in (16)), appear in the list of rendaku immune nouns previously proposed in (11) and restated (though reordered) below:

(11)	<span style="border: 1px solid black; padding: 2px;"><i>himo</i></span>	<span style="border: 1px solid black; padding: 2px;"><i>kasu</i></span>	<span style="border: 1px solid black; padding: 2px;"><i>kemuri</i></span>	<i>sio</i>	<i>tuti</i>	<i>kase</i>	<i>saki</i>	<i>hime</i>	<i>tuyu</i>
------	---	---	---	------------	-------------	-------------	-------------	-------------	-------------

Of the remaining six nouns in (11) two (*sio*, *tuti*) did occur sequentially voiceless in PS-pass compounds but never across all three dictionaries, while the other four (*kase*, *saki*, *hime*, *tuyu*) did not occur in any PS-pass compounds whatsoever. While there is no empirical evidence for these six nouns' rendaku immune status, there is equally nothing to deny it. As Martin (1987:114) has noted in connection with rendaku immunity in general: 'failure to indulge in rendaku may be accidental: some nouns have few compounds, and others offer only a single rendaku example, often obsolete or archaic'.<sup>xvi</sup> While this is not true for the remaining six nouns in (11) – the very reason why they have been cited frequently in the literature as rendaku immune – it is certainly the reason why those nouns in (16) but not in (11) have not been cited to any degree before. It has taken the empirical approach demonstrated here to lure them into the open.

Another implication of the modified RPS Rule is that the mora now appears to play a role not just in clipping, compound accentuation, mimetic reduplication and the other phonological and morphological phenomena mentioned in §3, but in rendaku immunity also. The author acknowledges that despite the refinements to Rosen's RPS Rule stated above, five nouns, *hotaru* 'firefly', *hutokoro* 'bosom', *kaNna* 'plane', *kata* 'person' and *koori* 'ice' remain problematic. The history of rendaku research has shown that an ultimate solution to its conditioning factors has proceeded in a series of small steps. Each of these has sought to further deepen our understanding of the allomorphy, but each has left a miniscule trail of apparent exceptions in its wake. Viewed in this wider historical perspective, the five exceptions just cited are merely another such miniscule trail which the author feels sure future research will resolve.

### Endnotes

<sup>i</sup> The one other voiceless obstruent in Modern Japanese, *p*, occurs word-initially only in foreign (e.g. *pasuta* ‘pasta’) and mimetic (e.g. *piQtari* ‘snugly, perfectly’) lexemes, neither of which can undergo rendaku – see further below.

<sup>ii</sup> As Vance (2007:155) notes, ‘the difference between the voiced phoneme and the voiceless phoneme is more than just the presence or absence of voicing’. In (1a) *g* may actually be realised [ŋ] by some speakers; in (1b) *tu* is [ts]u, while *du* is generally [z]u; and in (1d) morpheme-initial Modern Japanese *h* derives from an earlier /p/, hence the *h*-*b* allomorphy (cf. Kiyose 1985; Martin 1987:10-13ff; Rothaug 1991:19ff; Numoto 2007).

<sup>iii</sup> Variations on the ‘Lyman’s Law’ constraint, and their history, are discussed in Vance 1980b, 2007. Exceptions to the Law are discussed in detail by Martin 1987:115. See also Tamura 1972:143; Kindaichi 1976:5; Vance 1979:App. 1.

<sup>iv</sup> See, however, Vance (1980a:234) and Kubozono (2005:12-15) for criticism. In addition to (1-4), Haraguchi (2001) lists some 23 factors which he claims regulate rendaku. Martin (1987:115-116) also lists some other ‘unusual cases of rendaku’.

<sup>v</sup> Although NJ, SJ and FJ, as well as mimetic and hybrid strata, have all been proposed, few scholars would acknowledge the existence of all five. The vast majority note three (e.g. Martin 1952; Gottlieb 2005) or four (e.g. McCawley 1968; Vance 1987; Shibatani 1990). A few scholars (Rice 1997; Ota 2004) are sceptical as to the existence of lexical stratification in Japanese at all. Further, rather than models based on lexical strata, Itô & Mester (1995, 1999), Fukuzawa, Kitahara & Ota (1998), Fukuzawa & Kitahara (2005) and others posit core-periphery or set-inclusion models.

<sup>vi</sup> Here, and elsewhere in this paper, pitch patterns are those of ‘standard’ Tokyo Japanese.

---

<sup>vii</sup> Rosen's (2001) database includes a few deadjectival initial elements, but no deverbals.

<sup>viii</sup> Other scholars have, of course, cited and commented upon NJ nouns which fail to undergo rendaku, both pre- and post-Vance (1979), including Rosen (2003). One such seminal paper is Nakagawa (1966) who coined the Japanese term *rensei* 'sequential voicelessness' to describe such behaviour. Here, however, I limit my citations to those scholars who have published lists of such nouns.

<sup>ix</sup> The well-documented (e.g. Martin 1987:31-32) presence of variation between the word-internal labials *-b-* and *-m-* in Old and Middle Japanese, to a lesser extent across Modern Japanese dialects, and to a lesser extent still within Modern Standard Japanese (e.g. *sabisii* ~ *samisii* 'lonely') means, as Nakagawa (1966) pointed out, that rendaku immunity may have developed due to the former presence of the voiced obstruent *b* (cf. (2)). The two nouns in (11) whose internal *-m-* is underlined have, according to Martin, earlier attestations with *-b-* and thus highly likely to exhibit rendaku immunity due to 'Lyman's Law'.

<sup>x</sup> A small group of nouns with variation in their final vowel: a free (or 'exposed') form and a compound (or 'covered') form. The most common variation is between final free *-e* and final compound *-a*. Though no longer productive, apophonic variation is synchronically transparent. See, *inter alia*, Frellesvig & Whitman (2004: 284-285) for a more detailed description.

<sup>xi</sup> Although quite a number of nouns in Martin's compendium are obsolete and do not even appear in modern dictionaries these were not excluded – to check once for obsolescence (and, moreover, to have to define 'obsolescence') and then again for their appearance in a compound would have been inefficient.

<sup>xii</sup> Cross-linguistically names often exhibit aberrant behaviour and rendaku is no exception: see, for example, Sugito (1965), Nakagawa (1978), Hirano (2000) and Zamma (2005).

<sup>xiii</sup> When the compounds were searched as both a *hiragana* and *katakana* 'exact wording or phrase' on 15 March 2008. The combined *kana* voiced-voiceless 'Google approximate hits' were approximately 215 against 35 for *mizogaNna* / *mizokaNna* and 1,600 against 112,000 for *umibotaru* / *umihotaru*.

<sup>xiv</sup> No rendaku immune candidate nouns occurred in reduplicative PS-pass compounds, or only in PS-pass compounds with locational initial elements. In other words, the only proposed modification to Rosen's PS Rule, tentative or otherwise, which has any impact on rendaku immune candidates is archaism.

<sup>xv</sup> Like *kemuri* and *himo*, *koomori* too may be rendaku immune due to the former presence of a voiced obstruent *b*: see endnote 9.

<sup>xvi</sup> Rosen (2003:14) lists a group of NJ nouns which occur in 'only a few compounds', thus rendering them 'either rendaku-immune or rendaku-resistant [rendaku-haters]'.

# Passive morphology relating Korean to the Transeurasian languages

**Martine Irma Robbeets**

martine\_robbeets@hotmail.com

## **Abstract**

The present paper discusses the historical development of passive morphology in Korean and the other Transeurasian languages. The term “Trans-Eurasian” is used in reference to Japanese, Korean, the Tungusic languages, the Mongolic languages and the Turkic languages. In the first section a cross-linguistic framework for the grammaticalization of passives is introduced. In the second section etymologies are proposed for three passive formants lexicalized in Korean, relating them to verbal morphemes in the Transeurasian languages. The etymologies reflect two common pathways of grammaticalization: the passive markers are derivable from causatives or from reflexives and anticausatives. In the conclusion the significance of shared passive morphology for the affiliation question of the Transeurasian languages is underlined.

## **1. Introduction**

In many languages across the world, passive markers are not restricted to this function but can have other uses, such as causative, reflexive, reciprocal, anticausative and potential passive (Langacker and Munro 1975, Shibatani 1985, Haspelmath 1990: 32-37 among others). This polysemy finds its explanation in the historical development of passive morphemes. Their diachronic source largely falls apart in four possible pathways of grammaticalization (Haspelmath 1990: 54), the latter two of which are relevant for the present study.

1. A plural pronoun or a general person noun enters a generalized subject construction where it takes a desubjective meaning and, it finally grammaticalizes into a passive. This is reminiscent of French desubjective *on* constructions, where *on* is cognate with Latin *homo* ‘man, person’.

2. Auxiliaries such as ‘become’, ‘go’, ‘fall’, ‘undergo’, ‘suffer’, ‘eat’ etc. grammaticalize into passive morphemes. The Korean auxiliary *ci-* ‘grow, become’, for instance, enters passive constructions such as with *phulta* ‘loosen, untie’ in *phule ci-* ‘get loose, become untied’.

3. Causative markers can develop into passive markers. The pathway of this development involves a permissive, a causative of the ‘let’ type (Johanson 1974, 1975; Keenan 1985: 262-263; Babby 1993; Malchukov 1993) and a reflexive-causative construction (Haspelmath 1990: 46-49). Example (1) illustrates the transition with English examples.

- a. I make Marc embrace the child. (factitive caus.)
- b. I let Marc embrace the child. (permissive caus.)
- c. I let Marc embrace me. (coreferential caus.)
- d. I have myself embraced by Marc. (reflexive caus.)
- e. I am embraced by Marc. (passive)

A semantic difference between causative and passive is that the former denotes two situations, whereas the latter denotes only one situation. A syntactic difference is that the initial subject becomes the direct object of causation, whereas it becomes the indirect object of the passive construction. The permissive occupies a common ground between the two categories. Semantically it denotes two situations (in b. I did not do sth. and Marc embraces because of that) like the factitive causative (in a. I did sth. and Marc embraces because of that), but the causation in b. is due to a nonoccurrence of an action. Only one action occurs. On this point the permissive is similar to the passive. Syntactically the initial subject can become the indirect object of the permissive construction. In Japanese, for instance, the causative conversion of intransitives transforms the initial subject into an indirect object with *ni* for permission and into a direct object with *wo* for coercion (Martin 1988: 292-293).<sup>1</sup> Malchukov (1993: 372) illustrates how in causative constructions of Even transitives, the initial subject occupies an indirect object position with permissives and a direct object position with factitives. The examples c. and d. differ from b. in that the subject is both the causer and the affected entity. Semantically they are closer to the passive to the extent that the subject is also affected by the event. The coreferential causative construction in c. has double agency (I and Marc) whereas the reflexive-causative construction in d. has only one agent (I). When the agentive subject is demoted to the patient role as in d., it gives rise to a passive construction.

4. Reflexive markers take up an anticausative meaning and finally develop into a passive marker. German *Er wäscht sich* ‘He washes himself’, for instance, uses an independent stressed pronoun *sich* for reflexive meaning. In *Die Tür öffnet sich* ‘The door opens’, the pronoun *sich* has developed into a clitic for anticausative use. The reflexive use is restricted to clauses with an agentive subject. Dropping the agency restriction leads to the anticausative

use. But the anticausative sense is restricted in another way: it denotes a spontaneous process without an implied agent. The main difference with respect to the passive is that in the passive an agent is implied and can often be expressed in an oblique phrase. German *sich* has not yet been generalized to passive use. In German actions that imply an agent, such as *schreiben* ‘write’, cannot take the pronoun *sich*: \*\**Der Brief schreibt sich* is ungrammatical. In Russian, on the contrary, the reflexive *-sja* can indicate the passive in addition to the anticausative, e.g. *Pis'mo pišet-sja* ‘The letter is written’.

The present paper proposes etymologies for three Korean passive formants in relation to verbal morphology in the Transeurasian languages. The etymologies reflect the latter two pathways: the passive morphemes are derivable from causative markers or they are relatable to reflexive, reciprocal and anticausative markers. The term “Trans-Eurasian” is used instead of the more common label “Altaic”, in reference to a vast zone of geographically adjacent languages stretching from the Pacific in the East to the Black Sea in the West. At most the label covers five linguistic families: Japanese, Korean, Tungusic, Mongolic and Turkic. At least it constitutes a single linguistic family by itself. The very question of genealogical relationship of the Transeurasian languages is among the most disputed issues of linguistic history. The controversy does not involve any paucity of linguistic similarities; it rather lies in how to account for them. The main obstacle is whether all shared properties are triggered by language contact or whether some of them are the result of genetic retention.

Shared passive morphology can be particularly telling in this matter. Bound passive suffixes are relatively stable in language and therefore diagnostic of genetic retention. Cross-linguistically it is observed that languages tend to copy nouns more easily than verbs, free lexemes are more copiable than bound morphemes, and derivational morphology is less stable than inflectional morphology. The description of copiability as a relative tendency leads to the assumption that bound, inflectional, verbal morphology provides rather reliable evidence to demonstrate common ancestorship. Johanson (1992, 1999, 2002) has further refined our notion about borrowability -and hence genetic stability- defining a restricted core of verbal inflectional affixes that is highly telling in matters of genetic relatedness. Johanson (1999: 8) finds that “In the verbal flexion, suffixes closest to the primary stem, markers of actionality and diathesis, seem relatively little susceptible to copying. It would be a strong clue to a common origin if this ‘intimate’ part of verbal morphology exhibited systematic correspondences of materially and semantically similar morphemes with congruent combinational patterns”. Comrie (1995: 394; foreword to Johanson 2002: xi) confirms Johanson’s findings: “... in particular the extreme resistance to copying of the positions closest to the verbal stem might provide a more reliable tool than many of those used in the

past to whether there are indeed shared elements that testify to genetic relatedness, ..., among the groups of languages that constitute Altaic”.

## 2. Etymologies for passive markers

As a consequence of their relative conservatism, the diathetical suffixes compared in this study are no longer fully productive: they have lexicalized into verb stems. Since diathetical markers have a high semantic content, they will according to Bybee (1985a/b) easily lexicalize. The asymmetric relationship between a verb and its formally derived counterpart preserves relics of earlier inflection. The reconstruction of suffixes is supported by verb pairs consisting of a verb of neutral diathesis, along with its derived counterpart. The counterpart is preceded by the symbol =>. The asterisk \* is used for reconstructed forms.

For Japanese, Korean, Mongolic and Turkic we use material from the eldest unambiguously written stages: Old Japanese (8th C), Late Middle Korean (15th-16th C), Middle Mongolian (13th-17th C), Written Mongolian (13th C - present) and Old Turkic (8th-14th C). For the historical study of Tungusic languages it is unfortunate that written records are rather scarce for most of the languages. Although we have extensive literature that is written in Manchu, when the Manchus were in power in China during the Qing dynasty (1644-1911), this language is highly sinicized. Because it does not always preserve crucial parts of morphology, I make additional reference to the contemporary Tungusic languages: Evenki, Even, Solon, Negidal, Nanai, Ulcha, Orok, Oroch, and Udehe.

For the transliteration of linguistic forms, the present paper uses the Yale system for Japanese and Korean. The Old Japanese vowel distinctions are referred to as  $i_1$  versus  $i_2$ ,  $e_1$  versus  $e_2$  and  $o_1$  versus  $o_2$ . The Middle Korean unrounded vowels [ə] and [ɨ] are represented by  $o$  and  $u$  respectively, while  $wo$  and  $wu$  are used for rounded [o] and [u]. The notation  $ẓ$  is used to represent the now obsolete Middle Korean triangle grapheme Δ. The capitals  $W$  and  $G$  are used for two other obsolete consonants for which the phonological interpretation is probably [β] and [ɣ]. The dots in the Middle Korean words represent the distinctive pitch of the following syllable: one dot for high, two dots for rising, and unmarked syllables are treated as low.

The transliteration rules for transcribing the individual Tungusic languages follow the romanization proposed by Gorelova (2002) for Manchu, Nedjalkov (1997) for Evenki (with the modifications  $c, j, y, ñ, i$  for Nedjalkov's notations  $ch, d', j, n', y$  respectively), Benzing (1955b) for Even (with the modifications  $j, y, ñ, i$  for Benzing's notations  $ʒ, j, n, ə$  respectively), Nikolaeva (1999) for Udehe (with the modifications  $j, y$  for Nikolaeva's

notations *z, j* respectively) and a romanization based on Avrorin's (1961) Cyrillic transcription of Nanai. The logic that underlies the modifications is a consistent use of *c, j* for the palatal fricatives, *y* for the palatal glide and *ñ* for the palatal nasal.

The transliteration of the Written Mongolian forms follows Poppe's (1954) conventions with the modifications *c, j* for Poppe's notations *č, ĵ*. For Middle Mongolian Rybatzki (2003) is followed with the exception of *š, γ* for Rybatzki's notations *sh* and *gh*. The transcription of the Turkic forms follows Johanson & Csató (1998) except for the probably reduced vowel type *°* for which the notation *X* is used. For all languages a collon placed after a vowel is used to indicate length.

### 2.1. *pK \*-ki-*: from causative to passive

*Korean.* In (Middle) Korean we find the causative-passive suffixes K *-ki-*, *-hi-*, *-i-* MK *-ki-*, *-Gi-*, *-hi-*, *-i-* that are derivable through velar lenition as allomorphs from *pK \*-ki-* (Ramstedt 1939: 133-137, Lewin 1970: 14, Martin 1992: 221-225, 623, Yeon 2003: 142-146). The causative alternation is attested in verb pairs such as K *olm-*, MK *wolm-* 'move (intr.)' => K *olmki-*, MK *wolm·ki-* 'move (tr.)', K *swum-*, MK *swum-* 'lie hidden (intr.)' => K *swumki-*, MK *swum·ki-* 'conceal (tr.)', K *ip-*, MK *nip-* 'wear' => K *iphi-*, MK *nip·hi-* 'cause to wear' and K *mek-*, MK *mek-* 'eat' => K *meki-*, MK *me·ki-* 'feed'. The passive alternation is present in pairs such as K *a:n-* 'embrace (tr.)' => K *a:nki-* 'embrace (tr.), get embraced (intr.)', K *ccic-* 'tear (tr.)' => K *ccicki-* 'be torn', K *ttut-* 'bite, graze (tr.)' => K *ttutki-* 'cause to graze (tr.), get bitten (intr.)' and K *elk-*, MK *elk-* 'tie (tr.)' => K *elkhi-*, MK *el·khi-* 'get tied (intr.)'.

*Japanese.* A plausible cognate is present in the Japanese causative-passive suffix *-(C)i-*, that derives bigrade verbs from quadrigrade counterparts. It is referred to by Unger (1977: 131) that "changes endo-active verbs into exo-active and vice versa", by Martin (1987: 672) as a "formant making transitive/ intransitive forms" and by Vovin (2001: 187-189) as a "transitivity flipper". The verb pairs below illustrate that the suffix can also derive causatives from transitives and passives from intransitives. This argues for the description causative-passive rather than reverse transitivity of the base. The causative alternation is attested in verb pairs such as OJ *ak-* 'open (intr.)' => *ake<sub>2</sub>-* 'open (tr.)', OJ *uk-* 'float (intr.)' => *uke<sub>2</sub>-* 'float, let float (tr.)', OJ *ap-* 'meet, fit, agree (tr.)' => *ape<sub>2</sub>-* 'join (tr.)', OJ *pak-* 'slip (sth.) on, wear (tr.)' => *pake<sub>2</sub>-* 'have/let (so.) wear (tr.)', while passive pairs are attested in OJ *ok-* 'put (tr.)' => *oki<sub>2</sub>-* 'arise (intr.)', *sak-* 'rip, split (tr.)' => *sake<sub>2</sub>-* 'get ripped, split (intr.)'. Intransitive quality verbs such as OJ *aka-* '(be) red' => *ake<sub>2</sub>-* 'get bright, dawn' and OJ *puru-* '(be) old' => *puri-* 'get old' are transformed into passives with the suffix *-(C)i-*.

As far as the formal reconstruction is concerned, quadrigrade verbs (e.g. OJ *uk-* ‘float’, *ok-* ‘put’) with bigrade counterparts (e.g. OJ *uke<sub>2</sub>-* ‘let float’, *oki<sub>2</sub>-* ‘arise’) can be derived from vowel final roots (pJ *\*ukV-*, *\*okV-*). The exact nature of the vowel (pJ *\*uka-*, *\*oko-*) becomes clear from covert derivations including the roots (e.g. OJ *ukab-* ‘float’, *okor-* ‘rise’, *okos-* ‘raise’). It is confirmed by the quality of the bigrade vowel (e.g.  $e_2 < *ai$  in *uke<sub>2</sub>-*,  $i_2 < *oi$  in *oki<sub>2</sub>-*). This supports the derivation of OJ *uke<sub>2</sub>-* ‘let float’ from pJ *\*uka-* ‘float’ and causative *-(C)i-* and of OJ *oki<sub>2</sub>-* ‘arise’ from pJ *\*oko-* ‘raise’ and *-(C)i-* passive. More problematic than the vowel is the consonant in pJ *\*-ki-*. Since there are no strings of two subsequent vowels in Old Japanese (Martin 1987: 64-65), Japanese *-(C)i-* must go back to a consonant initial suffix, but evidence for the exact nature of the consonant is missing. However, velar elision before a high front vowel is sporadically attested in Japanese. It occurs word-internally as for instance in *tuitati* ‘first day of the month, new moon’ that is derivable from *tuki* ‘moon’ and a deverbal noun from *tatu* ‘stand’. Velar elision is also found on suffix boundaries as in the adjective attributive OJ *-ki* that developed into contemporary *-i* in for instance the attributive form OJ *taka-ki* for J *taka-i* ‘high’. For reasons explained in Robbeets (2005: 53-55) I do not reconstruct voice distinction in proto-Japanese.

*Tungusic.* The comparison further includes a denominal creative suffix pTg *\*-ki-* ‘make, create’ in Tungusic, such as in Evenki (Nedjalkov 1997: 301, Konstantinova 1964: 198) *gule* ‘house’ => *guleŋ-* ‘build a house’, Evk. *a:cin* ‘nonexistent, absent’ => *a:cinŋi-* ‘liquidate’, in Even (Benzing 1955b: 34) *hulta* ‘fish meal’ => *hultak-* ‘produce fish meal’, Even *hotoran* ‘road, way’ => *hotarag-* ‘pave a way, make a road’ and in Udehe *xokto* ‘road’ => *xoktoŋi-* ‘make a road’, Ud. *aŋa* ‘night shelter’ => *aŋaŋi-* ‘make a night shelter’. The suffix pTg *\*-ki-* also occurs as a deverbal causative such as in Evenki (Vasilevič 1940: 93, Nedjalkov 1997: 230) *jalup-* ‘get filled (intr.)’ => *jalupki-* ‘fill (tr.)’, Evk. *kese-* ‘suffer (intr.)’ => *kese:gi-* ‘torture (tr.)’, in Even (Benzing 1955b: 43) *hi:l-* ‘suffer, worry (intr.)’ => *hi:lgi-* ‘harm, bother, plague (tr.)’, Even *ha:n* ‘be smoky’ => *ha:mŋi-* ‘fumigate, smoke (fish, meat) (tr.)’ and in Nanai *u:n-* ‘melt, thaw (intr.)’ => *u:nŋi-* ‘melt, thaw (tr.)’, Na. *ure-* ‘grow (intr.)’ => *uji-* ‘nurse, feed, raise (tr.)’.

Benzing (1955a: 1065, 1070) treats the denominal suffix pTg *\*-gi-* ‘machen’ and the deverbal causative suffix pTg *\*-gi-* as distinct markers. The present study, however, takes the position that the causative and the auxiliary ‘make’ are internally related through a common process of grammaticalization. As far as the formal reconstruction is concerned, pTg *\*ki-* is preferred to Benzing’s pTg *\*gi-*. The distribution in the Tungusic languages is suggestive of the original variant allomorphy of the suffix. Voiceless *ki-* voices to *-gi-* after the liquid *-r-* and assimilates to *-ŋi-* after the dental nasal *-n-*. In longer sequences the suffix vowel can be omitted.

*Mongolic.* As an independent verbal root for ‘do, make’ pMo \**ki-* is attested in the Secret History as SH MMo. *ki-*, in the literary language as WMo. *ki-*, and it preserves reflexes across all contemporary Mongolic languages: Khal. *xij-*, Bur. *xe-*, Kalm. *ke-*, Ordos *ki:-*, Dong. *kie-*, Bao. *ke-*, *giə-*, Dag. *ki:-*, *xi:-*, *ši:-*, Mgr. *gi-*, *gə-*, Mogh. *ki-*.

*Turkic.* An independent root pTk \**kil-* ‘do, make’ is reconstructable in Turkic. In the Orkhon inscriptions and Old Uighur we find OTk. *kil-*, Karakhanide has *kil-* and Middle Turkic *qil-*. In the contemporary Turkic languages we find Tk. *kil-*, Tat. *qil-*, Uzb. *qil-*, Uigh. *qil-*, Az. *gil-*, Tkm. *qil-*, Khak. *xil-*, Shor *qil-*, Chu. *əs-xəl* ‘deed’, Tuva *qil-*, Kirg. *qil-*, Kazakh *qil-*, Nog. *qil-*, Bash. *qil-*, Karaim *qil-*, Karakalpak *qil-*, Kumyk *qil-*.

## 2.2. pK \*-pu/o-: from reflexive to passive

*Korean.* The Korean passive pK \*-*pu/o-* has lexicalized in pairs such as MK *alh-* ‘suffer from, ail’ => MK *alpo-* ‘be painful’, MK *ceh-* ‘fear’ => MK *cephu-* ‘be fearsome’, MK *ich-* ‘tire, make tired’ => MK *ispu-* ‘be tired’, MK *pach-* ‘rush, busy oneself with’ => MK *paspo-* ‘be busy’, MK *mit-* ‘believe’ => MK *mit-pu-* ‘be credible’, MK *sulh-* ‘grieve over’ => MK *sulphu-* ‘be sad’ (Ramstedt 1952: 157-160, 1939: 128; Ramsey 1978: 218-220; Martin 1992: 760-761).

*Japanese.* A plausible cognate in Japanese is pJ \*-*pa-*. It has lexicalized as a deverbal passive in pairs such as OJ *atar-* ‘hit, touch, be equal, apply to’, *ate-* ‘apply, hit, succeed’ => *atap-* ‘be suitable, be possible’, OJ *kate-* ‘join, unite, blend’ > *katap-* ‘become intimate’, OJ *tute-* ‘communicate, transmit’ > *tutap-* ‘be communicated, be transmitted’, OJ *yasum-* ‘rest’ > *yasumop-* ‘be rested’, OJ *um-* ‘give birth’ > *umapar-* ‘be born’. It derives fientives from adjectival verbs such as in OJ *ita-* ‘painful’ > *itapar-* ‘fall ill, be pressured’, and OJ *yuru-* ‘slack’ > *yurup-* ‘become slack, relax’. There is a homophonous suffix \*-*pa-* that can be distinguished from the passive marker on the basis of its semantics and its position in the suffix chain. It has an intensive-iterative or re-iterative meaning (Unger 1977: 138) and it occurs more to the right in the chain, following the anticausative marker \*-*ra-*, such as in OJ *nagare<sub>2</sub>-* ‘flow’ ~ *nagas-* ‘let flow’ => *nagarape<sub>2</sub>-* ‘live on, live long’, OJ *motopos-* ‘make go back’ ~ *motopor-* ‘go back’ => *motoporop-* ‘crawl around’ and *utur-* ‘move, change (intr.)’ ~ *utus-* ‘move, transfer (tr.)’ => *uturop-* ‘change, shift’, whereas the passive precedes \*-*ra-* (e.g. OJ *itapar-* ‘fall ill, be pressured’, OJ *mazipar-* ‘get mixed’, OJ *umapar-* ‘be born’).

*Tungusic.* On the basis of reflexes such as Ma. *ø*, Na. *-p-*, Olč *-p-*, Ud. *-p-*, Evk. *-p-* and Even *-b-*, Benzing (1955a: 1070) reconstructs a suffix pTg \*-*p-* which he tentatively labels ‘reflexiv?’. Phonologically the reconstruction is legitimate, but since the majority of the derived verbs lack an agent role rather than marking coreferentiality of agent and patient, the

label ‘anticausative’ is more appropriate. The suffix has lexicalized in verb pairs such as Evenki *mana-* ‘finish (tr.)’ => *manap-* ‘finish (intr.)’, Evk. *ula-* ‘soak (tr.)’ => *ulap-* ‘soak (intr.)’, Evk. *sol-* ‘mix up’ => *solip-* ‘become mixed up, confused’; Even *ma:-* ‘kill’ => *ma:b-* ‘kill oneself’, *iri:-* ‘boil (tr.)’ => *iri:b-* ‘boil (intr.)’, *biri:-* ‘lose’ => *biri:b-* ‘get lost, disappear, die’ and Nanai *xoji-* ‘complete, end (tr.)’ => *xojip-* ‘end, come to an end (intr.)’, Na. *xuede-* ‘lose (tr.)’ => *xuedep-* ‘get lost, disappear (intr.)’, Na. *kala-* ‘change (tr.)’ => *kalap-* ‘change, undergo a change (intr.)’.

*Mongolic.* There is a small number of verb pairs in Written Mongolian that seem to suggest a reflexive-anticausative marker \*-*bu-* or -*if* devoiced in the liquid cluster- \*-*pu-* (Ramstedt 1912: 67- 73, 1952: 157-160, Poppe 1972: 128-134), but the evidence is too scarce to be convincing. Relics including this element \*-*bu-* may be found in pairs such as WMo. *juɣul-* ‘pull out, pluck out (tr.)’ => *julbu-* ‘shed skin, lose hair, escape’, WMo. *ura-* ‘tear, rip, bite (tr.)’ => *urba-* ‘turn back, break away from (intr.)’, WMo. *nila-* ‘smear, rub (tr.)’ => *nilbu-* ‘spit, excrete body fluids (tr. /intr.)’, WMo. *dele-* ‘wave, flap (as wings), fan (tr. / intr.)’ => MMo. *dilbu-* ‘fan (intr.)’, WMo. *delbegene-* ‘move, sway (of flat, protruding objects) (intr.)’.

A more plausible cognate is the Old Turkic reflexive-anticausative marker OTk. -*U-* in OTk. *sāš-* ‘loosen, untie, unfasten (tr.)’ => *sāšü-* ‘loosen oneself, come loose’, OTk. *adīr-* ‘separate (tr.)’ => *adru-* ‘be superior to, excel (intr.)’, OTk. *alkīn-* ‘bring to an end, wipe out (tr.)’ => *alɣu-* ‘wane (intr.)’. The suffix further derives fientives from adjectival bases (Erdal 1991: 474-479), such as OTk. *agīr* ‘heavy (in physical sense); burdensome, painful’ => *agru-* ‘be(come) heavy, be in pain, be painful’, OTk. *boš* ‘free; empty’ => *bošu-* ‘free oneself, become empty’, OTk. *kalīn* ‘thick, dense’ => *kalnu-* ‘become thick’.

### 2.3. pK \*-le-: from anticausative to passive

*Korean.* In Korean we find a number of defective infinitives, recognizable by the infinitive ending -*e/ -a* and preceded by an element -(*u*)*l-* (Ramstedt 1939: 137; Martin 1992: 219). They occur attached to the auxiliary verbs *ci-* ‘become’, that intensifies their intransitivity and *ttuli-* ‘make’, that makes them into transitives. This leads to the reconstruction of the suffix pK \*-(*u*)*l-* that can be identified as an anticausative because the derived verb denotes a spontaneous process without an implied agent in verb pairs such as in K *pes-* ‘take off, remove, slip off (tr.)’ => *pesul-e ci-* ‘peel off, come off (intr.)’, K *swuk-* ‘be drooping, be bowed, be bent’ > *swukul-e ci-* ‘hang down, droop, bend oneself’, K *sak-* ‘decay, turn bad’ => *sakul-e ci-* ‘collapse, whither, decompose’, *wuk-* ‘get bent, turn’ > *wukul-e ci-* ‘curl up, warp, be crushed out of shape’. It extends its function towards the passive in fientive derivations from verbal adjectives such as K *nwuk-* ‘be soft, be loose’ => *nwukul-e ci-* ‘calm

down, loosen up, get milder, become soft’, K *nelp-* ‘be wide, broad, spacious’ => *nelpul-e ci-* ‘spread/scatter out widely, become wide’.

*Japanese.* We can reconstruct a suffix pJ *\*-ra-*, deriving verbal meaning that excludes a causing agent and presents the situation as occurring spontaneously. Unger (1977: 140) refers to it as a marker of “spontaneous action, endo-activity”, Martin (1987: 672) calls it “endoactive (intransitive or passive)”. We refer to pJ *\*-ra-* as the anticausative polarizer in equipollent anticausative-causative pairs in *\*-ra-/ \*-sa-*. In equipollent pairs both the anticausative and the causative are derived from a neutral base by means of different markers (Haspelmath 1993). This is illustrated by verb alternations such as OJ *ok-* ‘put’ => OJ *okor-* ‘arise, happen’ ~ OJ *okos-* ‘raise, wake’, OJ *kap-* ‘transfer, exchange, buy’ => *kapar-* ‘change, be substituted for (intr.)’ ~ *kapas-* ‘exchange, shift (tr.)’, OJ *oti-* ‘fall’ (<*\*oto-ki-*) => *otor-* ‘be inferior, fall behind’ ~ *otos-* ‘drop (tr.)’, OJ *sugi<sub>2</sub>-* ‘pass by, exceed; elapse’ (< *\*sunku-ki-*) => *sugur-* ‘pass by, exceed (intr.)’ ~ *sugus-* ‘let pass (tr.)’. The suffix pJ *\*-ra-* also derives fientives from verbal adjectives, such as OJ *aka-* ‘(be) clear, bright, red’ > OJ *akar-* ‘brighten, redden’, OJ *usu-* ‘(be) thin’ > OJ *usure-* ‘get thin’ and OJ *pi<sub>1</sub>ro<sub>2</sub>-* ‘(be) wide, broad, vast’ > OJ *pi<sub>1</sub>ro<sub>2</sub>r-* ‘be widespread’.

*Tungusic.* Poppe (1972: 139-140) finds an anticausative suffix *-ra:-* ~ *-re:-* in Evenki, such as in Evk. *awga-* ‘cure, heal (tr.)’ > *awgara:* ‘recover (intr.)’, Evk. *lamba-* ‘stick, adhere to (tr.)’ > *lambara:-* ‘hold on, stick (intr.)’, Evk. *koti-* ‘to constrict, to tighten (tr.)’ > *kotira:-* ‘dry up (intr.)’, Evk. *ñekce-le:-* ‘to bend, curve (tr.)’ > Evk. *ñekcere:-* ‘to bend, bow (intr.)’. It is possible that the Manchu suffix *-ra-/ -re-/ -ro-* (Gorelova 2002: 235), that derives fientives from adjectival nouns such as in Ma. *ehe* ‘bad, evil’ > *ehere-* ‘become evil or fierce; be on bad terms with someone’, Ma. *nitan* ‘weak, diluted, light’ > *nitara-* ‘become weak, diluted’ and Ma. *sahahu:n* ‘blackish, rather black’, *sahaliyan* ‘black’, *sahaltu* ‘having a black face’ > *sahara-* ‘turn black’ is related.

*Mongolic.* Reminiscent of the equipollent anticausative-causative pairs in Japanese, Written Mongolian derives the anticausative and the causative from a neutral verb base by means of *-ra-* ~ *-re-* and *-ci-* respectively (Poppe 1954: 64; 1972: 139-140). This can be illustrated by verb pairs such as WMo. *ebde-* ‘destroy, break, ruin’ => *ebdere-* ‘break down, fall to pieces, be wrecked (intr.)’ ~ *ebdeci-* ‘break, destroy, ruin (tr.)’, WMo. *jada-l-* ‘unwrap, unroll, undo (tr.)’ => *jadara-* ‘unfold, unwrap, loosen (intr.)’ ~ *jadaci-* ‘untie, unroll, undo (tr.)’ and WMo. *nuγu-l-* ‘fold, bend, curve (tr.)’ => *nuγura-* ‘be folded, bend, stoop (intr.)’ ~ *nuγuci-* ‘fold, crumple, separate bones at joints (tr.)’.<sup>ii</sup> The suffix *-ra-* ~ *-re-* also derives fientives (Poppe 1954: 65) from nominal adjectives, such as in WMo. *köke* ‘blue’ > *kökere-* ‘become blue’, WMo. *kögšin* ‘old’ > *kögšire-* ‘become old’ and WMo. *ügei* ‘poor’ > *ügeyire-* ‘become poor’.

*Turkic.* In Old Turkic a formative *-(I)r-* (Erdal 1991: 535-538) has lexicalized into fientives that derive from verbal adjectives, such as in Otk. *süči-* ‘be sweet’ => Otk. *süči-r-* ‘become sweet’, *yili-* ‘be hot’ > Otk. *yili-r-* ‘become hot’ and Otk. *yunči-* ‘be weak, emaciated (intr.)’ > Otk. *yunčir-* ‘be put in a bad way, worsen (intr.)’. In derivations from verbs the semantic relationship between the base and the *-(I)r-* derivate is often unclear, but an anticausative interpretation seems possible in verb pairs such as Otk *äg-* ~ *äñ-* ‘bend (tr.)’ > Otk *ägir-* ~ *äñir-* ‘surround, encircle, besiege, twist, spin (tr.)’, *\*köpi-* ‘to make (sth.) froth/foam (tr.)’ in *köpik* ‘froth, foam’ => Otk. *köpir-* ‘foam, froth (intr.)’ and *\*talpi-* ‘make flutter’ in *talpi-n-* / *talpi-š-* ‘flutter (intr.)’ => *talpür-* ‘flutter (intr.)’.<sup>iii</sup>

### 3. Conclusion

Korean	Japanese	Tungusic	Mongolic	Turkic	TEA
pK *-ki- caus.-pass.	pJ *-(k)i- caus.-pass.	pTg *-ki- causative	pMo *ki- ‘do, make’	pTk *ki(l)- ‘do, make’	pTEA *ki- ‘do, make’

It appears that the passive morphology that has lexicalized in Korean verb stems is relatable to causative, reflexive and anticausative markers across the Transeurasian languages. The cognates are global in the sense that they consist of form-function matches. As far as the form is concerned, are the phonological correspondences between the suffixes regular. They confirm the correspondence series for *\*-k-*, *\*-p-*, *\*-r-*, *\*-i-*, *\*-u-* and *\*-a-* established on the basis of lexical cognates in our previous research (Robbeets 2005). The functional matches obey to the cross-linguistic tendencies in grammaticalization, described in the first section of this article.

It is clear that the correspondences are too regular and too involved to be motivated by sheer chance or by universal principles in linguistic structuring. Nevertheless, one question remains: are the shared properties generated by genetic retention or are they generated by borrowing?

Since the present article compares bound inflectional verbal morphology, the probability of borrowing is relatively low to begin with. Second, diathetical suffixes are thought to be

particularly resistant to borrowing due to their positions close to the verbal stem and they tend to lexicalize easily due to their high semantic content. Third, the matches are not only global form-function matches, they also include shared polyfunctionality, such as causative and passive or anticausative and reflexive. And finally, the correspondences stretch over five branches. Linguistic and geographic distance can help to rule out borrowing. If one intends to study Korean from a genealogical perspective, it is rather risky to engage in a binary comparison with Japanese. The reason is obvious: both languages are geographically adjacent and they stand in a high-borrowing relationship. Borrowings are expected to obscure the underlying genetic connections. Hence, they will be mistaken for cognates. If we start from the largest reasonable hypothesis and test a model including languages that stand in a low-borrowing relationship, such as the Turkic languages, we reduce the probability that we are dealing with borrowings in disguise.

We are lead to the conclusion that it is more likely that the passive morphology shared between Korean and the Transeurasian languages is the result of genetic retention than that it is induced by language contact. The etymologies presented in this article indicate that Korean is relatable to Japanese, the Tungusic languages, the Mongolic languages and the Turkic languages in a genealogical sense.

### **Abbreviations**

Az.	Azerbaijani
Bao.	Bao'an
Bash.	Bashkir
Bur.	Buriat
Chu.	Chuvash
Dag.	Dagur
Dolg.	Dolgan
Dong.	Dongxiang
Evk.	Evenki
J	(standard Tokyo) Japanese
K	(standard Seoul) Korean
Kalm.	Kalmuk
Khal.	Khalkha
Khak.	Khakas
Kirg.	Kirghiz
Ma.	Manchu

MK	Middle Korean
MMo.	Middle Mongolian
Mgr.	Monguor
Mogh.	Moghol
Na.	Nanai
Neg.	Negidal
Nog.	Noghay
OJ	Old Japanese
OTk.	Old Turkic
pJ	proto-Japanese
pK	proto-Korean
pMo	proto-Mongolic
pTEA	proto-Trans-Eurasian
pTg	proto-Tungusic
pTk	proto-Turkic
Sol.	Solon
Tat.	(Volga) Tatar
Tk.	Turkish
Tkm.	Turkmen
Ud.	Udehe
Uigh.	Uighur
Uzb.	Uzbek
WMo.	written Mongolian
Yak.	Yakut
